United States—LOCKWOOD TRADE JOURNAL Co., 10 East 39th-street, New York.
Representatives also in Australia, India, South Africa, Canada, etc.

THURSDAY, JULY 5, 1923.

Lithographic Progress.

THE importance of the lithographic section of the printing industry deserves rather more attention than it has been accustomed to. Those engaged in it are enthusiastic enough, but their activities deserve more of the light of day to illuminate them. In recent years great developments have been made and still more are foreshadowed. The possibilities of extending the art are enormous if only the opportunities are accepted. In the past the *British and Colonial Printer and Stationer* has given useful information concerning lithography and the activities of those engaged in it. We hope to do more in the future, and it is proposed to devote a section of the first issue each month to the subject. This week the special article by Mr. Joseph Goodman gives a good start with a historical basis and some notes on page 9 record current trade movements. It is hoped to extend these features and to give an uplift to lithography.

* * *

State Printing.

MASTER printers have every justification for being amazed that the Stationery Office, just when an inquiry is to be opened into the question of State printing, should take the work of printing the *London Gazette* away from a private firm. For the 250 years the *Gazette* has been issued, it has been printed by private firms under contracts obtained by tender. In a statement by the Federation of Master Printers it is pointed out that questions asked in the House of Commons prove that the Stationery Office cannot promise any reduction in the cost of production, and it is certain that the works under their control are not better fitted for the work than those of very many private firms throughout the country. Following the precedent set up of late in other cases, the Stationery Office has transferred this contract without obtaining competitive prices from private firms. The proportion to which printing in Government works has now attained is causing considerable alarm, particularly in view of the fact that the financial statement so far issued in respect of the State works shows that a considerable loss has been made. "It is significant," the statement concludes, "that the Prime Minister, speaking at the Hotel Cecil, referred to the growth of State trading that had taken place during the war period. He added, 'There is a tendency to-day among the people of this country to lose sight for the time being of that initiative and that individuality which alone has made this country what it is.'" As the Federation observe, it is indeed strange that with a Prime Minister holding such views on the eve of this inquiry commencing its labours important contracts should be removed to State establishments.

* * *

Printers' Wage Reduction.

IN accordance with the National Wage Settlement made in July last, the last reduction in wages to take place this year becomes operative on the pay-day in the week ending July 7th. The reductions from the male members of the Binders' and Rulers' Unions are 2s. 6d. per week; from the women and male junior members of the Binders' Rulers' and Paper Workers' Unions and the N.S.O.P. and A., 1s. per week, and from learners 6d. per week. With regard to the members of the Amalgamated Society of Lithographic Printers and the Amalgamated Society of Lithographic Artists, Designers, etc., an agreement has been arrived at with these two societies whereby London is included in the National Wage Agreement. It has been agreed that the minimum rate for London shall be 5s. above the rate for Grade 1, and that this arrangement shall come into operation on the pay-day in the week ending July 7th. This will, therefore, mean that no alteration in the wages of members of these two unions will be made on the above-mentioned pay-day.

Lorilleux and Bolton, Ltd.

Students Visit Famous Printing Ink Factory.

The students of the London School of Printing Course for the sons of master printers paid a visit to the factories of Messrs. Lorilleux and Bolton, Ltd., on the June 26th, 1923. The party was received at Cursitor-street by Mr. H. C. Bolton, who, on behalf of the firm, extended a hearty welcome to the students. A tour of the various departments was made, the visitors being much impressed by the scientific thoroughness everywhere apparent, even in the smallest details. They evinced particular interest in the demonstration of the "Frequentia" Lamp for testing the permanency of coloured inks.

From Cursitor-street the party was conducted by charabanc to the extensive factories at Stratford. Here, by the hospitality of the firm, the students partook of tea, and each was presented with a souvenir portfolio of specimens representing some of the inks manufactured. The factories were then thoroughly toured—oil sheds, varnish-rooms, laboratory, grinding and mixing, engineering shops and printing department—and all proved of entrancing interest to the students. They were greatly indebted to the guides for the courtesy and attention shown; their lucid explanations making the visit one of exceptional educational value.

The visit was much appreciated, and the students came away with a greater insight into the care which must be exercised in the manufacture of printing inks suitable for modern requirements.

THE Newspaper Society was responsible for a collection of £1,593 to the special Diamond Jubilee effort of the Newspaper Press Fund.

Personal.

THE Honorary Freedom and Livery of the Worshipful Company of Stationers was conferred upon Sir Israel Gollancz, Litt.D., F.B.A., at a Court held on Tuesday, in recognition of his services on the occasion of the First Folio Tercentenary Commemoration.

SIR JOHN LE SAGE, who retired on Saturday from the editorship of the *Daily Telegraph*, after a service with the paper of 60 years, contributed an interesting article of recollections to Saturday's issue. A leader also appears full of gratitude and admiration of unique service.

THE Institute of Journalists has invited Sir John to a complimentary luncheon on the occasion of his retirement from active journalistic work.

MR. FRANK LLOYD has sent a cheque for £250 towards the £20,000 required by the Kent County Ophthalmic Hospital.

THE name of Pomeroy Burton, well-known in newspaper circles, appeared in the list of Knights in Saturday's Birthday Honours.

MR. THOMAS MOLES, who is a member of the editorial staff of the *Belfast Telegraph* and the first working journalist to be appointed to the Privy Council in Ulster is Deputy Speaker of the Parliament of Northern Ireland.

MR. GEORGE C. CURNOCK, for many years associated with the *Daily Mail* has been appointed editor of the *Referee*, and is now responsible for the direction and policy of the paper.

MR. FRANK COLEBROOK, F.A.I., will give an address on "Points to Watch in Wear and Tear" at the meeting of the North London Branch of the L. M. P. A. at the Central Library Hall, 89, Holloway-road, N., this (Thursday) evening.

SIR ALBERT SPICER was recently presented by the Rev. Sidney Berry, chairman, on behalf of the trustees of the Mansfield College, with a handsome address in recognition of his services as treasurer since 1890 until his resignation last year.

SIR ALBERT, in reply, drew attention to the fact that it was through a remark of his to Dr. Dale in 1883 or 1884 that the college was removed from Spring Hill, Birmingham, to Oxford.

MR. JAMES CRANE has just completed his 56th year with John Tod and Son, Ltd., St. Leonard's Mill, Lasswade, Midlothian. Eighty years of age, he has worked under three generations—Mr. John Tod, his father and his grand-father—and is still in active employment.

MR. J. H. FREEMAN, an assistant editor of the *Yorkshire Observer*, who is leaving Bradford to take up an appointment in London on the *Daily Graphic*, has been presented with a silver-plated tea service by his colleagues.

MR. A. T. HALE, who is relinquishing the position of editor of the *Bradford Daily Argus*, a post he has held for many years, has received from his colleagues on the staff a case of cutlery suitably inscribed.

MR. EUGENE E. MEURER, millionaire paper manufacturer, of Muskegon, Michigan, has married Miss Margaret Wasserman, his "40,000 dollar cook," whose specially-prepared dishes Meurer repeatedly declared meant "life itself" to him.

MR. MEURER gave his age as 62, and that of his bride as 42. Efforts have been made to keep the marriage a secret. The millionaire's fondness for the woman's cooking led to a break between Meurer and his family. Meurer is suffering from a chronic stomach ailment and declares his new wife's cooking is indispensable if he is to live.

The Lithographic Trade.

Notes and News.

SOME interesting movements are on foot on the lithographic side of the printing industry. To begin with, it is good to learn that a slight improvement in trade has been experienced among members of the section during the past week or two, and at the same time a satisfactory lessening of unemployment has been notified.

WE understand that an agreement for a common understanding has been arrived at between the Amalgamated Society of Lithographic Printers and the Amalgamated Society of Lithographic Artists all over the country. The understanding thus effected is believed to be for the mutual benefit of both associations. Although amalgamation is not yet a practical proposition, it is thought that the agreement now existing between the two organisations can be looked upon as an important step in that direction.

Mr. Thomas Sproat, in the report of the Amalgamated Society of Lithographic Printers for the half-year ending 1922, speaks with enthusiasm of the efforts which are being brought to a conclusion to bring artists and process workers into closer connection with the Society.

The report shows a membership of 6,318, which is a loss of 342 members compared with a year ago. Business during that period was so slack that 1,786 members received out-of-work benefit. The total amount paid out is given at £9,699 18s. The sum paid to sick members amounted to £1,080 9s. 11d. Superannuated members received in benefits the amount of £3,391 3s. 6d., whilst death claims amounted to £419 1s. 11d. The total funds of the Society at the end of the year showed the sum of £59,755 13s. 2d.

WE learn that the agreement in reference to the wages of lithographers has been ratified by the London branch of the Amalgamated Society of Lithographers and the Master Printers' Federation. This provides that no further reduction in wages shall take place, and means that the reduction which was to take effect at the end of this week, has been cancelled, while no further demands for a reduction can be put forward during the existence of the present agreement.

EFFORTS are well in hand with regard to the Lithographers' Auxiliary concerts to take place in the autumn, and Mr. J. Mynott, the untiring auxiliary secretary, and his committee, are working hard to secure a full programme for the coming session.

THE current number of the *Modern Lithographer* marks an epoch in trade history, being the first printing journal in the world to be produced entirely by photo-litho offset. We congratulate the publishers and proprietors on their very excellent venture.

PRINTED books, papers and music imported into New Zealand during the eleven months ended November were of the value of £362,000. This figure compares with £370,000 in the eleven months of the preceding year, and £476,000 during January to November, 1920.

PRINTED books entering British South Africa in the eleven months ended November were of the value of £315,000, contrasted with £336,000 in the corresponding period of the previous year, and £400,000 in the eleven months of 1920.

FOUR VICIOUS CIRCLES.—Mr. Arthur Balfour, President of the Association of British Chambers of Commerce, speaking at Wolverhampton, said we were still moving in four vicious circles—high taxation, excessive expenditure, bad trade, and international debt. The most urgent problem of to-day was that of reparations and the occupation of the Ruhr which it involved. This country had undergone a terrible strain, and we were still suffering, but we had cleared up our troubles better than any other nation in the world.

YOUR reputation will outlast your riches. Put reputation first.

Trade Union Matters.

TYPOGRAPHICAL ASSOCIATION AND PIECEWORK.—The general secretary of the Typographical Association (Mr. H. Skinner), in reply to a communication from the secretary of the Yeovil Branch, stating that it was proposed to institute a system of piecework in that branch, states that such an alteration is against the rules of the Association ordered by the Aberystwith delegate meeting, and that no extension of piecework can be permitted. The Executive Council have given approval to the reply.

THE DE LA RUE DISPUTE.—Negotiations for a settlement have been opened between the London Printing and Kindred Trades' Federation and Messrs. Thomas De La Rue and Co., and we understand, from information that has reached us, that a speedy settlement is imminent.

T.A. AND WAGES INCREASE.—The South-Western Group of the Typographical Association have passed unanimously a resolution that the Executive Council of the Association be urged to make immediate preparations for a wages increase movement, with a view to such becoming operative at the expiration of the present agreement. The mover of the resolution stated that the best way to counter-attack any agitation by the employers to reduce wages was to ask for an increase.

L.S.C. UNEMPLOYMENT AND OVERTIME.—According to the unemployment returns published in the *L.T.J.* the number of L.S.C. members signing the out-of-work book on the week ending June 23rd stood at 769, against 762 on June 16th, 756 on June 9th, and 781 for the week ending June 2nd. The members signing-on on June 23rd, 1922, represented 1,041, whereas in the corresponding week of 1921 the number stood at 1,169. The total number of hours worked during June in the general printing trade amounted to 58,544 (divided amongst 5,464 men), while the total number of hours worked in the news section reached 11,565, for which 1,191 men were responsible.

Paper Workers' Agreement.

Conference in Manchester.

The Joint Negotiating Committees of the two unions met the Employers' Committee at the Midland Hotel, Manchester.

The matter of the entirely unauthorised lightning strike of a section of the workers at Ramsbottom mill on the 19th ult. was raised by the employers and reports were given by the manager and Mr. W. Ross, general secretary papermaking section of the N.U.P.B. and P.W.

It was agreed that a notice be put up at the mill intimating that the case had been dealt with by the management and union representatives and that the mill would re-open on the Monday and that immediately after resumption of work full investigations by the union officials of the members' grievances would take place at the mill along with the management.

Certain points relating to the terms arrived at in the Valleyfield strike settlement were also ventilated by the National Union representatives.

The conference then took up consideration of the first two paragraphs of the employers' proposals, which were as follows:—

"Insert in the proposed new Agreement a provision that no prejudice or disability shall attach to membership or non-membership of a trade union."

"DISPUTES.—A dispute in a paper mill or allied business shall not be made the ground of interference with the normal business of another mill or establishment."

The meaning of these were defined by Mr. C. R. Seddon, president of Employers' Federation, and one or two other employers, and in reply Mr. G. Harraway, as chairman of the Joint Committee, intimated that the proposals were very objectionable to the unions, and were entirely unnecessary in the members' opinion. He had most definite instructions that unless they were withdrawn the union representatives could not proceed to consider any new agreement of which any such proposals formed part.

The conference was adjourned.

MECHANICAL ADS, LTD. (London).—Debenture dated June 15th, 1923, to secure £1,900, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Major J. L. Willcocks, D.S.O., M.C., Stock Lodge, Stock, Essex.

FERRESTONE PRESS, LTD. (London).—Satisfaction in full on June 5th, 1923, of debentures dated January 26th, 1910, and February 6th, 1911, securing £300 and £200 respectively.

FERRESTONE PRESS, LTD.—Particulars filed of £8,500 debentures authorised June 15th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present ssue being £4,500.

GOLDSCHMIDT, HAYES, AND SMITH, LTD. (Stationers, etc., Nottingham).—Satisfaction in full on May 17th, 1923, of debentures dated April 24th, 1902, securing £3,000.

NEW LEADER, LTD. (London).—Issue on May 28th, 1923, of £1,250 debentures, part of a series already registered.

PASCALL'S, LTD. (Billposters and advertising contractors, London).—Satisfaction in full between October 6th, 1903, and March 2nd, 1922, of debentures dated May 11th, 1903, securing £1,500. (Notice filed June 14th, 1923).

ENOCH AND SONS, LTD. (Music publishers, London).—Particulars filed of £25,000 debentures (entitled to 5 per cent. bonus on redemption), authorised June 6th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital (subject to mortgage on leasehold premises), the amount of the present issue being £9,500.

LIBRACO, LTD. (London).—Particulars filed of £1,500 second debentures authorised June 1st, 1923, charged on the company's undertaking and property, present and future, including uncalled capital (subject to £2,500 prior mortgage debentures), the whole amount being now issued.

BANKRUPTCIES, etc.

Re BRUCE OSWALD CHAPMAN, 37, Essex-street, Strand, printer, publisher and general merchant.—This bankrupt, who failed last January, applied on June 27th at the London Bankruptcy Court for an order of discharge. The official receiver reported that the applicant in November, 1920, purchased for £190 the stock, furniture and effects of the above business, which he continued under the style of the "Commercial Typewriter Exchange" and "B. A. Chapman and Co." until November, 1922, when it was acquired by a company, which discharged the existing liabilities and of which he acted as a director, without remuneration. He attributed his failure to having given acceptances for £500, without receiving any consideration, that being his only liability. The assets were not expected to realise more than £15. Mr. Registrar Hope granted a discharge subject to a judgment for £35, to be satisfied by an immediate cash payment.

Re T. HEAD AND CO., LTD., manufacturers of cardboard boxes, 4, Regent-street, S.W. Under the compulsory liquidation of this company accounts have been lodged showing liabilities £764 against assets valued at £142 and a deficiency of £3,022 as regards contributories, the issued capital being 20,000 ordinary shares of 1s. each, and 1,400 preference shares of £1 each. Mr. J. Barwick Thompson, official receiver, reports that the company was formed in October, 1921, with a nominal capital of £3,000, to acquire as a going concern and carry on the business of cardboard box and fancy goods manufacturers carried on by R. Shaw and W. Popkin, trading as T. Head and Co., at 322, Upper-street, Islington. The purchase price was agreed at £2,439. The failure is attributed to lack of sufficient capital, inability to obtain credit and the general depression in trade. The liquidation remains in the hands of the official receiver.

Re SKINNER, BRIERLEY AND CO. (George Francis Skinner and Henry Walter Brierley, trading as), wholesale stationers and paper merchants, 22, Great James-street, Bedford-row, W.C.—This firm failed in March, 1922, and on Tuesday the partners applied to Mr. Registrar Mellor at the London Bankruptcy Court for orders of discharge. Mr. Armstrong, official receiver, reported that the provable debts amounted to £1,007, and the only asset recovered was 14s. 2d., the proceeds of unused cheques. The bankrupts entered into partnership on March 12th, 1920, and traded at 176, Fleet-street; the debtor Skinner provided a cash capital of £950, and Brierley contributed £100 and his connection and experience. In September, 1920, they removed to Great James-street. Brierley fell ill in May, 1921, and was unable properly to attend to the business, and in February, 1922, the landlord seized and sold the stock and furniture, whereupon the trade ceased. The failure was attributed to depreciation in the value of stock, slump in trade, illness of the debtor Brierley, and insufficiency of capital. The offences reported were insufficiency of assets to equal 10s. in the £ on the amount of the liabilities, and trading with knowledge of insolvency. The discharge of Brierley was suspended for two years, and that of Skinner for two years and six months, a previous arrangement with creditors being also reported against that bankrupt.

From the London Gazette.

PARTNERSHIPS DISSOLVED.

T. Sapt and D. Berry, under the style of Berry's Advertising Agency, 24, Essex-street, Strand, London.

R. S. Allwood and L. Wain, under the style of Allwood and Wain, printers, Bradgate-road, Anstey, Leicester.

Ernest S. Cook and Thomas A. Godfrey, wholesale stationers, 82, Queen-street, Cheapside, E.C.

John Halstead, sen., Angus Halstead, and John Halstead, jun., under the style of Halstead and Sons, printers, 37, Castle-street, Carlisle, so far as concerns John Halstead, sen.

Arthur Maule, and Thomas C. Smith, printers, bookbinders, etc., 36a, Clarence-street, Kingston-on-Thames.

BANKRUPTCY ACT, 1914.

RECEIVING ORDER.

J. A. Sykes, 29, Malpas-road, Wallasey, rope, twine and paper dealer.

Norwegian Strike.

Serious Threat by Employers.

The strike in the Norwegian pulp and paper mills continues, and 14,000 persons are idle. It does not appear to be yet understood how serious the crisis is. Opinion is equally divided between those who believe that the stoppage will be of short duration and those who take the opposite view.

An important principle is at stake. Although it arose out of the action of but 19 wood floaters who had been on strike for two years, it threatens to involve many industries in Norway. These men, it appears, refused to recognise a Government arbitrator's award, and if they, with the assistance of the pulp and paper workers, should gain their point, there would be no virtue in any arbitration in the future.

An attempt to force the matter to an issue is being made by the employers in other industries, who threaten, unless the sympathetic strike is settled by July 6th, to declare a lock-out in saw mills, textile works, chemical plants, etc., affecting a similar number of men to those out in the paper industry.

If a settlement should be reached by July 6th the effect of the stoppage will not be so serious. But there is no evidence that there will be so prompt an arrangement. With a continuance of the strike after that date, the position in the pulp and paper market will become serious.

In the meantime it is stated that the authorities are endeavouring to bring the parties together.

Involved with the sympathetic strike is the question of the wages agreement which terminates in August. The employers agreed to take this matter into consideration now, but the workpeople declined and, instead, decided upon the strike.

Negotiations Re-opened.

A wire from Norway on Thursday morning stated that negotiations were resumed on Wednesday afternoon, and mills seem optimistic that a settlement may be reached.

Albert E. Mallandain, Ltd.

Important Paper Amalgamation.

Albert E. Mallandain, Ltd., was registered as a private company on June 23rd with a nominal capital of £150,000, in £1 shares (40,000 "A" cumulative 6 per cent. preference, 40,000 "B" cumulative 10 per cent. preference, 68,000 ordinary and 2 000 employees'), to acquire (1) the business of a paper manufacturer and dealer, etc., now carried on by A. E. Mallandain, of Park Royal Paper Mills, Park Royal, Middlesex, and King's House, King-street, E.C.; and (2) the business of paper manufacturers and merchants formerly carried on by the Forester Paper Co. (1917), Ltd., at Victoria-road, Acton, W., Foresters' Hall-place, Clerkenwell, and King's House, E.C.

The permanent directors are A. E. Mallandain (managing director), 4, Whitehall-court, S.W., and S. Farrow (general manager), The Red Cottage, Slough, Bucks. The registered office is at King's House, King-street, E.C.

Wm. Tod, Junr., and Co. (1923).

William Tod, Junr., and Co. (1923), Ltd., was registered in Edinburgh on June 14th as a public company with a nominal capital of £190,000 in 120,000 preference and 70,000 ordinary shares of £1 each, to carry on the business of manufacturers of and dealers in paper and paper goods of all kinds.

The first directors are: W. L Tod, Glenesk, Polton, Midlothian, paper manufacturer; A. K. Tod, St. Ann's Mount, Polton, Midlothian, paper manufacturer; J. A. Hood, Midfield, Lasswade, Midlothian, colliery owner; J. W. F. Lowson, Quarwood, Stow-on-the-Wold, Gloucestershire, managing director of Hendon Paper Works; A. H. Lymn, Abbot's-court, Kensington-square, London, W.8, chemical engineer; and W. Hunter, Breezehill, Roslin, Midlothian, engineer.

The registered office is at Springfield Mill, Polton, Midlothian.

Continental Paper Companies.

FRANCE.

Papeteries de l'Ouest.—Profits for the past year 264,119 francs, against 263,160 in 1921; dividend of 15 francs per share proposed.

BELGIUM.

Papeteries Anversoises.—The account for 1922-23 closed with a profit of 3,023,372 francs, against 2,281,862 francs in 1921-22; dividend 31·16 francs.

Papeteries Navarre.—Profits for 1922, 3,093,572 francs, against a loss of 2,283,821 francs in the previous year.

PAPETERIES DE SAVENTHEM, Belgium, realised profits last year of about 28,111,063 francs, whereas there was a loss of 1,215,656 francs in 1921. A dividend of 30 per cent. is to be paid.

Harold Spalding and Co.

Important Addition to Their Mill Agencies.

Messrs. Harold Spalding and Co., of 56, Ludgate-hill, are to be congratulated upon having been appointed sole London agents for Messrs. Y. Trotter and Son, Ltd., Chirnside Bridge Paper Mills, the well-known manufacturers of esparto papers. In transferring their London representation to Messrs. Harold Spalding and Co., Messrs. Trotter have selected a firm which has confined its business to *bona fide* mill agency without trying to attach to it the somewhat conflicting interests of merchants.

Both Mr. Harold Spalding and his partner, Mr. William Sommerville, have from their earliest days been closely associated with paper mills in this country, and their sympathies are naturally with the manufacturers.

This new acquisition gives Messrs. Spalding command of a very wide range of papers. Through their agency for the Team Valley Paper Mills, Ltd., they are able to offer mechanical M.F. and super-calendered printings, tinted papers, folding middles for boxes and parchment papers. The Olives Paper Mill Co., Ltd., another of their representations, produces wood free printings and cream laids, banks and cartridges and their old speciality, genuine black papers. The Golden Valley Paper Mills, for whom they also act, are noted for tub-sized, air-dried writing papers, and high-class E.S. writing papers. Messrs. P. Garnett and Sons, Ltd., whom they have represented for many years, provide them with M.G. papers, especially those suitable for envelopes, tinted papers, M.G. and glazed, tinted covers, label manillas, buff-tinted and other grades. They have also added to their agencies Messrs. Wm. Harvey and Son, of Romsey, who turn out a sound quality of brown. Now, to complete a very excellent assortment, they have added to their representations a mill which makes the highest quality of esparto papers at Chirnside.

Since Mr. Harold Spalding started in business for himself in 1901, he has made continual progress. Within the first six months he had acquired the representation of three mills, and in 1903 he was joined by his partner, Mr. William Sommerville, a director of W. and J. Sommerville, Ltd., who owned the Golden Valley Paper Mills before they were taken over by Mr. Charles King Smith.

The business was originally started at 101, Fleet-street, with quite modest premises, but they soon had to take larger offices at 12, St. Bride-street. These in turn the business outgrew, and in 1919 the firm went into 56, Ludgate-hill, where their well-arranged offices permit of the rapid discharge of their manifold activities.

Last year they celebrated their twenty-first anniversary, when the staff, several of whom have been with the firm for 16 years, were entertained for a day on the river, the affection and esteem in which Mr. Harold Spalding and Mr. William Sommerville are held being demonstrated by gifts as mementos of an interesting occasion.

The acquisition of the agency of the Chirnside Bridge Paper Mills indicates that there is no diminution in the enterprise of Harold Spalding and Co., who still adhere very rigidly to their paper mill agency business, and it is to his strict attitude in confining himself to the wholesale trade that Mr. Harold Spalding attributes his success.

Reed and Smith's Developments.

Messrs. Reed and Smith, Ltd., the well-known paper manufacturers, of Cullompton, Devon, have added to their group of mills the Stoke Canon Paper Works, near Exeter, the firm having obtained a controlling interest in Messrs. Fredk. Tremlett and Co., Ltd. Messrs. Reed and Smith's London offices are at 4, St. Paul's-churchyard, E.C.4, and in future the sales of the output of Stoke Canon Paper Works will be conducted through this office. It may be mentioned that Mr. Chas. Tremlett will still take an active interest in the company, and the manufacture will be under his direct supervision as heretofore.

East Lancs Paper Mills.

Recreation Club Gala and Opening of Sports Pavilion.

The second annual gala was held on the 23rd ult., when the handsome new sports Pavilion, which has been so generously erected by the directors of the firm for the benefit of the employees, was formally opened by Mrs. C. R. Seddon. The grounds were tastefully decorated with flags and bunting, and the arrangements made by the club officials were all that could be desired. An interesting sports programme had been arranged and great amusement was caused by the side shows, the lady palmist being specially well patronised. The Radcliffe Brass Band was also in attendance and gave selections during the afternoon, and played for dancing in the evening. The sports commenced at 2 p.m. and at 3.45 p.m. there was an interval, during which the ceremony of opening the new pavilion took place.

Description of the Building.

The pavilion is 76 ft. in length and 47 ft. wide, with a verandah in front, which projects 9 ft. out from the main building. The walls are built of stock bricks and the roof is covered with red asbestos tiles. A pleasing effect is secured by two small half-timbered gables at the ends, and a small gable placed centrally on the front of the building. The verandah, which is one of the chief features, is 45 ft. long by 11 ft. wide at its widest point, and is supported by wood pillars surmounted by a moulded cornice. A wood balustrade is formed along the front and sides. The outside of the building is painted in black and white. The inside is divided into three portions. The central portion forms a large hall 43 ft. by 38 ft., which has a maple boarded floor, and can be used for dancing or parties. This large room is further divided into three separate rooms (by means of panelled partitions which are movable), ladies' room, gentlemen's room and club room. The two ends of the building are divided into ladies' and gentlemen's dressing rooms, bath rooms, lavatories, billiard room, bowl house, kitchen, and pantry. The rooms have panelled walls and ceilings, and a boarded dado is carried around the large room and billiard room to about 4 ft. high. All the inside woodwork is stained and varnished. The floors and walls in the bath-rooms and lavatories are tiled. An efficient system of heating and ventilation is installed, and the building is lighted throughout with electric light. The photograph of the gathering at the opening ceremony was taken in front of the pavilion

Alderman T. S. Collinge, J.P. (chairman of the board of directors) presided at the opening gathering and the following ladies and gentlemen were present:—Mr. C. R. Seddon, J.P. and Mrs. Seddon, Mr. and Mrs. John Seddon, Mr. and Mrs. W. Kirkham, Mrs. Wood Collinge and Master Tom Collinge, Mrs. Taylor, Mr. and Mrs. A. Ogden and the Misses Ogden, Mr. and Mrs. J. Prestwich, Mr. and Mrs. W. Kirkham, Mr. and Mrs. T. W. Leigh (Liverpool), Mr. R. Smith (Hyde), Mr. and Mrs. E. Baguley (Macclesfield), Mr. and Mrs. R. Monks, Mr. and Mrs. W. E. Walsh, Mr. and Mrs. J. R. Etheridge, Mr. and Mrs. Jas. Balshaw, Mr. John Kirkham, Mr. W. Ross (National Union of Printing and Paper Workers), Mrs. Bridge (organiser of the Women's National Union) and Mr. J. Pearson.

OPENING OF THE EAST LANCS MILL SPORTS PAVILION.

North v. South.

Mr. A. Dykes Spicer, late captain of the Paper Trade Golfing Society, took a team North at the invitation of Mr. E. W. Allen, to play a friendly match against a team representing the paper trade in the North, captained by the latter.

Mr. C. R. Seddon very kindly entertained both teams and the match took place on the Birkdale links, which, together with Formby, rank almost equal in importance to the famous Hoylake course.

Singles were played in the morning and foursomes in the afternoon. Scores:—

SINGLES.

North.		South.	
E. W. Allen (2 and 1)	1	A. Dykes Spicer	0
F. Marshall	0	A. S. Duff (1 up)	1
Norman Duxbury	0	Harrison Savory (3 and 1)	1
R. K. Kirkpatrick	½	R. G. Harvey Greenham	½
J. Seddon (2 and 1)	1	F. A. Skerratt	0
A. Lucas	0	R. G. Varcoe (5 and 4)	1
H. B. Brindle	0	G. Buchanan (8 and 7)	1
T. A. Colclough Leete (7 and 6)	1	G. W. Shilcock	0
	3½		4½

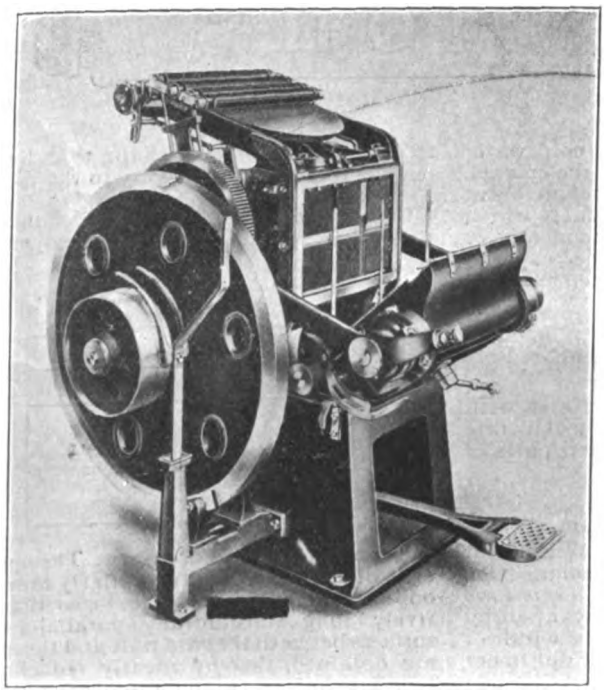
FOURSOMES.

Allen and Duxbury	½	Spicer and Savory	½
Leete and Marshall (4 and 3)	1	Duff and Shilcock	0
Seddon and Kirkpatrick (1 up)	1	Greenham and Varcoe	0
Brindle and Lucas	0	Skerratt & Buchanan (4 and 3)	1
	2½		1½

The teams thus had a total of 6 points each to their credit, and were all square on the day's play, which was of the most enjoyable nature.

New Zealand Customs Decisions.

Cardboard Box-Making Machinery, etc.



Customs decisions regarding the classification of certain articles under the New Zealand Customs Tariff have been issued by the Minister of Customs. The rates of duty on cardboard box-making machinery specified below are as follows: British Preferential Tariff, free; Intermediate Tariff, 5 per cent. *ad valorem*; General Tariff, 10 per cent. *ad valorem*. The machinery specifically concerned is thus described: Corrugating roll glueing machine, for glueing paper wrappers used in box-making; lacing and fly-leafing machines for attaching paper lace, etc., to cardboard and other boxes; wrapping machine for use in making loose-wrapped lids.

Under the heading of educational apparatus, blackboards, silicate, being paper pulp boards with a coating of specially prepared paint on each side, bear the following rates: British Preferential Tariff, free; Intermediate, 10 per cent. *ad valorem*; General, 15 per cent. *ad valorem*.

Serviettes or d'oyleys of paper, unprinted, or printed only with floral or similar designs: British Preferential Tariff, 20 per cent. *ad valorem*; Intermediate, 30 per cent. *ad valorem*; General, 35 per cent. *ad valorem*.

PRICES of Austrian paper make it almost impossible to compete in the world's markets.

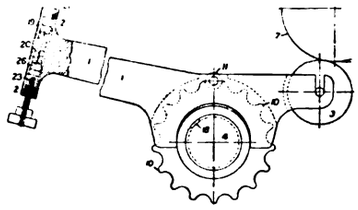
New Inventions

Feeding Sheet.

In an invention by the Cross Paper Feeder Co. sheets are fed to printing and like machines by forwarding devices moving at a constant high speed which is maintained until the front stops are nearly reached, the sheets are then slowed down quickly and released before the stops are reached, the sheets being grasped by their front edge and drawn against the stops. The sheets are separated by known means, such as combing rollers, forwarded by constantly driven rollers 4 coacting with drop rollers 2 mounted in lever arms 10, and are finally fed by rollers 12, 14 driven at the same speed as the rollers 2, 4. The rollers 14 are mounted in resilient arms 48 which can be depressed by cam,



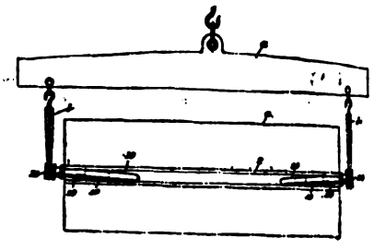
lever-and-link mechanism to release the sheet. There are two rollers 12 symmetrically arranged on a constantly driven shaft 21 provided with hubs about which segment rolls 18 are freely mounted, and oscillated by cam and lever mechanism. The rolls 18 also co-operate with the pressure rolls 14, and are of larger diameters than the rolls 12, so that when the sheets are gripped between the segments 18 and rolls 14, the rolls 12 are out of action. The rolls 18 are given a variable motion and soon decrease the speed of the sheet, until it is nearly at rest. The sheet is then seized by grippers 20 carried by a reciprocating rod 82, and is carried by the grippers against the front stops 16. The grippers are opened to take the sheet by pins 86 on the front stops acting on arms 88 projecting from the upper jaws of the grippers.

Printing Surfaces.

An invention by Mr. A. R. Trist relates to printing surfaces of the kind having ink-repelling areas of mercury or mercury amalgam, and consists in applying gold or other metal having a greater affinity for mercury than the metal of which the printing surface is composed, to prevent diffusion and evaporation of the mercury. A sheet of metal to which mercury will adhere or with which it will amalgamate, or a sheet of material coated with such a metal, is provided with a coating of bichromated fish glue enamel, exposed behind a positive transparency of the required design, and washed with cold water to remove the unaffected parts of the enamel. The remaining parts of the enamel are burnt in, and a layer of iron or other metal to which mercury will not adhere is chemically or electrolytically deposited on the exposed metal. The burnt-in enamel is then removed by caustic alkali, and the metal thereby exposed is treated with mercury with which gold is afterwards associated by applying a solution of a salt of gold. According to the Provisional Specification, a sheet of copper, or of iron coated with copper, is printed with the design in a resist, and a solution of nitrate of mercury applied to the unprinted parts of the surface of the sheet.

Paper Cutting Mechanism.

In an invention by Mr. H. W. V. Wilson and the Victory Kidder Printing Machine Co., Ltd., rotary disk cutters 3 held on levers 1 are pressed against a cylinder 7 by a spring device 2 and are adjusted over the width of the web by wheels 10 threaded for adjustment on a screwed shaft 4. The lever 1 is formed to engage the boss of the wheel, which latter



is locked in adjusted position by a roller 11 carried on the lever. A scale 18 on the shaft facilitates the adjustment. The spring device 2 comprises a cylinder 19 containing two keyed pistons 21, 26, separated by a spring 20, the pressure on the piston 21 being adjusted by a screw 23 with a serrated end. A number of the arms 1 with cutters 3 are mounted on the shaft 4 and their spring devices are engaged by a cam bar extending across the machine. In place of the cutting disks 3 perforating tools may be used.

Moving Rolls of Paper.

In moving heavy rolls of paper by means of a crane, it is customary to insert bars suspended from the crane into the ends of the openings in the paper rolls. Owing to the weight of the rolls and the leverage exerted, these bars frequently mutilate the paper about the openings, or break down the cores. The object of a device by Mr. Howard Parker is to provide bars of such shape that the rolls may be lifted without injury to the paper or the core.

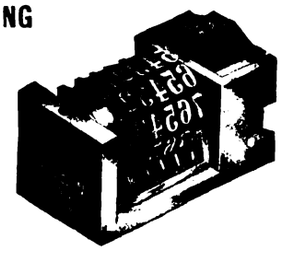
Each of the bars is provided with a relatively long spindle 10 entering the opening of

the core x of the roll of paper. The opposite ends of each spindle are similarly tapered in opposite directions, as at 20, 30, so that relatively long substantially parallel bearing surfaces between the core wall and the spindle are obtained, thereby greatly reducing the likelihood of cracking or breaking down the wall of the opening.

New Colour-Testing Lamp.

Messrs. Lorilleux and Bolton, Ltd., the well-known printing ink firm, have invented a new lamp (patent applied for No. 31,713), which is now manufactured by Messrs. A. W. Penrose and Co., Ltd., for testing the fastness of coloured pigments to sunlight. This lamp, which is known as the "Frequentia," should prove invaluable, not only to printers and printing ink makers, but also to the paint trades and textile manufacturers and all other industries interested in coloured pigments.

The object of Messrs. Lorilleux and Bolton, Ltd., in producing this lamp was to obviate the difficulty of heat radiation, to retain natural atmospheric conditions as nearly as possible, and to evolve constant light. They have obtained this result after extensive experiments in using an arc lamp of very high candle power, enclosed in a cylinder with a dial thermometer. The material to be exposed is fixed in small frames or windows inserted in the cylinder and air-cooled by a fan of variable speed.



An exhibition lamp is now used daily at the premises of Messrs. Lorilleux and Bolton, Ltd., and demonstrations will be gladly given.

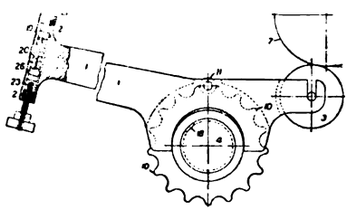
New Inventions

Feeding Sheet.

In an invention by the Cross Paper Feeder Co. sheets are fed to printing and like machines by forwarding devices moving at a constant high speed which is maintained until the front stops are nearly reached, the sheets are then slowed down quickly and released before the stops are reached, the sheets being grasped by their front edge and drawn against the stops. The sheets are separated by known means, such as combing rollers, forwarded by constantly driven rollers 4 coacting with drop rollers 2 mounted in lever arms 10, and are finally fed by rollers 12, 14 driven at the same speed as the rollers 2, 4. The rollers 14 are mounted in resilient arms 48 which can be depressed by cam,



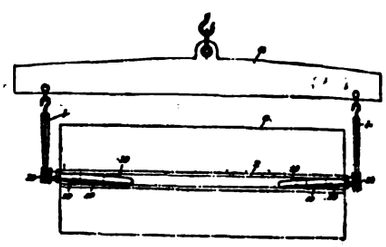
lever-and-link mechanism to release the sheet. There are two rollers 12 symmetrically arranged on a constantly driven shaft 21 provided with hubs about which segment rolls 18 are freely mounted, and oscillated by cam and lever mechanism. The rolls 18 also co-operate with the pressure rolls 14, and are of larger diameters than the rolls 12, so that when the sheets are gripped between the segments 18 and rolls 14, the rolls 12 are out of action. The rolls 18 are given a variable motion and soon decrease the speed of the sheet, until it is nearly at rest. The sheet is then seized by grippers 20 carried by a reciprocating rod 82, and is carried by the grippers against the front stops 16. The grippers are opened to take the sheet by pins 86 on the front stops acting on arms 88 projecting from the upper jaws of the grippers.

Printing Surfaces.

An invention by Mr. A. R. Trist relates to printing surfaces of the kind having ink-repelling areas of mercury or mercury amalgam, and consists in applying gold or other metal having a greater affinity for mercury than the metal of which the printing surface is composed, to prevent diffusion and evaporation of the mercury. A sheet of metal to which mercury will adhere or with which it will amalgamate, or a sheet of material coated with such a metal, is provided with a coating of bichromated fish glue enamel, exposed behind a positive transparency of the required design, and washed with cold water to remove the unaffected parts of the enamel. The remaining parts of the enamel are burnt in, and a layer of iron or other metal to which mercury will not adhere is chemically or electrolytically deposited on the exposed metal. The burnt-in enamel is then removed by caustic alkali, and the metal thereby exposed is treated with mercury with which gold is afterwards associated by applying a solution of a salt of gold. According to the Provisional Specification, a sheet of copper, or of iron coated with copper, is printed with the design in a resist, and a solution of nitrate of mercury applied to the unprinted parts of the surface of the sheet.

Paper Cutting Mechanism.

In an invention by Mr. H. W. V. Wilson and the Victory Kidder Printing Machine Co., Ltd., rotary disk cutters 3 held on levers 1 are pressed against a cylinder 7 by a spring device 2 and are adjusted over the width of the web by wheels 10 threaded for adjustment on a screwed shaft 4. The lever 1 is formed to engage the boss of the wheel, which latter



is locked in adjusted position by a roller 11 carried on the lever. A scale 18 on the shaft facilitates the adjustment. The spring device 2 comprises a cylinder 19 containing two keyed pistons 21, 26, separated by a spring 20, the pressure on the piston 21 being adjusted by a screw 23 with a serrated end. A number of the arms 1 with cutters 3 are mounted on the shaft 4 and their spring devices are engaged by a cam bar extending across the machine. In place of the cutting disks 3 perforating tools may be used.

Moving Rolls of Paper.

In moving heavy rolls of paper by means of a crane, it is customary to insert bars suspended from the crane into the ends of the openings in the paper rolls. Owing to the weight of the rolls and the leverage exerted, these bars frequently mutilate the paper about the openings, or break down the cores. The object of a device by Mr. Howard Parker is to provide bars of such shape that the rolls may be lifted without injury to the paper or the core.

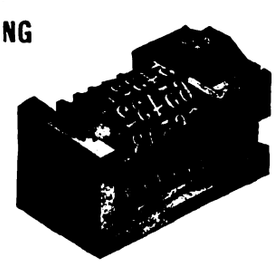
Each of the bars is provided with a relatively long spindle 10 entering the opening of

the core *x* of the roll of paper. The opposite ends of each spindle are similarly tapered in opposite directions, as at 20, 30, so that relatively long substantially parallel bearing surfaces between the core wall and the spindle are obtained, thereby greatly reducing the likelihood of cracking or breaking down the wall of the opening.

New Colour-Testing Lamp.

Messrs. Lorilleux and Bolton, Ltd., the well-known printing ink firm, have invented a new lamp (patent applied for No. 31,713), which is now manufactured by Messrs. A. W. Penrose and Co., Ltd., for testing the fastness of coloured pigments to sunlight. This lamp, which is known as the "Frequentia," should prove invaluable, not only to printers and printing ink makers, but also to the paint trades and textile manufacturers and all other industries interested in coloured pigments.

The object of Messrs. Lorilleux and Bolton, Ltd., in producing this lamp was to obviate the difficulty of heat radiation, to retain natural atmospheric conditions as nearly as possible, and to evolve constant light. They have obtained this result after extensive experiments in using an arc lamp of very high candle power, enclosed in a cylinder with a dial thermometer. The material to be exposed is fixed in small frames or windows inserted in the cylinder and air-cooled by a fan of variable speed.



An exhibition lamp is now used daily at the premises of Messrs. Lorilleux and Bolton, Ltd., and demonstrations will be gladly given.

Burnell, Hardy and Bradly.

A New Force in the Paper Trade.

A new force of some potentiality entered the paper trade of this country as from July 2nd, when Mr. H. G. Bradly, C.B.E., joined in partnership with Mr. Harold H. Hardy under the style of Burnell, Hardy and Bradly, paper mill agents. Perhaps the adjective "new" is not quite correct, because both these gentlemen have for many years been powers in the trade, only they have been acting apart. Now they are joining their exceptional knowledge and experience for the common good.

The firm of Burnell, Hardy and Co., which was established over 30 years ago, had created a high reputation and to this reputation Mr. Hardy, who has been directing the original firm since 1903, has largely contributed. He had previously been a director of Spicer Bros., and during these years he has greatly developed his expert knowledge in all classes of paper and boards. There are few people with such an intimate knowledge of the board side of the industry as is possessed by Mr. Hardy, who has made a special study of the subject.

Mr. Bradly was a director of Lepard and Smiths, Ltd., and in 1916, by reason of his experience, he was appointed technical advisor to the Royal Commission on Paper, acting in the same capacity to the Paper Controllor when he took charge of the department. The remark of a well-known manufacturer voices the universal opinion of Mr. Bradly's regimé: "Mr. Bradly acted with conspicuous ability and fairness without fear or favour in a time of extreme difficulty; always approachable, without red tape or officiousness, sympathetically helping all and sundry with common sense and good judgment." Latterly, of course, Mr. Bradly was a director of Charles Marsden and Sons and some of their associated companies, thus adding "paper manufacture" to his vast experience.

Thus the two partners, who have been acquainted for many years, having had a thorough training in every department of the paper industry, are able to offer to all buyers a service which is something unique. The policy of the old firm will be continued from 106, Queen Victoria-street, where additional accommodation has been secured.

In the main the bulk of the mills for which the firm act produce specialities, which of necessity have to be imported. All the pre-war agencies have been renewed, additions have been made, and in the future there will probably be extensions at home.

With an increased range of paper goods, however, the policy of distributing them through reliable channels will not be disturbed, while more perfect organisation will emanate from the knowledge of what wholesale buyers and exporters require.

Messrs. Burnell, Hardy and Bradly represent not only the Finnish Union of Board Mills, but several other large concerns producing every grade of paper, including "news," printings, writings, wrappings, cover papers, manillas, tissues and copyings, etc.

With the worst of the trade depression over, a joining of the trained knowledge and experience of Mr. Hardy and Mr. Bradly will find plenty of scope. Both have shared in the developments which have taken place in the paper trade during recent years, and they are fully alive to the trend of affairs in the future. Movements are on foot which will mean a still greater use of paper—in the hygienic wrapping of food stuffs, for instance—and in these developments the advice and service which the new firm of Burnell, Hardy and Bradly are able to offer will be of inestimable value.

Scottish Notes.

(From Our Own Correspondent.)

PAPER business is a difficult and irksome problem nowadays. Consumers are very sceptical when one introduces the subject of market conditions. Such is their temper that they are not to be moved in the direction of larger purchases by the argument that prices have an upward tendency. Practically the only answer they vouchsafe to such a proposition is a significant and somewhat irritating smile.

THE influence at work is not so much that buyers doubt the value of the gloomy prognostication. Scarcity of money and intense competition among printers account a great deal for their timidity at the present time. With uncertainty at home and abroad, perhaps the reluctance to enter into commitments is reasonable.

NEVERTHELESS, the tendency of prices is undoubtedly to harden. The higher cost of raw materials is now coming into manufacture, and there is a disposition on the part of papermakers to hold out for a better return for their product.

ON the other hand, consumers are inclined to argue that prices are taking a general trend downwards. They forget such incidents as the Swedish pulp dispute, the strike trouble in Norway, and the larger consumption of pulp and raw materials over a wider area. Or, if they don't forget, at least they are not going to take upon their shoulders more of the burden than they can help.

TO MANY people the mill prices of paper are a puzzle, especially those of wood-free papers. For instance, there is easy bleaching pulp at round about £17 a ton c.i.f. and the selling price of wood-free papers is not higher than 3½d. per lb., and in some cases, 3d. per lb.

IT is common knowledge that in Scotland most firms trading as wholesale stationers hold practically no stock of this class of paper, and, as a matter of fact, are hanging on to the coat-tails of mills carrying stock. These latter mills, on their part, are only able to keep moving by reason of export demand, which has been the saving grace of the paper industry for many months.

THE paper salesman, therefore, is having an anxious if not a lean time at present. There is probably some truth in the belief that the gloomy weather is having its effect upon the trade. It certainly is in other directions of commerce, and the effect is doubtless reflected in paper business. Warm, genial weather might perhaps open the hearts and the pockets of paper buyers and consumers.

SEVERAL of the large London stores have installed machinery for wrapping bread, for which there is a steadily increasing demand.

AN APPRECIATION OF

"SLOGGER"

Automatic Sheet Feeder

(*From letter received by H. T. B., Ltd.*)

"I wish to compliment your Company on the new model 'Slogger' recently fitted to a Quad Demy Two-Revolution Machine.

"During the past week on a 40,000 run the press with the 'Slogger' ran thoroughout at a steady and uniform speed of 1,850 copies per hour in perfect register, and on a test for some hours ran at 2,100 copies per hour, and the only labour required was half an hour's loading up each morning for the day's run.

"The job was an ordinary Magazine, Demy 8vo., 32 pp., machine set type, and the paper Quad Demy, mill finish, 76lb.

"It is only since the 'Slogger' was fitted that I have been enabled to obtain the full productive capacity of a Two-Revolution Machine, and I do not exaggerate when I state that on longish runs of Quad Demy size sheets the output is fully 50 per cent. above that of hand feeding with better register. On very thin paper, and also on larger size sheets the output percentage would be much higher.

"I am convinced that for speed, reliability, accuracy, and labour saving there is no Automatic Feeder on the Market at present to equal the 'Slogger' for Magazine and Book work, both for long and short runs."

YOU WILL HAVE SIMILAR RESULTS WHEN YOU INSTALL "SLOGGER" PILE FEEDER.

THE BRITISH & COLONIAL PRINTER AND STATIONER

FOUNDED 1878. PUBLISHED WEEKLY.

WITH MONTHLY SECTION FOR THE BOOKBINDER.

The Recognised Organ for Printers, Printers' Engineers, Wholesale and Manufacturing Stationers, and Makers of Machinery and Appliances for the Paper Bag, Envelope, Box-making, Bookbinding and all Paper and Board Consuming Industries.

VOLUME 93. NUMBER 2. [*REGISTERED AS A NEWSPAPER.*] LONDON: JULY 12, 1923. EVERY THURSDAY. PRICE TWOPENCE.

Peculiarities and Pitfalls of the Craft.

Mr. E. H. Atkinson talks to Master Printers from the Blockmaker's Point of View.

Frankly I don't like that word "pitfalls." If craft means *printing craft*, it almost looks as though blockmaking is one of the pits the craft falls into, and I have been invited here by the judge (Mr. Cole), with you as jury, to answer for the supposed sins of the crafty process man.

Do you agree that once a printer always a printer? If so, I will claim companionship. I spent eight years of my callow youth in printing. My father was a printer, my grandfather also, who in his youth, long before the time of railways, tramped the long road from the north to London, worked at his craft, and, returning to his distant native town, succeeded in gathering together a modest competence. But I fancy only a comparatively smaller portion was made by printing and its allied trades. And this rouses the thought: How few wealthy men have gained their wealth by printing or fewer still by blockmaking and is there any reason why printing or blockmaking should not provide profits? Is there any reason why other trades should be profitable and not printing?

I am glad to note that your Federation is making the effort to improve the status of the craft. It does not seem sensible that the craft that is the most important to civilisation should be starved of the means to progress.

Advantages for the Printer.

But to return to the pitfalls. How few realise now—if they indeed have had experience of the days before process—the advantages process engraving has placed at the service of the letterpress printer? In my young days, and before we published many books, some of quite important size, they were illustrated, but all those illustrations had to be done out of the firm, either by lithography or by the Woodbury process, and I believe I was the first in that remote district to use either line blocks (or later) half-tone blocks for illustration purposes; and though they cost 1s. 6d. per inch for line and 2s. 6d. per inch for half-tone on zinc, and were very screeny at that, they were, even at that early day, a big improvement in convenience and accuracy in illustration and placed a power in the hands of the letterpress printer which at that time he did not possess at all.

The coming of half-tone gave cheaper illustrating with the added advantage that they were photographic and therefore more accurate. Another very considerable advantage accrued to us, in that we were able to print the illustrations in our own office instead of, as hitherto, sending the work to be lithoed. I wish to stress this latter point very strongly. The process engraver has been and is of the greatest importance to the modern letterpress craft, and what he has done for letterpress the last 35 years is apt to be forgotten, or, perhaps, in the case of the younger generation, never realised by them at all.

Address given at meeting of South-West London Master Printers' Association.

An Elaborate Process.

Of the troubles (or pitfalls) of the process engraver I take it you are not particularly interested and of descriptions of the methods I expect you are surfeited; but for the purpose of showing you what a large amount of detail work goes into the making of a one-colour half-tone block, I may say that it goes through seven or eight sets of hands.

First, then, the office—and most frequently each half-tone block has something different from every other one—where the instructions are carefully read, and, if not clear in any particular, queried with the customer. Entered and sent to the artist's room for spotting retouching or alteration or addition, then to the studio, where a glass negative is made through a lined glass screen, ruled with the requisite degree of fineness or coarseness required.

This negative is for technical reasons usually made by wet plate process — that is, a plain glass is coated by hand with collodion (a solution of gun cotton or pyroxyline in ether) and the coated plate bathed in silver nitrate and exposed in the camera whilst wet. This exposure, if the block is to be first class, must be just right in regard to length of time, and varies within narrow limits according to the size and colour of the original photograph. There is, therefore, possibility of even highly experienced men not judging the exposure correctly the first time and he may have to expose a second negative, varying the time in accordance with the first trial.

When correct, this negative goes to the printer on metal, who coats a piece of copper of the requisite size with a solution of fish glue and bichromate of potash, dries it, places the coated plate in contact with the negative in a heavy pressure frame with an inch plate glass front and exposes this to a powerful arc fight. This time of exposure has also to be correct. The plate is taken out and washed and where the light has acted the glue remains, but where the negative has protected the glue film from the light, it is washed clear, leaving bare copper. The copper plate then goes to the etching-room, where it is placed in an etching machine which sprays a solution of iron perchloride at it; this acid eats away the bare copper, leaving the glue-protected parts or dots in relief. A hand press prover takes a rough proof and returns the plate and proof to the fine etcher

The Quality of Half-Tone.

Now the brightness and sparkle of a half-tone block depends largely on the size of the dot. Obviously a large dot prints darker than a small one and the first etching very probably leaves the dots too big in the light parts of the picture; yet if they were etched further without stopping the shadows, the shadows would also etch lighter and a gray flat picture result: so it is the duty of the fine etcher to paint out with an acid-resist those parts which are sufficiently etched and re-etch those parts which would be better if lighter: this is hand work and needs some considerable skill to do with judgment and artistic success.

From him the plate, after a further proof to see that it is right, is sent to the router who cuts away the waste edge, either by bevelling or by routing with a fast revolving steel cutter; then to the engraver to hand finish the edges, etc. A finished proof is then taken, the plate mounted, and sent home.

All this as I have said is for the purpose of making clear to you the amount of detail work involved in the making of a block. Now I want you to accept another statement, and that is that, in all good products and especially those to which "mass production" cannot apply, yet even to those also in a less degree, the quality of the product depends on the throwing out of less than standard and doing any operation over again correctly as the job is in progress.

Therefore, I ask you to give enough time on the preparation of the blocks if you want the best results when you come to print.

Another thing I ask of you is definite and clear instructions; and perhaps the most common pitfall the engraver has to endeavour to skip *is that of size*. Many customers don't give any size at all. Possibly it may be because they want the photographs reproduced same size; but on the other hand, it may have been an oversight. The engraver cannot tell without asking.

Give the size required in inches, the narrow way or the long way, or both.

Question of Screen.

The screen can safely be left to the engraver if you tell him the purpose. My advice is to use the coarse if possible. For instance, of 175 and 150 for art paper, I would always use 150, and even then on a fairly large or large detailed subject would prefer 133. There are 22,500 dots in a square inch of 150 screen half-tone and if one dot is missing it can be de-

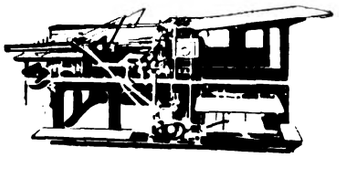
Economise by Installing



The Miehle

WHEN next you are in the market for letter-press printing machinery, fully consider the Miehle.

It may be a long time before you are again in a position to bring your press equipment up to date.

And when considering the Miehle, make a special note of the rapidity with which any job can be made ready for printing. In some cases this feature alone makes the Miehle worth two ordinary presses in actual production, but it does not cost the price of two.

Let us tell you how to economise by installing a Miehle.

tected with the naked eye. So we have a few million dots to look after in the process engraving business.

The finer the screen the more dots there are to the sq. in.; but no matter how fine the screen, each single dot can only be etched to a certain smallness. That is the 133 dot can be etched just as small in itself as the 150 or 175 or 200. Therefore, in a sky or high light the 17,689 dots in a sq. in. of 133 screen obscure less white paper than the 22,500 dots in a sq. in. of 150 screen. Therefore, the 133 screen gives you a brighter picture than the 150 screen, and is also easier to print as it is deeper.

This reasoning applies to still coarser screen, but other factors also apply, one being that below 133 the coarseness of the screen becomes unpleasantly noticeable to the eye, and the smaller details of the picture are cut up by the course screen and lost.

So to sum up I recommend you to use as coarse a screen as the job will stand in view of (1) paper to be used (2) speed at which you want to print, and (3) also to some extent the smallness or largeness of the detail of the picture.

In regard to instructions generally: I expect you have seen that little book, "Printing Gets Things Done," published by the Hammermill people. Boiled down, the gist of the argument is that, having a printed form (instead of odd pieces of paper or an old envelope back) and putting your instructions in writing not only clears your own ideas and makes them definite, but also ensures that the one who receives the written instruction in a neat systematic form does not forget or overlook, and you get your wants done smoothly and according to plan.

I believe it is quite sound reasoning. Anyway, like most systems, it brings grist to the printer for the forms. For they are applicable to any kind of business.

Suitability of Copy.

In many cases you are helpless; that is, you have just to use what the customer brings; but start right if by any means you can. Be chary of accepting for reproduction photographs, etc., with which your customer is already dissatisfied, for it is extremely likely that his dislike will be continued to the reproduction. Although the engraver can generally improve matters, yet these improvements are costly, and a little trouble taken in getting a new photograph, if this is at all possible, is by far the more satisfactory for all concerned; it makes sure of pleasing the customer and costs less.

The best prints for reproduction are those known as glossy bromide prints. This kind brings up all the detail there is, and, being grey, that is, in tones of black, copy well and also give a fair comparison when your customer sees his proof, which is also in black. Sometimes a reddish or sepia or other brown-toned photograph is supplied, and the proof being *in black* shows somewhat unfavourably in comparison with the more pleasing colour of the original. These brown-toned photographs if at all reddish or yellowish take longer to expose in copying and require more handwork to reproduce well.

Line Work Copies.

Reproductions from most kinds of copies can be made nowadays, even manuscript letters written in blue black ink. One dodge we use is to hold them in the fumes of ammonia which turns the ink black if there is sufficient ink in the paper; but they and also purple typewriting can be copied with colour filters and a line block got that way.

Ordinary pen and ink drawings should be drawn in quite black ink, a fixed ink preferably, and care should be taken that the light lines are fine but black; not thickish and grey, which is much the same to look at with the eye only; but as, in line work, we can only deal with *black or white*, these *grey* lines either photograph into thick black ones, which spoils the effect of the reproduction, or, if the grey is a very light grey, they won't photograph at all, as they are so nearly the same value as the paper on which they are drawn.

In this regard it is convenient to have a pocket magnifier which enables you to see the effect I mean. It is also useful to examine art paper, and if it is powerful enough you will be astounded to see the pits, miniature Etnas, there are even on the best arts. In buying art papers there is nothing so good as a proof on the papers from the same block with the same ink as a test of their respective suitabilities for half-tone work, but the pocket magnifier is quite a help also.

In the earlier days of process a very general complaint of half-tone blocks was "its shallow"; but one does not hear that complaint nowadays, probably because most engravers give all plates their full deepening bath in the machine so that depth is always as ample as the screen used will permit.

Wood mounts are another pitfall that is always with us. It will be as great a day for the engraver as for the printer when a material comes along that will be as light as wood, as easily worked, and as reasonable in price yet will stay flat. Probably the plywood mounts are as good as anything yet, but they will come apart if the blocks are washed with lye. One printer who had been doing so with a small block sent us the pieces back and reproached us severely for mounting our blocks on riglets. Until the perfect material comes along all we can do is use every care in selecting the wood and store it as long as possible indoors, so as to send it out thoroughly seasoned. Should you then have occasional trouble from warp, get the engraver to remount them for you.

Growing Use of Illustration.

Earlier in my paper I stressed the value of the engravers product to you as letterpress printers; but you may say, "we don't care much for the trouble of buying them and the cash profit is insufficient." Indirectly, however, I believe that more and more printing will be illustrated printing and probably you will agree that most jobs with long runs are illustrated jobs. Certainly for advertising and catalogue work blocks are essential and I have no hesitation in saying that you will be increasing your turnover by cultivating illustrated work.

Now probably the best way to cultivate illustrated work is to specialise on one particular kind or trade. We most of us have some hobby or study apart from our business, and that hobby or study we are likely to be expert in or at anyrate know a lot about, which knowledge can be readily added to. A printer who knows the details of that hobby or study or trade obviously can do the printing requirements of that hobby, study or trade better than a printer who has not that knowledge. I think specialisation in this way is the trend of present-day printing.

Well, gentlemen, that is all; I have left out much. I have not touched on colour, for instance, on which I could say a good deal, and no doubt many other engraving matters will occur to you. I have endeavoured to convey to you that the engraver values your help. He and you are inseparably connected and mutual goodwill smooths out the difficulties in both crafts.

Australian Preference.

It seems that exporters of British paper to Australia are not taking full advantage of the measure of preference which has been granted to them by the Australian Government. Under Section 9 of the Australian Industries Preservation Act, a duty is leviable upon foreign paper representing the difference between the fair market value in the United Kingdom and the export price of the foreign goods concerned, but in order that this might be made effective it is necessary for exporters of paper to Australia to make out a case to the Australian Minister of Trade and Commerce. Apparently British exporters have not done this. With trade at a low ebb and even exporters complaining, it is obviously unwise to neglect a helpful provision such as the Australians have put in our way. Perhaps it only requires attention to be drawn to this fact to induce British exporters to take the necessary action.

AN improvement in esparto paper prices is noted, the increase all round being about ½d. Apparently there is little difficulty in getting the higher figures.

CHAS. MORGAN AND CO., LTD.—A varied selection of papers and boards is offered by Chas. Morgan and Co., Ltd. English writings are available in nine art shades and tinted banks in eight. A new series of linen-faced bond papers is issued in cream azure and ivorine tints. There are also some attractive boards, etc. An advantage of the Charles Morgan service is that stocks are available not only in London, but in Leeds, Glasgow and Manchester warehouses.

Paper Trade Golfing Society.

Summer Meeting.

Some excellent scores were returned at the Summer Meeting of the Paper Trade Golfing Society, which was held at Temple Golf Club, Maidenhead, on Saturday, June 30th, the following members taking part in the competitions:—Major F. H. Bowater, Captain Noël V. Bowater, G. Buchanan, J. E. Harmer Dalton, W. A. Dewsnap, O. Dixon, Major A. J. Evans, E. B. Fiske, R. G. Harvey Greenham, B. J. Hall, C. E. Higgins, R. Hubble, D. Hayden Kentish, E. C. Lait, N. H. Leander, J. Macnaughton, W. V. Marchant, K. S. Mason, A. J. Mitchell, Captain C. R. Mullings, E. H. Raynham, G. C. Robertson, J. Seddon, G. W. Shilcock, F. A. Skerratt, A. Dykes Spicer, R. J. Triggs, Major H. S. Wescott, E. Lewis Winn, J. Woodhouse.

In the Stroke Competition, which took place in the morning for the President's Cup, Major H. S. Wescott was successful with a score of 68 net, Mr. N. H. Leander being the runner-up with a score of 69 net, and Mr. George Buchanan third with a net score of 71; the next best scores being:—Captain Noël V. Bowater (74 net), Captain C. R. Mullings (74 net), Mr. W. A. Dewsnap (75 net). Major H. S. Wescott therefore becomes the holder of the President's Cup for the current year.

The Summer Foursomes Competition against bogey for Society spoons was held in the afternoon, Major A. J. Evans and Major H. S. Wescott being the winners with a score of 2 down. Mr. C. E. Higgins and Mr. W. A. Dewsnap were second with a score of 3 down; Mr. F. A. Skerratt and Mr. G. Buchanan being 4 down.

The following members qualified at this meeting to enter the competition for the "Spicer Challenge Cup" to be competed for annually under match play conditions:—N. H. Leander (69 net), Captain Noël V. Bowater (74 net), W. A. Dewsnap (75 net), Major A. J. Evans (76 net), E. C. Lait (76 net), D. H. Kentish (76 net), J. Woodhouse (76 net). J. Seddon and E. B. Fiske tied for 8th place with 77 net.

In addition to providing an excellent day's golf, the meeting was of a thoroughly enjoyable nature, and its great success was much enhanced by the delightful weather with which it was favoured.

Wedding of Miss Hilda Raynham.

At All Souls Church, Langham-place, W., on July 4th, Hilda, the elder daughter of Mr. E. H. Raynham, the managing director of Edward Lloyd, Ltd., was married to Mr. Frederick Lyne Pascoe, the service being conducted by the Rev. Henry Must, Vicar of St. David's, Barnsbury.

A reception was held after the ceremony at the Langham Hotel, where the many beautiful presents were on view.

About 150 guests attended, amongst whom the following are well known in the allied trade: Mr. Frank Lloyd, Lt.-Col. and Mrs. John R. Garwood, the Rt. Hon. Lord Dalziel of Kirkaldy, Sir Howard and Lady Spicer, Mr. Dykes Spicer, Mr. and Mrs. Stanley Cousins, Mr. E. S. Lendrum, Mr. and Mrs. Edgar Fifoot, Mr. and Mrs. Denis Odhams, Mr., Mrs. and Miss Jeremiah, Mr. and Mrs. J. S. Elias, Mr. and Mrs. Percy Denson, Mr. and Mrs. R. B. Miller, Mr. Herbert Clarke, Mr. and Mrs. Gerald Denson, Mr. and Mrs. Johnston Smith, Mr. and Mrs. L. G. Gooding, Mr. and Mrs. Featherstone, Mr. and Mrs. William Whyte, and others.

The happy couple left amid the hearty good wishes and congratulations of all for the honeymoon, which will be spent in Paris and Switzerland.

ST. CUTHBERTS PAPER WORKS, LTD.—Messrs. Pirie, Wyatt and Co., Ltd., inform us that as their firm has been known in the United Kingdom and abroad for many years past as "St. Cuthbert's Paper Works," although the title of the firm has been "Pirie, Wyatt and Co., Ltd.," they have now decided to change the name to St. Cuthbert's Paper Works, Ltd., as from July 1st. There is no change whatever in the firm itself, or in the management of the business.

Gold Inks

(LETTERPRESS)

IF you have never yet tried Gold (Letterpress) Inks or are familiar only with those hitherto obtainable, Lorilleux and Bolton's gold inks will be a revelation to you.

No modern printer keen on cutting costs and speeding up production can possibly afford to ignore the handiness and economy they offer.

The following points show the great superiority of Lorilleux & Bolton's gold inks:—

1. They do not clog or harden on the rollers.
2. Need no specially skilled operator.
3. Are suitable for either platen or cylinder machines.
4. The machines can be run at normal speed.
5. Retain their brilliance for long periods.
6. Print the type thoroughly and heavy solids without difficulty.

Available in light and dark shades of gold as well as silver.

Write for specimen prints and generous sample tin to-day.

LORILLEUX & BOLTON LTD.

THE FUTURE OF SOUTH AFRICA

THE strong development and progress shown by South Africa, even during the depression of 1922, indicates in no uncertain fashion the measure of prosperity that country will enjoy in more normal times.

The trade outlook for the Union of South Africa in 1923 is extremely encouraging at the present moment, and the attitude of all in that wonderful country—from the Premier (The Hon. Gen. Smuts) down to the smallest Printer—is one of well-founded optimism.

Supply houses catering to the Allied Trades anxious to develop the South African market will be sent a post-free copy of

THE SOUTH AFRICAN PRINTER AND STATIONER

the only Journal printed in South Africa catering to the Printing Trade. Issued monthly.

Trade Notes.

WE understand that the first meeting of the Government Committee to inquire into the State Printing Works has been held this week. Evidence will be takenfrom next Wednesday. It has been decided to sit in private until the report stage, which will not be reached for some time.

ACCOUNTS and balance-sheets relating to the trading of Government Departments for the period ended March 31st, 1922, show a loss on the Harrow Printing Works of £21,093.

THE council meeting of the London Master Printers' Association, which is due to be held to-day (Thursday), will discuss a number of important matters relating to the organisation. The Association has issued a new prospectus tracing its history and giving an outline of the valuable work which has been and is still being undertaken.

AMONG those who were killed in the regrettable train disaster near Diggle, Yorks, last week, were Mr. and Mrs. J. H. Keyser. Mr. Keyser was a representative of Messrs. Ford, Shapland and Co., Ltd., printers and lithographers, High Holborn, London.

THE Leicester Chamber of Commerce report that the printing trade maintains a slight improvement, and the tone all round is more hopeful, but competition is becoming keener.

ESTABLISHED on July 8th, 1723, the *Reading Mercury and Oxford Gazette* last week-end celebrated its bicentenary, and in connection with the event the proprietors issued an historical supplement. With the supplement there is a facsimile reproduction of "Vol. I, Numb. I" of the *Reading Mercury or Weekly Entertainer*, as the paper was then called. It was to be continued weekly at the price of 1½d. The supplement and facsimile are well produced.

THE summer meeting of the Kent district of the Institute of Journalists at Folkestone was a very enjoyable and successful function. Mr. A. J. Crowhurst, the chairman of the district, presided.

A BOWLING competition organised by the East Anglian Alliance is to be held on Saturday at Ipswich. Mr. H. Hanson, as the new president, is offering a cup, and Mr. A. E. Goodwin and Mr. A. E. Holmes are to attend.

THE North-Eastern Alliance of Master Printers is to hold a special summer outing on the 19th inst. at Hexham.

THE employees of Messrs. Ernest Davies and Co. (1919), Ltd., printers and stationers, Swansea, held their annual outing at Weston-super-Mare.

THE Glasgow Printers' Rowing Club held its confined regattas on the last two Saturdays on the upper reaches of the Clyde. Crews from prominent printeries in the district took part.

ON the invitation of Mr. J. W. Hindson senior partner of the firm of Messrs. J. W Hindson, printers and stationers, Newcastle-on-Tyne, the employees had an outing to Ponteland on Saturday afternoon. A programme of sports was carried out.

ANOTHER excellent piece of printing comes from the London School of Printing and Kindred Trades and represents the stationer's craft lectures which have been arranged by the Stationers' Company and Printing Industry Technical Board, and which were held at the Stationers' Hall during the session 1922-23. Embellished with a coloured portrait of Mr. Herbert Fitch, the master of the Company, the lectures themselves cover a wide range and are of very great interest to the printing industry. Their value, however, is enhanced by various diagrams and tables, all of which are the work of the Printing School. This practical illustration of the excellent work which is being done by the London School of Printing speaks for itself.

A SETTLEMENT was announced of the two libel actions brought by Mr. Winston Churchill against the Associated Newspapers Ltd. and the Victoria House Printing Co., Ltd., with regard to allegations made in the *Evening News* and *Daily Herald* relating to an official mission which Mr. Churchill paid to Egypt when Secretary of State for the Colonies. All imputations were unreservedly withdrawn, and defendants apologised for having made them.

MR. ARTHUR WADHAM, founder and editor of the *Machinery Market*, has died in a nursing home in Carlisle, aged 71.

A CORRESPONDENT in *The Times* says he has just received a circular from Holland advertising bulbs, which has been posted in Austria. The Postmaster-General's new Bill, he adds, fails entirely to touch an issue of this kind, and illustrates the unfairness of the Bill as proposed.

THE *Pillar Box* is the title of a new monthly shilling magazine, published under the editorship of Mr. George Middleton, M.P., the contents of which are entirely written by members of the Union of Post Office Workers.

MR. W. ROE, for many years acting editor of the *Eastern Morning News*, Hull, died suddenly on Monday night while writing a leading article.

MR. A. EDMUND SPENDER, editor of the *Shrewsbury Chronicle*, died in a Shrewsbury nursing home early on Friday morning, following an operation for appendicitis. Mr. Spender was a well-known journalist and was appointed a member of the committee of management of the Press Association in 1914, and elected chairman in 1917. In 1919 he passed by rotation to the Consultative Board of the Association, of which he was still a member at the time of his death. Mr. Spender was formerly on the editorial staff of the *Western Morning News*, Plymouth, a newspaper founded by his father. He was a cousin of Mr. E. Harold Spender and Mr. J. A. Spender.

IN introducing the fourth of the series, "Coats of Many Colours," that is "The Lady in the Green Cloak," Messrs. Coates Bros. and Co., Ltd., point out that quality inks are not necessarily high-priced inks. This is a case in point, the coat having been produced with their satin green lake letterpress ink at 4s. 6d. per lb., a very clean, attractive colour, and a useful ink for the quality printer to have in stock.

SMITHS' PRINTING CO., LTD., 22 to 24, Fetter-lane, E.C.4, although claiming not to be infallible, assert that they know what the printer actually wants. To this end the firm direct our attention to a comprehensive list of lino and mono faces they have ready suitable for all kinds of printing.

THE late Mr. Philip Alexander Rodyk Knight (54), of Cromwell-mansions, Kensington, journalist, left £15,024.

COLONEL LAWSON, of the *Daily Telegraph*' who has just returned from attending the advertising convention in America, took the opportunity of paying a visit to the Chicoutimi Pulp Mills in Canada.

CONSUL T. T. SCHJELDERUP, of the Jarlsberg Paper Mills, Gulskogen, Norway, is on a visit to London, and reports satisfactory business.

MR. HAROLD H. HARDY and Mr. H. G. Bradly, C.B.E., have received a very large number of letters of congratulation on their new venture, widespread interest being evinced.

MR. W. MONKHOUSE, the president, and other members of the council of the Drawing Office Materials Manufacturers and Dealers' Association, at the invitation of Messrs. Wiggins, Teape and Co., recently paid a visit to the Glory Mill at Wooburn, to inspect the manufacture of photographic paper.

MR. RICHARD COOPER, cashier at the Orchard Mill branch of the Wall-paper Manufacturers, Ltd., Darwen, was married last week at Darwen to Miss Florence M. Muir.

THE virtues of paper bag cookery are commented upon by a writer on domestic economy.

MESSRS. F. A. MARSDEN (formerly Anglo-Norse Paper Agencies, Ltd), 56, Ludgate-hill, London, E.C.4, has been appointed sole agent in the United Kingdom for Albion Paper Mills, Mjondalen, Norway (Anth. B. Nilsen and Co.), makers of wood tissue, sulphite tissue and acid free tissue and thin printings. The agency came into force on July 1st.

MEMBERS of the Bowling Section of the Stationers' Social Society spent a very pleasant evening on Wednesday, June 17th, at the Walthamstow grounds of Messrs. Waterlow's. The visitors were agreeably entertained, tea being served before the match took place. Play was of a very keen and interesting character, the visitors winning one rink and the home team the other. The total scores showed a difference of two points in favour of the Stationers. Mr. H. J. Burholt and Mr. A. Ling were the skips for the visitors.

Trade Union Matters.

WE learn that as a result of negotiations held on Monday at the Charterhouse Schools between Messrs. De La Rue and the executive of the London Printing and Kindred Trades Federation relating to the paper workers' strike at that firm, a ballot is being taken by those affected on the suggestions put forward by the employers.

A QUESTION OF OVERTIME CHARGES.—A printing firm at Harpenden have recently commenced a two-shift per day system, the first from 6 a.m. to 2.30 p.m., and the second 3.30 p.m. to 1 a.m. Negotiations with the Typographical Association as to the charges to be made for overtime have resulted in an agreement that overtime rates be paid for all hours outside the scheduled day hours of the branch.

NEWSPAPER WORKERS AND A SEPARATE SECTION.—Mr. F. Dunn, the National "Father" of the News and Operators' Guild, writing in the official circular of the Guild on the question of forming a separate section of the Typographical Association for newspaper workers, says that while the dominating note of the Guild is one of unfailing loyalty to the T.A., and one of complete confidence in the sense of justice of the jobbers and machinemen, it is urged that on all matters affecting news workers only their special representatives and the newspaper proprietors can have a complete understanding of the strenuous work appertaining to present-day daily newspaper production. He adds that the profits of the newspaper industry to-day are capable of a much more substantial wage bill than the present conditions carry.

THE executive of the N.A.T.S.O.P.A. have considered the question of the appointment of an organiser especially charged to deal with the Clerical Section of that organisation. At a recent meeting it was decided by 10 votes to 4 that the time had arrived for the appointment of an organiser to deal especially and exclusively with the work of organising clerical workers. The recommendation is to be placed before the governing body of the N.A.T.S.O.P.A.

CONFERENCE FOR NEWS WORKERS.—The National News and Operators' Guild, which embraces the newspaper workers of the Typographical Association, have arranged a conference with representatives of the Newspaper Society, for July 17th in London. The outstanding features of the Guild proposals are a 44-hour week for day workers and 40 for night workers (a wage rate basis 25 per cent. above the corresponding rates for night work), a half-day off per week for members on evening papers and a night off per fortnight for members on morning papers, without loss of pay.

The Joint Industrial Council.

A meeting of the Joint Industrial Council of the Printing Industry was held on Wednesday, and as the first business on the agenda, General Bemrose was unanimously appointed chairman.

The annual report for the year, which was adopted, showed that useful work had been done by the Organisation Committee, the Conciliation Committee and the Health Committee in particular. Discussion took place on the Organisation Committee's report, showing that some difficulty had arisen in Scotland, which, it was hoped, would soon be removed.

An interesting booklet, which is to be widely circulated and entitled "The Great Opportunity," was distributed.

It is gratifying to learn that in the Lancashire and Cheshire area steps are now being taken to organise district committees.

The Health Committee reported that they are hoping that experiments conducted by the British Ink manufacturers will be successful in producing a substitute for bronze in the lithographic section of the industry. It was intimated that in the letterpress section the substitute was working very satisfactorily.

THE whole of the awards in Tuck's Post Cards' Postage Prize Competition have now been made, and cheques and prizes posted to all prize-winners.

London Society of Compositors.

Celebration of the 75th Anniversary at the Crystal Palace.

The Jubilee Celebrations of the London Society of Compositors, held at the Crystal Palace on Saturday, constitute another important epoch in the history of this important organisation. The afternoon's proceedings, carried out in typical summer weather, were taken up with enthusiasm by a large gathering. From the field sports in the early part of the afternoon to the dancing which lasted until 10 o'clock at night, there was at all times prevalent an atmosphere of good fellowship.

The field sports were not only well attended by many members of the rank and file of the trade, but by several representatives whose names figure prominently in other branches of the industry. Among those present at this stage of the proceedings were: Messrs. C. W. Bowerman, M.P.; T. E. Naylor; T. Timberlake; C. J. Drummond, M.B.E.: S. W. Newcombe; D. Pointing; F. A. Davies; A. E. Holmes; W. Vandy; J. Beck; W. H. Christopher; H. F. Parker; A. G. Wills; G. Isaacs; and W. Stevens. Two interesting visitors were Mr. S. Marks and Mr. McHugh, Vice-Presidents of the Pressmen's and Assistants' Union of North America, who had come straight from Southampton in order to be present.

Field Events—Results.

Notwithstanding a thermometer showing of close upon 130 degrees in the sun, some very excellent sporting events were witnessed. The following are the principal results :—

TUG-OF-WAR. — Victoria House, 1; Odham's Press, 2.

100 YARDS HANDICAP.—H. C. Dowie (H.M.S.O.), won 3 yds. 10 3-10th sec.

880 YARDS HANDICAP.—A. H. Carter (St. Luke's P. Works), 8 yds. 2 min. 13 1-5th sec.

80 YARDS VETERANS' HANDICAP.—E. Gordon (Belgrave H.), 1; A. J. Robinson (Unattached), 2; W. H. Chegwidden (E.C. & C.), 3. 9 3-10th sec.

ONE LAP (QUARTER MILE) LADIES' WALK.—Miss Naylor, 2 min. 19 2-5th sec.

ONE MILE HANDICAP.—T. F. Goodman (Elstree A.C.), 1; C. Street (Unattached), 2; H. J. Messer (Wigmore H.), 3. 4 min. 58.5 sec.

300 YARDS HANDICAP.—A. Tyler (St. Luke's), 1; H. H. Prestidge (Avenue Press A.C.), 2; W. Burge (St. Luke's), 3. 33 2-5th sec.

MILE RELAY RACE.—H.M.S.O., Harrow (T. Goodman, A. Dowie, T. Dunn, E. Pitt).

The Re-Union Meeting.

Soon after five o'clock a large gathering assembled in the spacious theatre inside the Palace buildings. Many inspiring addresses were delivered, the prevailing note of the speeches being expressive of deep gratitude, not only to those whose names now only live in the memory, but to those who are still in the forefront of the Society's activities. The audience, too—which consisted of many veteran "typos" whose memories take them back to the early struggles of the Society—was quickly responsive to any reference to what the Society had done during its seventy-five years of existence, and also to what it might accomplish in the future.

Mr. T. Timberlake, who opened the proceedings, referred to the celebrations that day as marking a great event in the history of the London Society of Compositors. They had several members there, he said, who, though not at the inception of the Society, had very vivid recollection of those old stalwarts who started the organisation. When one thought of the efforts of the founders one was bound to express admiration for the stamina in the hearts of those men. He thought they to-day should follow in their footsteps, and be determined to uphold the spirit that permeated the minds of their old friends in days gone by. This was their seventy-fifth anniversary, and it would not be so very long when they would celebrate their centenary; he hoped to live to see that day. (Cheers.)

Mr. Robert Dent, who spoke as one of the oldest members, having joined the Society 60 years ago, remembered the time when Mr. Self was the secretary, whom, he thought, had not been beaten in the office. Mr. Self was a diplomat, and a man who knew what to do and the way to do it. The speaker's own memory went back to the time when he was an apprentice and the journeyman compositor worked for 66 hours at 22s. a week. When they compared the wages and hours prevailing then with what they were to-day, they could realise what the promoters of the Society had to contend against in order to secure the great concessions they now enjoyed.

Scenes on the Ground: 1. Mr. Drummond and Mr. Naylor watching the Events; 2. Mr. H. F. Parker; 3. Three Familiar Figures and two American Friends.

Mr. Naylor's Speech.

Mr. T. E. Naylor (General Secretary) said he was delighted to hear Mr. Dent, because the first year after he came out of his time he (Mr Dent) was always in his mind as one of the most prominent speakers the Society had. They were there that day to celebrate their seventy-fifth anniversary—to reflect upon the past and to look forward to the future. They were proud of the past achievements, and they hoped also to be proud of events that are yet to take place. Looking round at the present moment, continued Mr. Naylor, no member had cause to be ashamed of the position the Society occupied to-day. They would agree with him that under the leadership of other men in the past, it has been recognised in the trade union movement that the L.S.C. was always expected to be found in the forefront. The reason for this was to be found in the fact that they had such men as Mr. Drummond and Mr. Bowerman, who had held the responsible position of secretary for many years, and whose records are looked upon with thankfulness. During the past seventy-five years, as the Chairman pointed out, there had been some remarkable changes. In the year 1848, when the Society was founded, the total income was not more than £1,000. To-day, the yearly income easily reached £100,000. From a membership of 1,500 to 1,600 they had grown to 15,000. With regard to benefits in those early days, unemployment benefit was about 6s. per week, funeral benefit possibly did not amount to more than £10, superannuation did not start until 1872, and was then up to 8s. a week. Now, the sum paid for unemployment was 36s. a week, that for funeral benefit was £25, and, as the result of a ballot quite recently taken of the members, when a man reaches the age of 60 and feels his tide of life is flowing out, the L.S.C. provide him with an income of £2 a week to enable him to take a rest.

The Need of Sacrifice.

However, all these things, proceeded Mr. Naylor, were not done without sacrifice, and the sacrifice was being made by their members. One of the greatest tests of loyalty a man could show to an organisation such as theirs was for him to pay for benefits that possibly he might never enjoy. That occasion was not his show, however; the stars of the programme that night were Mr. Drummond, Mr. Vandy, and Mr. Dent. They were the men who represent what had taken place during the past seventy-five years.

Mr. Bowerman, referring to Mr. Naylor's allusion to men over sixty as being in their declining years, said he would like to mention one or two of them. There was Charlie Drummond, who had turned sixty long ago, and no one would say he was declining. Then there was "Young Vandy," who was nearer eighty than sixty. Again, there was treasurer Jones, who, he believed, had reached his eighty-second year. There was a secret that kept these men young, and that was to be found in the fact that they had held cards ever since it was possible for them to do so. (Applause.) After all, when one looked back on what the L.S.C. had done in taking the lead in trades union movements, and in creating a high standard so far as membership was concerned, they were delighted, whether below sixty or over it, to participate in the glorious function being held that day. Referring to their

Digitized by Google

15,000 members, Mr. Bowerman dwelt on the fact that the huge sums of money coming into the Society came not from the pockets of the employers; every farthing was provided by the workmen themselves. When the record of the Society was written—and he hoped by his literary friend, Mr. Naylor—he was sure they would feel proud to have been members of the London Society of Compositors. Finally, he wished God-speed to the work.

Mr. C. J. Drummond, a former secretary, after referring to the Ipswich branch of the Typographical Association, which he founded and of which he was still a member, went on to speak of the introduction of the Linotype machine in this country. No industry ever had such a revolution in its ranks as was caused by the introduction of typesetting machinery.

Mr. Vandy spoke of men well-known in the Society's history, and referred to them as the pioneers, the foundation-makers, of the Society. They sowed the seed, and to-day we reap the benefit. Splendid men they were. They fought a good fight. "Ne'er shall their memory fade." He was going to take that favourable opportunity of naming three of the great men of the Society—Mr. Drummond, Mr. Bowerman, and Mr. Naylor. (Cheers.) They are giants of men, and they did not know what they owed them. At that festival they thought of the worth of these men and their consummate ability in guiding that ship of theirs through troubled waters. Mr. Vandy concluded by saying that the members had a heritage which they should keep unstained.

Mr. S. W. Newcombe (Chairman of the News Department) described the news section as the strongest arm of trade unionism in the world. He wished other sections of the Society were as strong. He would like to tell them that the news section had been recruited from the general trade. (Cheers.)

Mr. F. A. Davies (Assistant Secretary) thought the members should be unstinted in their admiration for the pioneers and veterans who had gone before them. It should be their duty to concentrate unceasingly on getting the apprentices who were coming out of their time to become members of the Society. (Cheers.)

At 7.30 p.m. a Jubilee Dance took place in the Australian Exhibition Building. Those taking part in the costume competition for ladies represented various newspapers and trade houses. So good were the costumes that the judging was rendered very difficult, and in the end the prizes, presented by Miss N. Naylor, were awarded to Miss Smith—who entered as "Miss Print"—(Messrs. Suttley & Silverlock), 1; Miss Elliott (Linotype & Machinery, Ltd), 2; Miss Young (*Daily Mail*), 3; Miss Henderson (*The Times*), consolation.

The proceedings throughout the day were carried through with commendable ability by the stewards. It should be added that the L.S.C. Military Band, under the able direction of Mr. Wm. Avery, enhanced the success of the Festival with its musical selections during the sports and at the dance.

European Paper Markets.

Describing the condition of the pulp and paper market, *Svensk Pappers-tidning*, after stating that England is the principal buyer of sulphite, says: The French and Belgian paper mills are practically working at full capacity, but owing to the political and financial situation on the Continent the manufacturers must proceed with the greatest caution, and as a rule they only buy for prompt delivery. The Italian manufacturers have also been in the market, but they take example from France and only fill their supplies from hand to mouth. The sales to Spain, on the contrary, are reduced to a minimum, as the paper industry in that country is going through a severe crisis at present.

With regard to the sulphate market, the sales to European countries have been rather limited and reduced to small parcels for prompt delivery.

Sales of sulphite and sulphate to U.S.A. during this year already represent a considerable quantity, and although they have been somewhat reduced during the last weeks, rather large quantities are still being placed.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion	3/0
Three Insertions	6/0

For every line exceeding three lines 1/.

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion	1/6
Three Insertions	3/0

For every line exceeding three lines 6d

Sales by Auctions, Tenders,

Gray's Inn-road, London, E.C.1.

Occasionally we have Rebuilt Smyth Book Sewing Machines to offer, such Sewers having been thoroughly overhauled and refitted with New Standard Parts where necessary. We erect and teach on a trial basis.—Box 13993.

Albert E. Reed and Co., Ltd.

In order to qualify for dealings on the Stock Exchange, particulars have been published of an issue of £300,000 6 per cent. First Mortgage Debenture stock by Albert E. Reed and Co. The firm is one of the best known in the papermaking trade, and has an authorised capital of £525,000, of which £300,000 is in 6½ per cent. Cumulative Preference and £225,000 in ordinary shares, all the latter and £240,000 of the former being issued.

The debenture stock has a specific charge over the freehold Aylesford, Tovil, Bridge and Farncombe mills, and a floating charge over all the other assets. The company has power to borrow up to the amount of its issued capital for the time being, but the sum raised on debenture or debenture stock is limited to £300,000. The stock now introduced to the market is redeemable at par by July 1st, 1966, through the operation of a cumulative sinking fund of 1 per cent., beginning July 1st, 1927, and operating in drawings at par or in purchases below that figure.

The company, however, reserves the right to pay off the whole or any part of the stock at any time on six months' notice, but if it exercises this option before July 1st, 1933, the redemption price up to June 30th, 1928, will be 105 subsequently 102½. Thereafter the figure will be par, as under the regular drawings. The stock has been sold at 95½, less a brokerage charge of ½ per cent.

THURSDAY, JULY 12, 1923.

Out of Print.

READERS of the *British and Colonial Printer and Stationer* who are not already on the subscription list are advised to remedy that defect. We are induced to give this warning by the fact that on several occasions lately the current week's issue has been out of print soon after publication. Gratifying as is this evidence of appreciation, we must regret the disappointment of those who desired to secure copies. The only way to ensure obtaining the *British and Colonial Printer and Stationer* is to give an order by means of the subscription form on page 27. Our publication is more widely read than ever, and the special issues make a particular appeal. Last week saw the first of the numbers devoted to lithography and offset, and since the issue has been out of print there has been a big demand for copies. Apart from the special issues, which also, of course, include bookbinding and export, the *British and Colonial Printer and Stationer* is full every week of live matter of real interest to all concerned with printing and the allied trades.

* * *

L.S.C. Jubilee.

THE L.S.C. has a wonderful record. In spite of its 75 years, it is still as big a fighting force as it ever was. In order to celebrate the 75th anniversary the officials of the Society organised a wonderful series of events at the Crystal Palace on Saturday. A striking feature of the occasion was the presence of several former secretaries of the Society, including Mr. Drummond and Mr. Bowerman. In addition, there were many other old adherents who are well advanced in years and yet who have all the vivacity of youth. There are surely few societies which can claim so many "old-young" men who are still keenly interested in the trade union movement. Mr. T. E. Naylor, the present general secretary, carries on the traditions with great ability and the record he presented on Saturday was one of which any one might be proud. He was able to show for instance, that during its 75 years the membership of the Society had increased from 1,500 to 15,000, and the income from £1,000 to £100,000. Fine as the past record of the Society has been, it is still performing a valuable service to its members, as our report of the proceedings will show, and the fact that all the funds, as was pointed out by Mr. Bowerman, come from the payments of the members themselves is a remarkable achievement in one section of the great printing industry.

* * *

Foreign Paper on Offer.

THERE is an amount of foreign paper of various kinds on offer at prices well below the market level. White bank papers at 3½d. per lb., krafts at £24 per ton, manillas at less than 3d. per lb., are a few among others. Such papers can only be of German origin and nothing but the abnormal condition of the rate of exchange is responsible for their presence in our market. It is a rank injustice to manufacturers not only in England but also in the countries where attemps are being made to re-establish financial soundness, that five years after the war they should find themselves suffering from the effects of an endeavour to make Germany pay. Entirely from a selfish point of view so far as we are concerned the only thing that can help the situation is to make Germany recover her money standard. Then there would be a greater incentive for her manufacturers to cater to home requirements. Under existing conditions the only business worth entertaining by them is that for export.

* * *

Esparto Paper.

A REPRESENTATIVE of the paper mills up North informs us that the esparto mills are actually busy and that the order books contain a good sprinkling of Colonial business. From another direction we learn that profit margins on papers made in the esparto mills are a somewhat variable factor. Certain lines pay their way, others show a slight loss and some come out at change for a shilling. Over the whole production there accrues a profit, small but real and as much as can reasonably be expected in trading times like these.

* * *

The Old Personal Touch.

SOME few years ago it was the habit of certain mill and wholesale merchant managements to keep in personal touch with their representatives at branch depôts or out on the road. We recollect the letters which were sent down every week from the head of one of the biggest houses in London to his provincial salesmen, and we remember clearly the good relationship which they created. It is doubtful if the more scientific co-operation promulgated as a post-war fashion or development produces a better result or anything like the same feeling that came as the result of the old personal interest. Not that it has altogether died out (although amalgamations, conversions and absorptions have pretty nearly stifled it), for we know of cases which still exist to demonstrate the spirit. Mostly they are confined now to the mills. In one particular case with which we are well acquainted, the mill representatives are in constant direct personal touch with the head, who keeps his men posted up with all the moves in the market, the trend of trade, and events of importance or interest.

A GREEK Legislative Decree imposes the following duties (per 100 okes) in metallic currency: — Lithographs, engravings on copper or wood, chromo lithographs, chromo-photographs and various other prints (1) on paper, General Tariff, 300 drs., Conventional Tariff, 250 drs.; (2) on pasteboard or paper stuck on pasteboard, General Tariff, 120 drs., Conventional Tariff, 100 drs.; (3) on metal, General Tariff, 60 drs., Conventional Tariff, 50 drs.

Personal.

THE Federation of Master Printers has decided to recognise the invaluable and long-continued services of their retiring president, Mr. R. A. Austen-Leigh, the proposal being to present him with his portrait. Subscriptions are limited to a maximum of two guineas, the Council being anxious that the list should embrace as many names as possible.

MR. AUSTEN-LEIGH is one of the original members of the Federation Costing Committee and was president of the London Master Printers' Association, 1920-22. In these capacities, as well as representative of the Federation to many conferences on the Continent and in America and by his visits to every corner of the United Kingdom, he has done yeoman service to the industry.

SIR MEREDITH T. WHITTAKER was entertained to lunch at the Connaught Rooms on Wednesday in recognition of his services to the newspaper and printing industries during his official association with the Linotype Users' Association from its inception from May, 1902, until its natural incorporation with the Newspaper Society in May last year.

MR. R. A. AUSTEN-LEIGH presided, and occasion was taken to present Sir Meredith with his portrait in oils, and a gift was bestowed upon Lady Whittaker.

MR. C. A. BATES (Johnson, Riddle and Co. Ltd.), returned from America on Monday after attending the advertising convention in that country. He speaks warmly of the hospitality offered in the States.

LORD ASKWITH is suffering from a sprain o the cartilage of the knee, caused by a fal down a short flight of steps. He was com pelled to take complete rest for a few days.

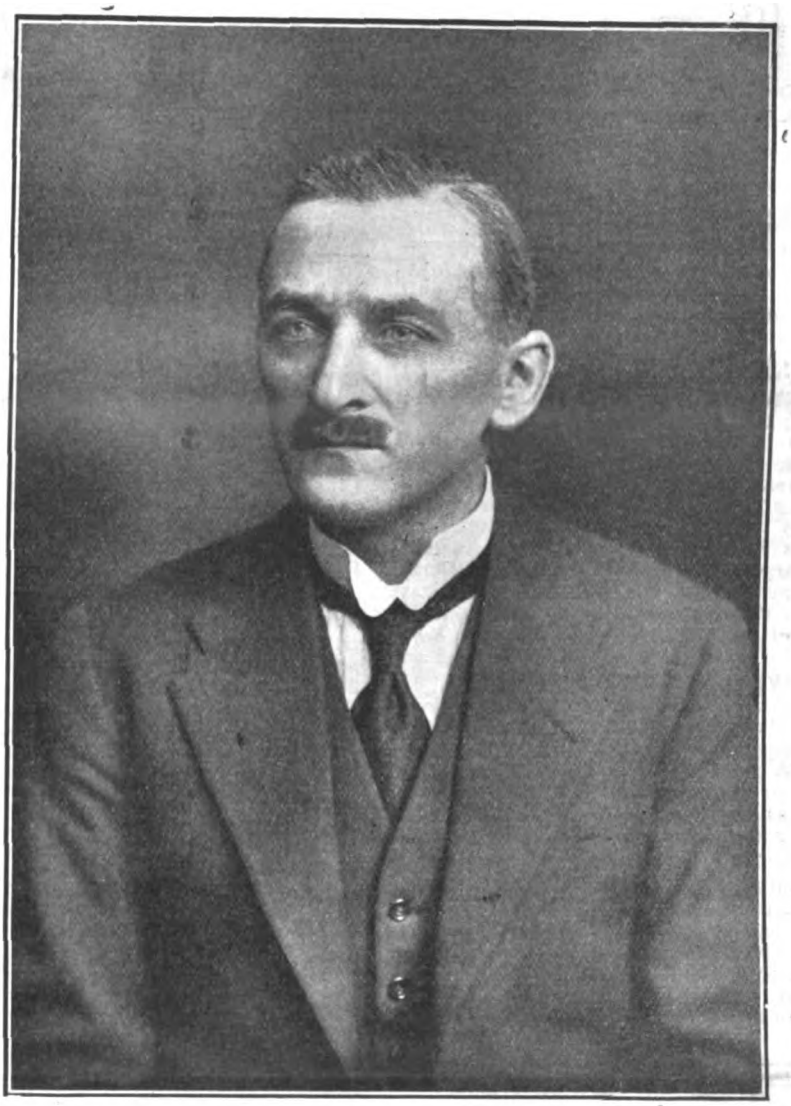
SIR W. E. BERRY has intimated that the donation of £1,200 on behalf of his sister, Mrs. Berry Jones, his brother, Mr. Gomer Berry, and himself for the endowment of a bed at Merthyr General Hospital is in commemoration of the freedom of the borough conferred on Mr. Seymour Berry on Friday. The bed is to be named after their mother the late Mrs. J. M. Berry.

MR. R. ANDREW SPOTTISWOODE, son of the King's Printer, is to be married on July 18th to Miss Iris F. Watson.

MR. E. H. ATKINSON, who delighted the South-West London Master Printers with the address on blockmaking which appears on another page, is the proprietor of Messrs. Garratt and Atkinson, process engravers, Ealing.

MR. E. G. COLE, the president of the local association, was in the chair, and warmly thanked Mr. Atkinson for his instructive discourse.

MR. SIMNETT, the vice-president, made a valuable addition to the discussion from his experience of three-colour process work.



LADY VEZEY STRONG is making excellent recovery after her recent operation, and would like to thank her friends for the many very kind messages and beautiful flowers that have been sent to her.

MR. T. E. GREENHOUGH, the manager of Messrs. W. H. Smith and Son's wholesale branch, 61, Dale-street, Liverpool, retired on June 30th, after 55 years' service with the firm. He and Mrs. Greenhough were entertained to dinner, and received gifts from the staff.

MISS NAYLOR, daughter of Mr. T. E. Naylor, was successful in winning the one-lap (quarter-mile) ladies' walk at the sports held at the Crystal Palace on Saturday in connection with the Jubilee celebrations of the London Society of Compositors.

THE wedding has taken place at Bradford of Mr. W. E. Riley, of the staff of the *Bradford Daily Argus*, to Miss Elsie Price, of the *Bradford Daily Telegraph*. Mr. H. C. Derwent made a presentation on behalf of the combined staffs.

Mr. W. LINTS SMITH.

Mr. W. Lints Smith, the President of the Printing and Allied Trades Charity Sports Association, has always taken a keen interest in the charities of the printing trade. He identified himself very early with the Caxton Home, and through his efforts one of the beds was endowed. Last year he succeeded in raising £1,005 for the Anniversary Festival of the Printers' Pension, Almshouse and Orphan Asylum Corporation. The staff of *The Times* has always been able to enlist his sympathies in any domestic financial hardships.

He is one of the few managers of newspapers throughout the world who has had extensive experience on the editorial side. He began his career as a reporter in Aberdeen and occupied a similar position in Bradford. At twenty-one years of age he was editor of a Lancashire weekly paper, and for some years he occupied the position of chief of the reporting staff of the Central News Agency; he was subsequently news editor of the *St. James's Gazette* and the *Evening Standard*, and was for seven years Lobby correspondent of the latter paper. After filling the chair of the *Sporting Life* for three and a half years, he was invited by Lord Northcliffe to become the associate manager of *The Times*, and was appointed general manager in December, 1920.

Master Printers' Federation.

Council Meeting.

A meeting of the council of the Federation of Master Printers was held on Tuesday at the Holborn Restaurant, and a number of important matters relating to the organisation were discussed.

The British Delegation to the Gothenburg International Conference presented their report, and Mr. C. A. Bates gave a brief message as to his trip to America, where he attended the Advertising Convention.

The report of the Labour Committee was of an interesting character, giving details of the conferences with the T.A., the lithographic unions and the binders' union. It was intimated that further conferences were to take place with the T.A. on the question of their rules and also with the Printing and Kindred Trades Federation regarding certain decisions of the Hours and Holidays Committee and in regard to the use of time-checking devices.

The Organisation Committee reported on the steps that were being taken to increase the membership and to revise the rules of associations and alliances.

The secretary stated that he had visited the North Wales and South Western Alliances, and encouraging results were anticipated from the efforts of the new presidents of these bodies.

The chairman of the Legislation Committee outlined the activities of this committee, and considerable interest was taken in the questions which had been asked in Parliament regarding State printing.

Mr. A. F. Blades made a stirring appeal on behalf of the War Orphans Fund organised by the Printers' Pension Corporation, and stated that unless immediate help was forthcoming they would not be able to carry out their programme of helping all the orphans on their list.

PRESIDING over the third annual congress of the Empire Press Union, on Monday, Viscount Burnham stressed the importance of wireless telegraphy, and insisted that the Government should show business capacity in dealing with the problem.

F. NEWMAN AND CO., of 56, Ludgate-hill E.C.4, will, on Monday, July 9th, vacate their present offices for more convenient and commodious premises on the ground floor at the same address. This change, which has long been necessary, will enable this firm to cope successfully with their rapidly increasing business.

A GOOD salesman never undertakes to make a prospective buyer feel that he doesn't know what he needs.

(paper manufacturers, etc.).—Trust deed dated June 28th, 1923, to secure £300,000 6 per cent. first mortage debenture stock, charged on paper mills and lands, etc., at Aylesford and Tovil, Kent, and Farncombe, Surrey, and company's undertaking and property, including uncalled capital. Trustees: Bank of Liverpool and Martins, Ltd., 68, Lombard-street, E.C.

J. W. MARSHALL AND CO., LTD. (manufacturers of and dealers in paper, pulp, chemicals, etc., Bolton).—Satisfaction to the extent of £2,000 on February 12th, 1917, and £1,000 on June 8th, 1923, of debentures dated May 19th, 1916, securing £3,000.

RICHARDSON AND CO., TIN PRINTERS, LTD. (Birkenhead).—First mortgage debenture dated June 13th, 1923, to secure £10,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: J. S. Stubbs, 21, Albert Drive, Aintree, Liverpool.

ENOCH AND SONS, LTD. (music publishers, etc., London).—Issue on June 11th, 1923, of £100 debentures, part of a series already registered.

EDSON (PRINTERS), LTD. (London).—Debenture dated June 23rd, 1923, to secure £4,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C.2.

ODHAMS PRESS, LTD.—Issue on June 5th, 1923, of £25,000 debentures part of a series already registered.

SOPER AND WHEELER, LTD. (stationers, printers, etc., Brighton).—Particulars filed of £750 debentures authorised May 28th, 1923, charged on the company's undertaking and property, present and future, except uncalled capital, the amount of the present issue being £500.

BANKRUPTCIES, etc.

Re JOHN RISSEN, LTD., Stationers, Printers, etc., Clerkenwell House, Clerkenwell-green, E.C.—The report of Mr. J. Barwick Thompson, official receiver, upon the affairs of this company (in liquidation), under date June 14th, 1923, states that up to that date the assets had realised a gross sum of £7,110, and the outstanding assets may realise £1,842, making a total of £8,592. That sum will be insufficient to meet all the claims of the debenture holders, consequently there is no prospect of funds becoming available for the unsecured creditors and no return can be made to the shareholders. The senior official receiver remains liquidator of the company.

Birmingham Printeries, Ltd.

Twenty-First Anniversary Wayzgoose.

A stylishly printed programme was prepared for the 21st anniversary wayzgoose of the Birmingham Printeries, Ltd. This event was celebrated on June 30th by a trip to Tewkesbury. Enclosed in a cover of delicate grey, the pages of the programme are artistically ornamented and the body matter, in a narrow column flanked by a panel, neatly displayed.

The party left Birmingham at 8.0 a.m. and a happy day was spent at the historic city, with a trip on the River Severn during the afternoon. Dinner and tea was served at the Lower Lode Hotel, and music was provided for dancing on the green.

Interest was added to the occasion by the historic account of Tewkesbury, its abbey and its battles which appeared on the programme, the panel which added so much to the appearance of each page, containing the title for the letterpress and an appropriate caption.

Barnet Printers at Southend.

The male members of the Stellar Press, accompanied by their genial manager, Mr. H. W. Clark, celebrated the third anniversary of the firm by an outing to Southend by charabanc. Starting from the works soon after 8 o'clock, the party arrived at their destination at 11.30. The rest of the morning was taken up with promenades, and, for those with athletic inclination, swimming. A five-course luncheon awaited the party at the "Ship" Hotel, and the repast was thoroughly enjoyed. After the usual toasts were drunk, interspersed by short speeches, a pleasant brake drive was arranged to Shoeburyness and surrounding neighbourhood. High tea having been served, a delightful charabanc ride home in the evening brought the day regretfully to a close. The success of the outing was to a large extent due to the able efforts of the stewards—Messrs. E. S. Watts and A. J. Southam. Every member was presented with a tasteful souvenir to commemorate the occasion.

Additional U.S. Duty on Paper.

United States Customs collectors have been advised to assess an additional duty of 10 per cent. *ad valorem* (under Sec. 304, Tariff Act of 1922), on all paper imported from Canada "not properly marked, branded or stamped," on and after April 15th, 1923. The question arose on the importation of "so-called mill wrappers, a low grade of paper imported in rolls."

French Customs Decisions.

Some decisions have recently been made by the French Customs Department with regard to the classification of certain articles under the French Customs Tariff. Accordingly apparatus for verifying the dryness, fineness or purity of paper pulp is classified for duty as "apparatus, etc., for experiments and instruction, etc. (No. 634 quat.") Ordinary paper, pasteboard or cardboard reinforced with a sheet of cork has the same duty as "manufactured cork in sheets (No. 633)."

Manchester College of Technology.

Coming of Age Celebration.

The Manchester College of Technology celebrated its 21st birthday with fitting ceremony on Thursday last week.

Viscount Burnham attended and delivered two appropriate addresses. Speaking in the evening at a conversazione over which the Lord Mayor presided, His Lordship had some arresting observations to make concerning vocational education.

The College did well, he said, to look to all that was developing in the educational systems of the world. For the last two years he had been much involved in international questions touching trade and industry, as president of the International Labour Conference, and he found that the intense and ardent desire to make the best of all the educational values that we had was not confined to this country nor to the English-speaking countries, but was common to the whole of the civilised world. In nearly every country intense interest was felt in two new lines of educational activity—vocational guidance and vocational selection. Experience had shown that quite a number of young people of both sexes were obliged after a time to change their trades, because they had not the ability to follow them successfully. Such changes were as injurious to the employers in an industry as to workers themselves. Vocational guidance, he believed, was going to be a great and urgent problem in our national education in the next few years. The elimination of the misfit in industry and in the application of science was a matter of vital importance. What should be aimed at, of course, was the distribution of young people among occupations according to their abilities and inclinations, so that each might enter an occupation in which he could give his best and have real joy in his work.

For the evening conversazione an interesting demonstration and exhibition of the College activities were made. In papermaking technology the institution has long taken a prominent place. Visitors, therefore, saw paper being made by hand and on the Fourdrinier machine which does such good practical service in training the students.

Again on the printing side, there was evidence of the College's fine equipment. Thus the composing rooms in printing and photographic technology contained excellent examples of work in typography produced by the press of that department, and printing presses were shown in operation. Lithography, offset printing and photo engraving were also demonstrated.

French Paper Developments.

The profits of Papeteries de France for the year ending December 31st, 1922, amounted to 3,824,853 francs.

Fabrique de Pâte à Papiers de St. Rivalain has been formed principally to undertake the alteration of the St. Rivalain Paper Mill, France, with a view to the use of straw, alfa and other plants for cellulose. Capital 2,500,000 francs.

Société pour l'Exploitation des Procédés Vains has been formed for the manufacture of cellulose by the de Vains process in France and French colonies. Capital 1,000,000 francs.

THE British Chamber of Commerce, Paris, this year celebrates its Jubilee, having been established in 1873.

Disinterested Advice.

In "Notes for Buyers," the house organ of Messrs Spicers, Limited, "Ubique" writes: "By the way do you take in the weekly journal of the craft, the 'BRITISH AND COLONIAL PRINTER AND STATIONER'? I haven't a farthing of money interest in it, but fair's fair; and when I see this country producing a weekly printing trade paper which the craft in other great countries cannot produce, and when I see such plenty of good craft matter in it, I feel constrained to put in a word about it. You are surely not doing yourself justice unless you take it and regularly glance over it."

Printers' Managers and Overseers
(PARENT) ASSOCIATION.

Adoption of Annual Report and Balance Sheet.

The July meeting of the Association was held on Tuesday of last week at the headquarters, the "Old Bell," Holborn, E.C. The chair was occupied by Mr. S. M. Bateman (president), and though the meeting was not a large one, considerable interest was shown by those present in the matters that came up for consideration. The principal items on the agenda were reports from the delegates who had attended the Leicester conference and the presentation of the annual report and balance sheet.

Report of the Delegates.

The delegates from the London (Parent) Centre to the Leicester Conference were Messrs. S. M. Bateman, A. E. Jarvis, J. C. Pugh, and E. W. Whittle, general secretary.

Mr. Bateman, who spoke first, referred in eulogistic terms to the manner in which the Leicester Conference had entertained the delegates and their friends. Small though that Centre was, it had succeeded in doing everything possible for the comfort and enjoyment of those who had attended the conference. So far as concerned himself and the general secretary, they were treated in the most friendly spirit.

Mr. Whittle, who followed, dealt with the resolutions put forward by the various centres. The first question considered by the Conference, said Mr. Whittle, was the *Managing Printer*, and after some discussion it was agreed that £10 be allotted to each centre, and that the balance be devoted to the general fund. Around the discussion of the Notice Question points were raised as to what constituted a "working overseer," and what should be the duty of the overseer in the event of a trade dispute. Regarding the Unemployed Benefit, Manchester brought forward a resolution similar to the London one, but it was more clearly worded, and would be put before their own members in September. A resolution on superannuation, introduced by the Liverpool Centre, was referred back to that Centre to be eventually presented to the Parent Body. Another matter of importance that came before the delegates was the venue of the 1924 united gathering. Though Edinburgh might be happy to entertain them, the question of expense was thought to be the drawback. A recommendation was made that a grant of £20 be made from the general funds to any Centre in whose area the united gathering was held.

Mr. Pugh spoke chiefly on the question of the difficulty of smaller centres entertaining the larger ones at the annual gatherings. Leicester with 35 members had gone to a great expense in entertaining over 100 people, and every local member had pledged himself to the extent of £1 towards the expenses, and he thought it only right and proper that the smaller Centres should be entitled to apply to the General Fund for assistance. The Conference was carried on from start to finish in the most harmonious manner and it was the most friendly gathering he had ever attended.

Mr. Jarvis said he thoroughly endorsed every word said by Mr. Pugh regarding the harmonious proceedings at the conference. The president had carried out his duties in a very able manner. Mr. Pugh had argued the case of the "Managing Printer" with as much tact as any lawyer, and in the end the delegates all came to the conclusion that London's finding regarding it was the correct one. At the conference there was a desire amongst all the delegates to find a solution to their difficulties and they found it.

Annual Report.

The annual report, in the hands of the members, was next considered. In it the Council state that they have had to deal with a period of general depression in the printing trade, difficulties being accentuated by the uncertain position of the wages question during part of the time under review. While these events, continues the report, have not seriously affected the Association, they have influenced in a degree the Association's advancement in funds and membership.

Under the heading of membership, the report states that there has been a net gain of 35 in the year. During the year the membership for the 10 centres stood at 1,381, as against 1,346 in the preceding year and 1,320 during 1920–21.

In considering the general fund, the report states that as compared with last year the balance to the credit of this fund shows a decrease of £23 14s. 6d. It also mentions the fact that continued prevalence of unemployment had materially contributed to this result, and that failing some alleviation of the position, it may be necessary to consider the re-adjustment of the present scale of payments.

Losses by death during the year numbered 11, and considering the Association have many members past middle age, the mortality was not considered excessive. Amongst those who have departed were several members well known in London and Provincial Centres and to the memory of one and all the Council tender a tribute of sincere regret.

Passing to technical education, the Association continues to take an active part in all matters appertaining to this subject, and special mention is made with regard to the first payment towards establishing the new Printing School.

The total value of the Association's assets are shown to be £4,150 3s. 4d., as against £3,572 2s. 10d. in the previous year.

Regarding the social side of the Association's activities the report states: With other kindred associations they were recovering from the depressing influences of the Great War and its aftermath, and social meetings were again assuming their rightful position in all centres. The recent gathering at the King's Hall, London, was a pleasant indication of this, and the gathering at Leicester provided ample opportunity for the renewal of old friendships and the formation of new ones.

In conclusion, it is stated that the success of the Association in the future, as in the past, mainly depends upon the activities of the members, with due regard to efficient and careful management in all centres. The necessary introduction of suitable candidates for membership is a need that is always present, and the Council rely upon the missionary efforts of members and friends, so that progress may be continuous and prosperity unfailing.

The chairman drew attention to each item of the report separately and invited discussion upon any of the points it contained. None being forthcoming, the report was formally carried *nem. con.*

The Balance Sheet.

The balance sheet was next considered, and as an inducement to the members to comment upon it the president read each item of the accounts separately.

Coming to the account dealing with expenditure on unemployment Mr. S. A. Dawson asked what was the amount paid out under this heading in the previous year.

The general secretary, replying, informed Mr. Dawson what the respective sum paid in 1920-22 to Centres had amounted to, and said the total figure for all the Centres for that year stood at £417, as against the £402 for last year.

Mr. Dawson expressed agreeable surprise at the small sum paid out for unemployment during the year, because he had expected something larger regarding the umemployment account.

A member asked if it was necessary to issue a new list of members every year.

The general secretary said it was necessary because of a lot of changes that took place during the twelve months. It had always been the custom to issue a new list every year.

Coming to the consideration of the Benevolent Fund account, Mr. Bateman said the Scottish delegates had suggested that the balance from the *Managing Printer* should go to that Fund. It had been pointed out to them, he said, that not one member who made application to that fund had been refused.

Mr. Whittle explained that Scotland's idea was that any member applying for benefit under that fund should receive a much larger amount than the rules at present allowed.

Regarding the Death Benefit Fund, Mr. Whittle stated that there had been an increase of £161 compared with the previous year.

A discussion then ensued on the question of the *Managing Printer*, introduced by Mr. Dawson, who asked for fuller details concerning management expenses and commission.

Replies were made by Mr. Whittle and Mr. Pugh.

On the same question Mr. Lloyd then moved that the meeting endorses the action of the Council. This was seconded by Mr. J. A. B. Reed and earried.

Mr. J. French and C. H. Blenkins (auditors) both bore testimony to the efficient way in which the books of the Association had been kept, and the full command possessed by the general secretary over all matters contained in them.

The balance sheet was then put to the meeting and formally passed as printed.

Printing, Bookbinding & Kindred
TRADES OVERSEERS' ASSOCIATION.

The July general meeting of the Association was held at St. Bride Institute, Bride-lane, E.C., on Tuesday, 3rd inst. The chair was occupied by Mr. H. Milton (president), who was supported by Mr. J. Fleming (vice-president).

After the reading of the minutes of the previous general meeting which were duly confirmed, the general secretary submitted correspondence, which included an appeal from Mr. F. C. Peacock for a donation toward the Machine Rulers and Vellum Binders Pensioners' Annual Outing, with the result that a donation of £3 3s. was voted from the funds of the Association.

Mr. Peacock, being present, thanked the meeting for the donation, which, he assured all present, would be much appreciated by the "Old Folk" and all those who had their interest and welfare at heart.

A letter from Mr. J. R. Riddell, principal of the London School of Printing and Kindred Trades, was read. It was a reply sent him by the general secretary to criticism of the Binding Section of the School as expressed at the last general meeting, a report of which appeared in our issue of June 14th.

After the reading of the letter a further discussion took place.

New Member.

A candidate for membership came before the meeting—Mr. Geo. A. Elbra, of Messrs. W. H. Smith and Son, Fetter-lane, E.C.—and was duly elected to membership.

Next ensued a general discussion of items, as they appeared on the agenda. These dealt with various affairs of the Association. Keen interest was displayed throughout, tempered with that feeling of good fellowship which characterises all such discussions whenever they arise.

The members were evidently under the influence of the holiday season, but eventually "other business" was exhausted and a vote of thanks to the chairman brought the meeting to a close.

MR. LOW WARREN, the founder of the *Cinema*, and formerly managing editor of the *Cinematograph Weekly*, has been elected by the Council of the Institute of Journalists a Fellow of that body in recognition of his trade press activities and his recently published book on "Journalism."

A Business Hustle.

Scouring the Country in a Motor Car.

Mr. A. L. Sharpe, managing director of Backhouse and Coppock, Ltd., is now in the midst of his annual summer tour of the principal business centres of England and Scotland. It has become Mr. Sharpe's practice to make the visit once a year by road in his own car, accompanied by Mrs. Sharpe, who relieves him at the wheel from time to time.

Mr. and Mrs. Sharpe left Surbiton on Saturday, June 30th, at 2.15 p.m. for Leeds. After a splendid run along the Great North-road (which is in excellent condition) they reached Stamford at 7.15 and stayed the night at the George, a most comfortable hotel.

On Sunday morning they started off again just before 11 o'clock, and, pausing at East Retford for lunch, reached Leeds just before 4 o'clock—a very pleasant run.

On Monday Mr. Sharpe started in earnest with an early morning visit to Bradford, returning to Leeds, where he spent the rest of the day. Towards evening the car was to leave for York, where Tuesday was to be spent.

The journey North was to be interrupted on Tuesday evening at West Hartlepool, with a visit to some relations of Mrs. Sharpe's.

Early Wednesday morning the tourists were due to leave for Newcastle, and after visiting some business friends in this important centre, soon after lunch the start for Edinburgh was to be made, it being aimed to arrive there in time for dinner on Wednesday night.

After Thursday morning in Edinburgh, a visit to a paper mill in Fifeshire was projected, and it was hoped to reach Glasgow in the evening.

All day Friday was booked for Glasgow; thence in the evening on to Carlisle for the night. In order to enable Mr. Sharpe to keep to his time table, friends in Carlisle have kindly consented to see him on Saturday morning, and after lunch the car starts South again, Saturday night and Sunday being set apart for Liverpool.

A busy Monday morning was projected for Liverpool, with the afternoon in Warrington, and the evening, it was hoped, would find Mr. and Mrs. Sharpe resting at Manchester for the night.

All day Tuesday was to be devoted to Manchester, and the whole of Wednesday at the mills at Macclesfield. With a bit of luck, Wednesday night should be spent at Derby. Thursday is to be occupied with visits to business friends in Derby and Nottingham, Birmingham being the objective in the evening.

The whole of the following (Friday) morning will be spent in "Brum," and at two p.m. precisely Mr. and Mrs. Sharpe hope to start on the last lap home to Surbiton. With any luck they expect to be back soon after six p.m.

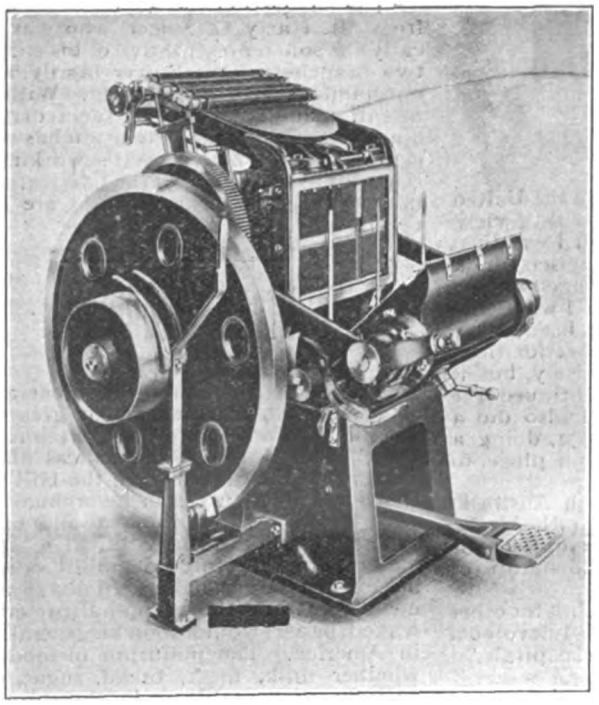
This is a nice little tour of something over 1,000 miles, in the course of which Mr. Sharpe hopes to renew that personal touch with his business friends which is so helpful mutually in conducting affairs to day.

Mrs. Sharpe is certainly of great assistance in carrying out this annual programme, as without her Mr. Sharpe could not possibly crowd this tour into such a short space of time. While he is making calls close at hand his wife gets the luggage aboard and the car ready for the next journey or for use locally.

British Marble Paper.

What is known as the real marble paper, used in the bookbinding and boxmaking industries and imported from Belgium and Germany, is one of the products for which a thoroughly efficient British substitute has been found. This is not a new discovery; printed marble paper took the place of the hand-marbled variety during the war and high wages abroad put the foreign paper out of the running when the war was over. The reason for mentioning these known facts is that they are not known sufficiently. Although imports have ceased to figure to any large extent there is still an amount of foreign marble paper being sold to users. Partly this is due to antipathy, partly to a failure to push the English variety and mainly because some of the home productions are not good. We have seen specimens direct from our best mills in this line and at not much over half the price of the foreign variety the value is all on our side.

Scottish Notes.



(By Our Own Correspondent.)

THE upward tendency in prices of raw materials instead of making a speculative demand for paper, as it did a few years ago, seems to intensify the trade depression which has now existed for over two years. Undoubtedly some mills still hold pretty heavy stocks of paper, which can only be sold at a remunerative price by being retailed in small quantities. "Making orders" are few and far between and the usual falling off in business at this time of the year is more accentuated than ever.

UNDOUBTEDLY there is a general hardening in prices of paper, and to put papermaking on business lines higher rates are imperative; but if higher prices cannot be obtained and buyers of raw materials refuse to pay the advances asked, the cost of these will necessarily have to come down again, unless, of course, some other countries are willing to take the material that we refuse.

IT is difficult at the moment to see from what source a revival in trade will come, but it looks as if lower prices are more likely to be a stimulant than higher rates. In spite of the upward tendency in home-made supplies, we have quotations from foreign countries with which it is impossible for home mills to compete, and yet there is comparatively little business to be done in these papers.

STATIONERY and paper offered to the public by the retail shops are not yet so cheap as to induce people to lay in a stock, and in many cases the prices asked show an almost unwarranted excess on the prices charged to such retail dealers. Trade revival must come in the first place from the public. Can the retailers not do something to stimulate business?

BUILT IN FIVE SIZES.

The SUPERIORITY
of the
TIP-TOP PLATEN MACHINE
is in the
Perfect Impression and Register.

The platen and the base and vertical bed are cast in one solid piece.
Superior inking apparatus of newest type.

Fifty-Eight Years a Wholesale Stationer.

Some Interesting Recollections by Sir Albert Spicer.

The announcement of the retirement of Sir Albert Spicer from the chairmanship of Spicers Ltd. induced a representative of the *British and Colonial Printer* to seek an interview with him in order to obtain some of his recollections of the paper trade. Entering it 58 years ago, Sir Albert has witnessed all the wonderful developments which have taken place during that period. His career almost links up with the abolition of the duty on paper, and indeed he remembers the discussions which took place on this very burning subject. When he entered the business the firm of James Spicer and Sons gave employment to about eight people. Now the amalgamated house of Spicers Ltd. has a staff running into thousands, with branches all over this country and in various parts of the world.

"In looking back," said Sir Albert, "I seem to have outlived all the seniors, who were a fine lot of men, who led the trade in 1865 as well as their sons. I am not sure whether I am the oldest member of the trade at the present time. I have an impression that Mr. Herring is my senior.

"I knew all the heads of the different firms who were our competitors, and personally as a trade we have been very fortunate in the leaders of the distributing trade and the papermakers, as well as our customers, the printers and stationers all over the country, who are a splendid set of men and women."

During the past 58 years there has not been much in the paper trade in which Sir Albert has not taken a part. He is a keen and alert business man, and still continues to take a great interest in his company, attending at 19, New Bridge-street regularly. With justifiable pride he recalls that "I have written my own letters and my own orders."

He has never been averse to putting his shoulder to the wheel when necessary, and recalls that he has helped in his earlier days in transferring stock from one warehouse to another when they were moving from Upper Thames-street, during re-building, to Cannon-street, and afterwards from Cannon-street back to Upper Thames-street.

Branching Out.

Important changes in the system of country travelling were introduced by Messrs. Spicer and Sons.

"Fifty-eight years ago," said Sir Albert, "it was the custom in our trade for most travellers to cover the whole country, and they were often away from their homes for months at a time. This appeared to us unreasonable, so we divided the country into spheres of influence and put different travellers down in various centres so that they might be at home three or four nights a week. As they were successful in their different localities, we provided them with small rooms in a convenient centre and afterwards with stock.

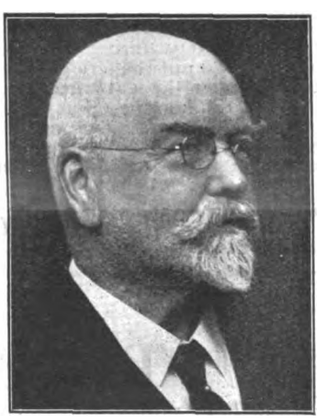
"This was the origin of our branch house system. The only business we bought was that in Birmingham, all the others growing up naturally from the system we had adopted of putting down travellers in the various centres.

"The establishment of branch houses had another advantage, in that they enabled us to give better positions to some of those who had served us well, and whom we felt were worthy of promotion."

Influence of the Education Act.

Sir Albert's period in the paper trade has been an interesting one, because he saw the introduction and the carrying out of the Education Act of 1870, and served 15 years on the School Board of the district where he resided.

"It was that Act and the education that was the result of it," he observed, "that has enabled the circulation of newspapers not only in the great centres but all over England, to increase from thousands to millions, and the same remark applies to books and the uses of writing paper.



"In my earlier days we used to supply the newspapers with a certain quantity of stamped paper, the paper for which had to be taken to Somerset House, where it was stamped, and then re-collected and forwarded into the country, naturally a slow process, and only suitable for small circulations.

"During this period, with the enormously increased number of readers, the improvements in printing have been very great, and it has been the constant object of houses like our own to point out the needs of the printers to the papermakers, who, on their part, have been constantly improving their qualities, their finish, and so on, to enable them the better to meet the requirements of the printer."

Travels Abroad.

During his career, and especially in his early days, Sir Albert has acted as a pioneer of paper commerce in travels abroad. Speaking of his journeys overseas, he says:

"I toured Canada and the United States as far as San Francisco in 1869, when the new railway had only been opened four months, and when the countries west of the Rocky Mountains, though belonging to the United States, would not accept the currencies of the Eastern States. Accordingly we had to carry 20-dollar gold pieces, a very inconvenient

SIR ALBERT SPICER.

form of currency. In Canada and the United States the journeys were made with a view to opening up business, although I was then but 22 years of age. In San Francisco I took one of the largest orders that we had handled at that time, and I confess that I wondered during the next night, having been away from close touch with the market for three months, whether I had acted wisely, but it turned out all right and we continued the business for about two years. I also did a winter journey in Canada 1870–71, doing a town a day and travelling from place to place during the night.

"I have also travelled through Australia and New Zealand as well as South Africa, but my visits to these countries and the calls on customers were more in the nature of courtesy calls.

"I went through India in 1882, but for other than business purposes, although I devoted a little time to business in the chief capitals."

Parliamentary Contests.

Of the public activities of Sir Albert Spicer, which cover so vast a field, it is impossible to speak in detail here.

It may be mentioned, however, that simultaneously with an active business career, he has fought eight Parliamentary contests, five of them successfully and three unsuccessfully.

"My first in 1886," he says, "was undertaken almost at the command of my father, who was very anxious that there should not be a walkover in the constituency of Walthamstow, and he not only issued his orders, but he paid the bulk of the bill of costs in that first contest. In all the other seven I had to bear the full burden myself.

"My father was a strong senior, and always backed us when in his absence we had acted. It was his desire that I should undertake a certain amount of public work outside my business career. My journeys to the Colonies, as they were then called, were also undertaken not only with his consent, but the earlier ones at his instigation, for he had long taken an interest in the Colonies in connection with the Congregational churches of those countries."

Loyal Co-operation.

Sir Albert then went on: "You are asking me to speak about myself and some of the successes I have had. I should like to state very clearly that had it not been for the loyalty and the co-operation, first of my father and brothers, and later of my nephews and sons, I could not have carried through the public work into which I have been drawn. There is, however, one advantage for a business man to undertake a certain amount of public work; it is always enlarging his outlook and enabling him to see new opportunities which, apart from wider experience given by public life, might not have occurred to him.

"I have tried to follow two rules in my business life. In the first place, I have not attempted to do what I could get somebody else to do for me, and, secondly, I have always refused to fill in blanks for those with whom I was co-operating. When consulted on any question I wanted to know first what the co-worker thought himself, and then possibly my extra knowledge and experience might be of help."

A Happy Consummation.

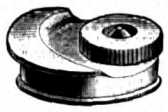
Sir Albert made the following interesting reference to the recent amalgamation:—

"My active career has, in the main, now come to an end with my retirement from the chair of Spicers Limited, though I remain a director, and as long as I have health and strength I shall hope to be of a little assistance. The amalgamation of the two old firms has been a great joy to me. I started on this site on January 1st, 1865; the dissolution of Spicer Bros. took place on August 1st in the same year, when I went with my father and eldest brother to 50, Upper Thames-street. I need hardly say that the competition at first was very severe, although the personal relations were soon resumed, whilst the business relations were softened by the fact that, through the advice of an old family friend, we did not take one another's employees, so that we competed with one another in the same way as we competed with other of the large houses.

"The suggestion for amalgamation came from Mr. Harry G. Spicer, who was practically the sole representative of his side of the two branches of the Spicer family, whereas our numbers were much larger. With determination and good-will, he succeeded, and I am quite sure the amalgamation has been the right thing, and after a year's working I am thankful to see how well the two teams of our fellow workers in the business are pulling together."

Bread Wrapping.

"In the distribution of food generally, but of bread in particular, much greater care should be taken to prevent contamination," Dr. Charles E. Goddard, medical officer of health to the Harrow-on-the-Hill Urban District Council, urges in his annual report. "We know now that the wrapping of bread can be undertaken as a practical scheme. It only requires the force of public opinion to induce the larger bakers to make a commencement and the wrapping (preferably in waxed paper) would soon be general, as it is in America. The pollution of foodstuffs—whether milk, meat, bread, sugar, etc.—is entirely preventable. It therefore seems foolish that more active measures are not taken, but one fears that little will be accomplished in the direction of prevention until the local authorities are granted powers to compel vendors to take ordinary precautions."



MESSRS. E. A. BRISTOW AND CO., papermakers' agents, of 23–28, Fleet-street, London, E.C.4, have opened a branch office at 1, Princess-street, Manchester, under the direction of their northern representative, Mr. B. R. Nicholson. The latter gentleman, it may be mentioned, has for the last 20 years represented the North of Ireland Paper Mill Co., Ltd.

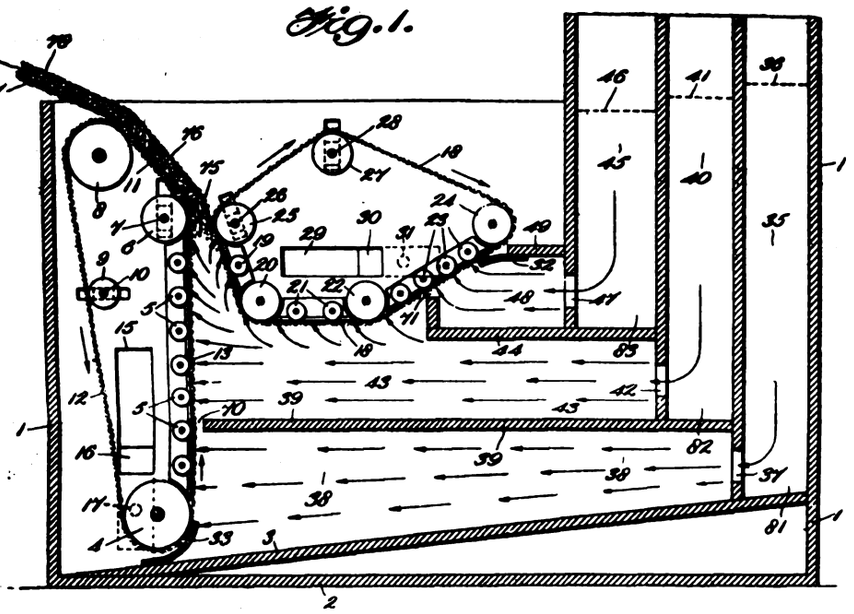
New Inventions



Fibre Board.

We have already referred to the invention of Mr. J. Kershaw Shaw for the production of a board in which the interlacing of the fibres is a special feature. An illustration of the apparatus suitable for making the board is given herewith.

It is preferred to use long fibres, but, of course, fibres of any usual length may be employed. By reason of the flow of the water through the restricted orifices 37, 42 and 47, the velocity of the fibres is increased while they are at the same time crowded more or less closely together.

The fibres are then liberated in the relatively very large chambers 38, 43 and 48, and moved at a slower velocity, so that they are subjected to the lateral force or pressure of the water, to separate them. The result is, long before they reach the belt 11, or surface 13, they will be brought into positions more or less parallel to each other, and more or less perpendicular to the line of travel of the surface 13, while at the same time the fibres will occupy positions more or less staggered with relation to their neighbours.

Fig. 1.

As a result of the entanglements of the various fibres, and the motion of the surfaces 13 and 18, the mass of fibres is carried through the opening 75, between the compression or compacting rolls 6 and 25, and is formed into the sheet or board 76. The fibre board resulting from the foregoing procedure will differ essentially from prior boards in that no such pronounced interlacing of the fibres had ever been accomplished. In fact, the processes producing the latter have stirred or continuously agitated the stock instead of floating it in comparatively quiet chambers, such as 38 and 43, and they have thus effectually prevented the kind of interlacing forming an important feature of this invention.

Another important feature of this invention, says the inventor, in addition to providing a board with its fibres thus interlaced or entangled throughout the body of the sheet, is had by being able to vary the kind, size and class of fibres in different portions of the sheets. That is to say, I may feed to the channel 35, one kind of fibres, which may be relatively shorter or more expensive fibres than are those fed to the channel 40; and I may feed to the channel 45 the same class of fibres as are fed to the channel 35, or I may feed to said channel waterproofed, fireproofed or a totally different class of fibres. In other words, I may provide as many channels 35, 40 and 45, as there are different characters of fibres in the finished board, and I may place in the first channel 35, and in the last channel 45, waterproofed, fireproofed, or any character of fibres I desire, whereupon the finished board will be provided with an outer layer corresponding to the fibres that are fed to the channel 35, with another outer layer corresponding to the fibres that are fed to the channel 45, and with one or more intermediate fireproofed or waterproofed layers corresponding to the character of the fibres which are fed to the channel 40 and to any other channels which may be located intermediate of the channels 35 and 45.

It will now be understood that the important feature of this invention is the fact that no matter how many kinds of fibres or how many layers of fibre that are present in the finished board, the fibres of each layer are interlaced or entangled with the fibres of its adjacent layers, or contacting layers, so that the board does not consist of separate and distinct layers somewhat like the leaves of a book that can be peeled off, as is the case with prior paper and other similar fibre boards, but its body portions consist of fibres that are firmly interwoven, and its outer layers are firmly interwoven with said body portion. I am thus enabled to produce a fibre board or sheet, having comparatively inexpensive fibres on its interior and comparatively expensive fibres on its exterior, and with all of said fibres interlaced, so that a highly ornamental appearance can be imparted the finished product of a maximum durability at a minimum of expense.

In order to provide a better board, I prefer to permit a very large proportion of the water—say 90 per cent. of the same—to escape through the opening 15, while a very much smaller proportion, say 10 per cent., escapes through the opening 29. The gates 16 and 30 are conveniently manipulated to effect this division of the water, while maintaining the proper steady flows through the surfaces 13 and 18 to produce the desired results. But, of course, the proportions of water that escape through the two openings mentioned may be widely varied according to the particular results sought in the finished board.

A further means of securing a more perfect interlacing of the fibres, than heretofore, resides in the provision of the pockets 81, 82 and 83 below their corresponding openings 37, 42 and 47. These pockets cause a sort of churning action of the stock before passing said openings, and this action loosens up any knots or lumps of fibres that may exist, thus causing them to more effectually separate after reaching the chambers 38, 43 and 48, and to therefore more effectually interlace upon reaching the surface 13 and 18.

LOVE'S PAPER RECOVERY MACHINE.

Patented (No. 144485) by Joseph Love.

THIS Machine has been invented for the purpose of speedily recovering the small quantities of paper left on centres or spools which are thrown out from Printing Machines, etc. (commonly known as "Reel Ends"), so that it may be cut into suitable sizes by the Guillotine.

CHIEF ADVANTAGES:

1.—No spindles, bars, or cones are required, the reels being kept in position by a patent spring device thus saving time and labour in loading and unloading.

2.—It occupies a space of only six feet on the run, and is quite noiseless.

3.—The power required is such a small amount that it can be driven from any existing shafting.

4.—Centres of any kind or width can be worked on the machine.

5.—It can be run at the high speed of 500 feet per minute, and will recover approximately 3 tons of paper per day.

6.—It can be constructed to suit all requirements in the off-cut trade, and is equally valuable to Printers or in Paper Mills.

MACHINES SUPPLIED FROM STOCK.

"Fryotype" Melting Pot

SAVES LABOUR. SAVES MONEY.

A "Fryotype" Melting Pot is not a luxury; it is a necessity. It is not an expense; it is an economy. Nearly 200 Printers have installed these Melting Pots during the past 12 months, and while you are reading this they are saving labour, time, gas and metal.

Send for descriptive folder and learn how you, too, can save money.

Over-Equipment of Printing Offices.

Major D. P. Forman Directs Attention of Master Printers to a Managerial Pitfall.

The over-equipping of our works is very like another bad habit, viz., that of not drawing trumps at bridge. That is to say, we all know we ought to draw trumps, and we all, more or less often, fall into the error of not drawing trumps when we ought, and we all pay the price for our sins Over-equipment is of a very similar nature. We all know that we are unwise to put down an over-plus of machinery, and we all do it at times, and we all have reason to regret it later on even if we don't realise it. The whole matter is really a question of arithmetic, and therefore I propose to give you certain figures from an American magazine—from the official magazine of the American Master Printers—which, as far as I can judge them from our own figures, are very accurate indeed, and apply with very nearly equal force to this country as to America.

My reason for giving you American figures is that I have no figures available for England except those of my firm, and I do not think it would be desirable to quote figures based on one office, as it might quite legitimately be argued that that office is exceptional. The American figures, on the other hand, consist of averages taken from all the members of the United Typothetæ who make returns, and I understand that nearly every member of the United Typothetæ does make his return regularly.

If I may say so, it seems to me that we have a certain amount to learn in the matter of organisation from the American master printers. The American figures for 1921 show that if 100 represents the cost of production of the product of the trade 35·71 represents the cost of materials, 33·41 represents the cost of wages, and 30·88 represents the cost of the overheads or cost of organisation.

That is as good as saying that one-third of your costs are fixed, and two-thirds only of your costs vary according to the amount of work you have, and of this two-thirds one part is material. From this, it follows that of the various costs making up the hour rates approximately one-half is a fixed amount whether the works are full of work or absolutely idle.

Permanent Organisation.

Now, on consideration, it appears those overhead costs are in direct proportion to the amount of capital you have invested in machinery, because your plant, the amount of machinery you have, governs the size of your *permanent* organisation. If you put down more machinery, you want more room; if you want more room, you have got to pay more rent; you have got to have a large organisation of people; more overseers, more office staff to cope with your busy season. You cannot create an organisation which is capable of coping with the output of ten machines, and run it economically to control the output of five machines, and you cannot improvise this organisation as quickly as you can engage extra hands to work your machine; therefore it has, in practice, *always* to be maintained. That is, it always follows that if one is putting down machinery at all, one has to create the whole organisation if one is to get any work done, and that the whole equipment consists not merely of the machine itself, which is bad enough, but also of the room in which it is placed, the departmental organisation to run it, the office organisation to control that departmental organisation; and if the plant only runs 25 per cent. of its time, the whole of the expense has to be carried by 25 per cent. of the hours of which the plant is capable instead of by the whole lot. This is only another way of saying that over-equipment of plant is always uneconomical.

One of the functions of management is to draw the line between allowing one's factory to be under-equipped and having too much plant; that is to say, between having continual difficulty in setting out work to time and having machines idle for more than a reasonable proportion of their time.

Running Machines at Cost.

In cases of the latter sort, quite a normal result is set forth in the following letter, of which I had a copy sent me by Mr. Williamson. I don't know who it is, so I must apologise if I am treading on anyone's toes. The letter reads:

"If you want to lower your production costs, read this letter; if you do not, don't bother. An up-to-date country printer recently purchased a new machine for a special purpose, which only occupied the machine for two days each week. In order to keep his capital liquid, he is now prepared to run this machine for the remainder of the week at cost only"—I should rather like to ask this printer incidentally what he considers his cost. Is it cost based on a two days' output, or the cost based on the whole output he hopes to get, or the cost based on the whole output that he actually does get eventually? Those three costs give three entirely different figures, and it will produce a very different result to the purchaser of his time.—"The machine is a quad royal with auto feeds, is installed in a first-rate printing works 100 miles from London, two hours by passenger train. A model mono, typo and lino setting equipment is at the works, so that anyone can employ the machine, and the whole is offered to you with country rates of wages at running costs for 3¾ days each week. If this unique offer means anything to you, communicate with me at the above address, and I shall be pleased to call and discuss any further details you may wish."

Lowering Trade Prosperity.

If this offer is made to the trade only, I see no very great objection to the policy of laying down the machine from the general trade's point of view; but if the printer is going further and offering to take work from customers in general at prices equivalent to his suggested rates, the effect, as I understand it, is bound to be this: That printer is short of work; and, looking at things from his own point of view, he is trying to get work to cover his overhead expenses. If even this is not successful, he will try to get work to cover *part* only of his overhead expenses, because he realises that at any rate, for the moment, he will be better off than if he did not keep that machine working.

The result is that the general prosperity of the trade is lowered; the general average value of our product is lowered, because that value is determined by the price at which any given quantity and quality of printing can be purchased on the open market, and every printer suffers in consequence.

Now this is the natural sequence that follows from the initial mistake of putting down machinery which is not required for a reasonable proportion of its time. May I say that we had a very valuable lesson in our own works in the beginning of 1919. We had any amount of work to do, we could get men to work machines, but we could not get machines for love or money, and so we started to work double shifts. Now, although I do not think that double shifts on some classes of work should be anything but an emergency measure, they are a great deal better than putting down new plant which is going to stand idle for a long time. The only effect of that is to create a demand for work which has got to be satisfied, and that is an enormous difficulty for everybody concerned.

As I said at the beginning, it is purely a matter of simple arithmetic. You have only got to calculate out what is the difference between your hour rate when you are working full time, and your hour rate when you are working short time—on the basis that your wages will vary with the number of hours you work, but that the other charges (which are as much as the wages) will not vary whether you work 100 hours a week or 50 or 25 or 10—to find out what sort of an effect it is going to have upon your costs, if you put down plant which is not likely to be used adequately.

Address delivered at Cost Congress in London, May, 1923.

THE CUTTER AND CREASER

Specially designed for the accurate cutting and creasing of carton work at high speed.

SPECIAL FEATURES

Built on similar lines to the Miehle Press, and all the desirable features of the latter, ensuring dead register, smoothness of working, etc., are incorporated in it.

The tympan or cutting plate on the cylinder is held at the front and rear edges by special locating and clamping devices.

The cards are fed to the front lays in the usual manner, and are then taken by the cylinder grippers at the front edge of the tympan plate with a small amount of over-lapping gripper edge.

The cylinder with the card around the tympan plates comes into contact with the forme in the same way as on the two-revolution printing machine.

The card is taken directly off the cylinder by a special gripper delivery mechanism.

Delivery grippers and pads are adjustable.

An endless band travelling at the same surface speed as the cylinder extends from the point of take-off to beyond the point of release of the delivery grippers.

Another endless band on the delivery carriage receives the card from the first endless band.

The card is transferred from the first to the second endless band at the commencement of the outward stroke of the delivery carriage; the second band rolls away from under the card, leaving it to fall directly on to the pile delivery.

The delivered cards are jogged up so that they can be easily stripped.

There are no tapes or sticks in the pile delivery.

From the point of take-off from the cylinder until the card is deposited on the pile it is supported by endless bands.

It is easily handled, and requires no special knowledge on the part of the operator.

This Cutter and Creaser can, if desired, be supplied with a specially designed pile hoist for raising the cards to the feed board.

We have just been passing through a period of very bad trade. We are now, we hope, coming to a period of good and better trade, and if I may presume to advise printers as a whole I should say: Do not incur overhead expenses by putting down and increasing plant immediately the first breath of decent trade comes along. You will thereby only create a source of competition which will render profit making very difficult.

A White Paper Famine.

Col. Lawson's Hint to Publishers.

Col. Lawson, of the *Daily Telegraph*, was surprised during his recent visit to the United States to note much needless waste in newsprint paper by American publishers through practices which he believes might easily be changed.

"You are creating a white paper famine," he told the publishers on the other side. "It isn't a question of sacrificing profits. Your advertising rates are much too low, according to our standards. You should get the same price for a quarter page that you now get for a full page; the advertiser would get the same results and the white paper supply would be conserved. Of course, this couldn't be done unless all the newspapers agreed to it. But the white paper situation is growing serious; newspapers are helping to make it so for themselves as well as for the rest of us. I hope when we get your advertising men to London next year we can show them some vital facts about this that will help in solving the problem."

MR. JAMES FULLAGAR, who started work at Hayle Paper Mill, Maidstone, in 1854, has passed peacefully away at the age of 88. He started to work at Lower Tovil as a boy, drawing a slice, and later at Ivy Mill was engaged on the glazing rolls. He then went as stoker to Hayle Mill, where he put in 60 years.

Norwegian Strike Settled.

Depression in Pulp Prices Follows.

News came to hand from Christiania last week that the strike in the pulp and paper mills has been settled, and work is being started again as soon as possible. We hear that some pulp mills have already got into operation.

Now that the strike is over, the effect on the pulp market is being felt very directly. While the trouble continued prices were maintained, and some consumers exhibited a certain amount of anxiety with regard to their supplies. Now, however, that peace has been restored, depression has overtaken the market.

Practically all brands of pulp have dropped several points during the week. Easy bleaching, for instance, which was selling lately at £17 c.i.f., cannot be disposed of this week for £16 15s. Strong sulphite, again, is offered at considerably less than the £15 to £15 10s. which was was current a week or so ago. Indeed, it is reported that a Swedish mill has been willing to accept £14 10s. Kraft soda pulp is also in a weak condition, and a considerable quantity has been on offer at £14 10s. Mechanical pulp likewise has been feeling the effects of the slump, and instead of selling for £5 15s, there has been some difficulty in obtaining £5 5s.

Rumours are abroad that America has been over-buying to a considerable extent, and is even anxious to cancel contracts entered into.

This fact, if true, together with the restoration of peace in the papermaking industry of Norway, is, to a large extent, accountable for the depression which has overtaken the pulp market.

MR. FRANK R. RINGROSE has severed his connection with Messrs. W. Lunnon and Co., paper merchants and mill agents, 59, Carter-lane, E.C.4, having commenced business on his own account at 16, Laurence Pountney-lane, Cannon-street.

Australian News-Print Market.

Interesting Comparisons of Imports from Various Countries.

During the twelve months ended July, 1922, "news" on rolls was imported into the Australian Commonwealth to the extent of 49,301 tons, of the value of £1,459,684. In the previous twelve months the quantity imported represented 70,454 tons, showing a value of £2,543,660.

The quantity and value of the imports of "news" on rolls from the different importing countries during the twelve months were as follows, the figures in parenthesis representing the imports for the corresponding twelve months of the preceding year: United Kingdom, 7,438 tons, £283,717 (4,825 tons, £276,954); Canada, 25,056 tons, £662,268 (29,409 tons, £938,236); Finland, 216 tons, £10,633 (383 tons, £11,463); Japan, 75 tons, £2,959 (507 tons, £14,546); Netherlands, 348 tons, £8,474 (2,690 tons, £121,916); Norway, 8,240 tons, £212,955 (11,204 tons, £378,243); Sweden, 7,825 tons, £274,494 (20,877 tons, £773,838); United States, 103 tons, £4,184 (559 tons, £27,851).

The receipts of the different importing States are shown as follows, with the previous year's figures in parenthesis: New South Wales, 20,442 tons, £647,536 (33,457 tons, £1,123,098); Victoria, 17,465 tons, £532,483 (22,919 tons, $889,509); Queensland, 4,359 tons, £121,112 (5,230 tons, £189,613); South Australia, 3,531 tons, £96,194 (5,681 tons, £207,545); Western Australia, 2,269 tons, £56,353 (2,664 tons, £113,633); Tasmania, 235 tons, £6,006 (503 tons, £19,662).

THE number of persons on July 2nd recorded on the live registers of the employment exchanges in Great Britain as wholly unemployed was 1,191,400. This was 2,341 more than in the preceding week, but 294,478 less than on January 1st, 1923. The number working short time and drawing benefit for intervals of unemployment was 63,000 on July 2nd, as compared with 60,177 on June 25th and 56,261 on January 1st, 1923.

Trade Notes.

PARTNERSHIP has been dissolved between W. A. Palmer and T. K. Rudkin, printers and stationers, 51, Granby-street, Leicester, under the style of W. A. Palmer and Co.

A FIRE in Upper Thames-street on Friday damaged the premises occupied by Messrs. D. W. Searle and Sons, Ltd., printers.

DUBLIN PRINTERS' NEW PREMISES.—Particulars published by Messrs. Cahill and Co., Limited, of their newly constructed premises, state that the work has been carried out by Messrs. J. and R. Thompson (Dublin) to the plans of Messrs. O'Callaghan and Webb (Dublin). The premises cover three acres, and the plant and equipment is said to be the last word in modern printing methods, being provided by the best manufacturers in England, Germany and America. There are two rotary presses, driven by electric motors, while the large flat bed machines are driven by chains from motors. The rotary machine is by Kœnig and Bauer, and the electrical equipment by Mr. A. G. Bruty, Dublin.

JUDGMENT was given for plaintiff with £160 damages and costs when at Durham Assizes last week Dr. Selby Wetherell Plummer, medical referee under the Workmen's Compensation Act, brought an action for libel against five officials of the Houghton Lodge of the Durham Miners' Association and against P. H. Veitch and Son, printers.

IN a case against the editors and owners of the *Drapers' Record and Men's Wear*, the Court, consisting of Justices Darling, Salter and Swift, made an order on Monday that there had been contempt, and for the payment of costs. The contempt alleged was in connection with the reporting of certain criminal proceedings against two men named Kutas and Jerichower, in which a "regrettable but honest mistake" was made by the reporter.

THE trial lasted seven days at Glasgow High Court in the case in which Lindsay Steven Carstairs and Hugh Henderson were charged with fraud and attempted fraud while professing to act as partner of and as a manager and buyer for David Carstairs and Son, wholesale stationers, etc., Dunlop-street, Glasgow. Carstairs was sentenced to four years penal servitude, Henderson being found not guilty and discharged.

THE Court of Session has fixed a date for the trial of an action at the instance of James Lang, 23, Balfour-street, Port-Glasgow, against George Outram and Co., Ltd., proprietors of the *Evening Times*, Glasgow, for payment of £500 as damages for alleged slander. The pursuer, a Parish Councillor of Port-Glasgow, complained of a paragraph published by the *Evening Times* newspaper of 8th September, 1922, in which he was described as a "recognised leader of law-breakers." The defenders contended that the paragraph referred only to the pursuer's arrest as one of those who were alleged by the authorities to be criminally answerable for the mobbing and rioting which admittedly took place in Port-Glasgow on 4th September. The Judge thought that was quite a passable construction of the language, but, in his opinion, it was not the only construction.

AT last Thursday's meeting of the Council of the London Master Printers' Association, topics discussed covered several matters broached at the annual meeting of the Association, including the question of the contribution of the L.M.P.A. to the Federation of Master Printers, and the suggested inauguration of a guarantee fund to meet occasional losses incurred by members. Full consideration was given to the position arising out of the recent conference between the London Society of Compositors and the Association in regard to linotype and monotype piece scales, particularly in view of the Society's desire to introduce compulsion in applying the scales to certain houses, in spite of the fact that the monotype piece scale received L.M.P.A. approval subject to its being entirely voluntary in its application.

THE project of what would doubtless have proved an interesting conference between the London Master Printers' Association Costing Committee and the L.S.C. Jobbing Guild has, unfortunately, not matured. The meeting, which was to have been held yesterday (Wednesday), has been postponed at the request of the Society.

COVENTRY Master Printers' Association held its annual dinner on Monday, under the presidency of Mr. A. E. Feltham. Amongst those present were Messrs. E. W. Silk and D. R. King, for the Midland Alliance, and Mr. A. E. Goodwin, for Federation headquarters. An interesting point mentioned by Mr. Goodwin was the fact that Coventry holds the record of having a membership of master printers, 100 per cent. of whom are working the Federation Costing System.

AT a recent meeting of the Joint Industrial Council of the Printing and Allied Trades, suggestions were made for clearing off an overdraft in connection with the fund instituted by the Printers' Pension Corporation in 1918, to assist children of printers who were killed in the Great War. At the present time 1,200 orphans are receiving weekly grants to the total of £10,000 per annum.

AT the final meeting of the annual conference of the National Association for the Prevention of Tuberculosis at Birmingham last week, Mr. George A. Isaacs, general secretary of the National Society of Operative Printers and Assistants, said it was now generally accepted that the prevalence of tuberculosis was relatively higher in the printing trades than any other. Some authorities believed the presence of lead in this industry to be an important factor in the causation of the disease in Great Britain. The matter was being seriously considered by the Joint Industrial Council of the Printing Industry and by the London newspaper proprietors.

THE annual outing of the Bookbinders' Pensioners is to take place on Saturday, August 18th. All those interested in the work carried on by this capital institution are invited to participate in the enjoyment to be given to the old folks. Further information can be obtained from the hon. secretary, at 34, Kennington-road, S.E.1.

MANY specimens of books printed before 1800, including a number produced by Wm. Caxton, were exhibited in Sion College, London, at the annual reception, by the President and Court of Governors. The exhibits also included Coverdale's Bible (1535) (the first printed in English), the first edition of the Book of Common Prayer (1549), and the Book of Solemn Prayer (1552).

THE thirty-six holes final of the London Press Golfing Society's match-play foursome tournament for the challenge shield and mementos presented by Sir George Sutton, was decided at Coombe Hill, on Thursday, when S. J. Southerton (4) and W. A. Greaves (18), representing the Cricket Reporting Agency, beat Guy L'Estrange (scratch) and Stanley Jay (10), of the Central Press, by 3 and 1.

MR. VALENTINE KNAPP, treasurer, and for three years president of the Newspaper Society, described the attitude of the provincial associations regarding Divorce Court reports, at a further sitting of the Select Committee which is considering the whole question. They had, he said, decided to consider co-operation with kindred bodies and in news agencies. It was considered that the Bill was too restrictive, although he was of opinion that there was a law which should be put into operation to exclude some matters which might be regarded as offensive, and if necessary the law should be strengthened. Mr. Knapp during his evidence stated that he was representing the views of a joint committee of the Newspaper Society, the Scottish Daily Newspaper Society, and the London News Agencies.

ALDERMAN DAVID JAMES DAVIES, ex-Mayor Llanelly, who has died in his 56th year, had been editor of the *South Wales Press* from 1892, and for many years was managing director of Messrs. James Davies and Co., printers and publishers, Llanelly.

NEWSPAPERDOM was largely represented at the funeral of Lady Starmer, wife of Sir Charles Starmer, managing director of the *Westminster Gazette*, at Darlington on Saturday.

WILLS.—The late Mr. Benjamin Chaffers Roberts, J.P., Chester, chairman of the *Cheshire Observer* Company, Limited, left unsettled estate of the gross value of £47,383, with net personalty £45,840. The late Mr. Frank Stephenson (67), late senior partner in A. White and Co., printers, publishers, and stationers, Hill-street, Finsbury-square (net personalty £25,525), gross value £25,618. The late Thomas Dick Morrison, retired publisher, Glasgow, left personal estate, gross £12,291.

THE late Rev. Dr. Sir William Robertson Nicoll, for many years editor of the *British Weekly*, widely known under his pen-name, "Claudius Clear," left unsettled property in his own disposition of the gross value of £52,757.

AT the half-yearly meeting of the shareholders of the Bury Papermaking Co., Ltd., in Bury, Mr. James Preston presiding, the report was adopted, Mr. Preston was re-elected a director, and Messrs. C. M. Merchant and Son were appointed auditors.

DR. JOSE CARLOS RODRIGUES, the Brazilian journalist, has died in Paris, aged 80.

WE have received from Messrs. William J. Light and Co., Ltd., of 36-38, Whitefriars-street, E.C.4, a most attractive sample book of rubber blankets and tympan sheetings. This enterprising firm are well-known for the quality of their products, and the sample book under review is a most useful and forceful demonstration of the fact. The range offered is a unique one, and the book should be found a forceful selling agent.

MESSRS. JOHN KIDD AND CO., LTD., send us a print of the new gold and silver inks manufactured by them, which have just been placed on the market. These inks are claimed to be unique, and unlike any others on the market, inasmuch as perfectly brilliant results can be obtained with one impression only on any type of letterpress machine running at a normal speed, and the inks dry on the surface of the paper in 24 hours, so that they cannot be rubbed off, but can be handled or folded without any trouble whatever. Moreover, they do not fill up, and very fine type can be printed with as good results as heavy solids. Messrs. Kidd supply the powder and the varnish in separate containers, which enables the machine operator to mix it as required with a palette knife on the slab, or even in the ink duct itself, to whatever consistency is required to suit the particular job on hand.

MANY useful properties are claimed by Messrs. W. H. Maguire and Son, of 20, Dale-street, Hulme, Manchester, for their product "Soaplah." It is stated that "Soaplah" will make an ink distribute perfectly on the machine and a much less quantity is required than in the case of ordinary reducers. The pigment and vehicle of the ink are not separated and "Soaplah" causes the most difficult ink to run quite clean, in fact good quality inks will often run all day on half-tone work without the plates requiring to be brushed out. The effect of "Soaplah" is to clean the forme as the run proceeds instead of allowing gradual accumulation of ink. To achieve dryness without sticking and run at 3,000 impressions per hour with pile delivery and avoid set-off is stated to be possible to any pressman with discernment by the aid of "Soaplah."

WE have received from Messrs. William Sessions, Ltd., the Ebor Press, York, a copy of the second issue of "The Estimator," a careful revision having been made by the author, Mr. E. Jackson. A considerable amount of additional matter has been included in this issue. This handy little compendium is divided into four parts, which deal respectively with costs of various operations, selling prices of small work and litho costs and selling tables, selling prices of booklets, etc., and net costs of blocks, etc. The work, which is tastefully bound, is most comprehensively indexed, and should be found invaluable in estimating. The saving of time which its use ensures is obvious. The published price is 10s. 6d., post free, in cloth.

Large Stocks always on hand for Immediate Delivery.

Printers' Bowling Competition.

Employers and Workers Meet.

An interesting departure was made in connection with the East Anglian Alliance of the Federation of Master Printers on Saturday last, when Mr. H. Hanson, the new president of the Alliance, arranged a bowling competition open to employers and employees from the different printing centres comprised in the Alliance. Seven teams entered, namely, Norwich, Ipswich, Cambridge, Bungay, Beccles, Colchester and Fakenham—the Fakenham representatives, however, failing to put in an appearance. The competition took place on the grounds of Messrs. W. S. Cowell, Ltd., Ipswich, which firm also entertained the competitors and visitors to an excellent tea.

After the repast Mr. Hanson explained his purpose in getting together employers and employed on a common meeting ground, and said he hoped the experiment would be followed elsewhere.

Col. H. Rivers Fletcher, president of the Federation, expressed warm appreciation of Mr. Hanson's generosity, and thanked him for presenting the handsome silver cup for the competition. He remarked upon the excellent relationship between employers and employed in the printing industry, there being a notable absence of bitterness. He said he hoped that there would be a larger number of district committees formed in the East Anglian area, and paid a tribute to the work of those already existing.

Mr. A. E. Goodwin, speaking as joint secretary of the Joint Industrial Council, said that there were probably more topics on which employers and employees were in agreement than questions on which they differed, and it was of great importance that every effort to emphasise points of agreement should be encouraged. He referred to the recent international conference of printers in Sweden as an instance of how representatives of different nationalities, holding entirely different views on international topics, could yet meet in friendly conference on all questions relating to the printing industry. He spoke of the valuable work done in Norwich, Cambridge and Colchester in connection with technical education, and hoped that Ipswich would revive its district committee and take up this work in earnest.

Mr. Rushton, of the Art School, Ipswich, also spoke on the need for greater interest to be taken in technical education.

The Mayor of Ipswich was present, and expressed his pleasure at taking part in such an interesting gathering, and Mr. Ganzoni, M.P. for Ipswich, also spoke.

The result of the competition was a tie between Norwich and Beccles, there being a very keen struggle and excellent scores being made by the other teams.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

CANADA.

A Canadian manufacturing company who are grinders of engravers' copper and zinc plates, being in a position to fill export orders, are desirous of hearing from British importers.

NETHERLANDS.

An agent in Amsterdam desires to secure the representation for the Netherlands of British manufacturers of bookbinders' calico, leather-cloth, artificial leather, etc. (Reference No. 44.)

IN consequence of an article in the *Nepszava*, by the former Commander-in-Chief of the Hungarian Red Army, Boehm, the Government suspended the paper for one week. All the printing operatives and compositors accordingly struck, and no papers appeared in Budapesth on the 13th inst. Upon the Socialist Deputies' official disapproval of the offending article, however, the paper again appeared, and the strike was ended.

Poisoning Mystery.

An inquest was held at Southwark on Saturday on the body of Ernest George Wright (27), labourer, of Zoar-street, S.E., who had been employed at Messrs. Fry's Metal Foundry, Holland-street, Southwark, and who died in Guy's Hospital on Thursday.

The man's mother stated that when her son came home on the previous Tuesday morning he was very yellow and was scarcely able to stand, and was sent to the hospital. He told her that the rain had got on some sacks in the foundry and caused fumes.

Dr. Thomas Rose, police divisional surgeon, thought the condition was due to poisoning by arseniuretted hydrogen.

Mr. Alfred Munday, chief metallurgist and London manager at Fry's Metal Foundry, Holland-street, Southwark, said they had bags containing printers' dross consisting of 85 per cent. of actual metal, not oxides, the remainder being oxide, *plus* any sweepings from the printers' shops, dust, etc. This was put into a furnace of 850 degs. C. and was run out into a vessel, after which it was put into bags for making small castings, not type. He did not think they could get any metal that was absolutely free from arsenic. During the storm a great quantity of water got into the foundry. Wright was probably helping the other men to put the material in bags. During the three years in which the witness had been manager the foundry had had no cases of poisoning. The employees were provided with toothbrushes, respirators, and a shower bath. The passage that was flooded contained bags of residues. Only a few of the compounds would be acted on by water. Arseniuretted hydrogen was not evolved without the presence of an acid. He could not account for the arsenic being evolved if it caused Wright's death.

The inquest was adjourned for an analysis.

Paper Enterprises in India.

(From Our Bombay Correspondent.)

AFTER many delays the Carnatic Paper Mills, Ltd., is likely to commence production in July. The mills are located at Rajahmundry, on the Godavari River to the north of Madras, in a district in which large quantities of bamboos and rice straw are available. It is a deltaic country, with many interconnecting canals, and consequently the transport of the raw materials to the mill should be extraordinarily cheap. The output is estimated at ten tons of dry pulp and five tons of paper per day during the first year; but it is anticipated that these quantities will be substantially increased later on. The capital of the company is 30 lakhs of rupees, equivalent to approximately £200,000.

A SCHEME is afoot for the erection of a paper mill at Cuttack, a town on the Bengal-Nagpur Railway, about 230 miles south-west of Calcutta. The raw material will come from the immense bamboo forests in the Angul district, about 70 miles away, and it is estimated that at least 70,000 tons, and perhaps 100,000 tons, can be made available per annum at a cost, delivered at mill, of £1 per ton exclusive of royalty. A detailed scheme is being prepared by Mr. Raitt, Paper Expert to the Government of India.

ANOTHER project which promises well is situated in West Khandesh, north of Bombay, in the neighbourhood of the Tapti River. A Bombay financial group is interested in the scheme, but beyond the fact that it is proposed to utilise grasses it is impossible to extract any information. It is known, however, that the Bombay Forest Department is in sympathy with the proposal; also that a definite application for a concession has been made to the Government of Bombay.

MR. H. MURRAY MEEK and Mr. Percy C. Skelton, both of whom have had valuable experience in the paper trade, have started up in business on their own account, under the style of Meek and Skelton, paper agents and merchants, at 168, St. John-street, Clerkenwell, E.C.1 ('Phone, Clerkenwell 6575). Both Mr. Meek and Mr. Skelton were formerly with Messrs. Spalding and Hodge.

Trade Union Matters.

TYPOGRAPHICAL ASSOCIATION REPORT.—The 147th half-yearly report of the Typographical Association, now issued, covers the period from June 26th to December 30th, 1922, and consequently the serious stoppage of work of last August. The stoppage had a drastic effect on the Association finances, there being a loss on the half-year of no less than £46,401 on the general fund and a net loss of £42,560 on the combined general and superannuation funds. Strike payments amounted to £69.359, towards which the levy on those members remaining at work amounted to £22,280. Out-of-work payments totalled £29,101, and unemployment payments £20,331, the total payments, including superannuation, reaching £141,969, an increase of £73,490 on the half-year. Disbursements for superannuation totalled £74,987, an increase of £3,840. The general fund of the Association at December 30th stood at £28,938, against £75,340 in the previous half-year, and the superannuation fund at £74,987, against £71,147, the combined total of £103,926 comparing with £146,487. Fully employed members number 23,159, a decrease of 405; casually employed 3,165, an increase of 289; apprentice members £1,561, and honorary members £1,853, the total membership of 30,716 showing a decline of 175 on the half-year.

CONFERENCE FOR NEWS WORKERS.—We are informed that the paragraph we published last week with reference to a purported meeting in London between the National News and Operators Guild and representatives of the Newspaper Society is entirely inaccurate. The meeting, which is taking place on July 17th, and to which, no doubt, our correspondent intended to refer, is a meeting of the Joint Committee set up under the National Agreement between the T.A. and the employers' organisations (the Federation of Master Printers and the Newspaper Society). The conference in question is to consider certain requests which the T.A. has made to the employers for amendments to those of their rules to which the employers are consenting parties, usually referred to as the agreed rules.

THE PRINTERS OF CHIAPOLIS, by R. T. Porte. Salt Lake City, Utah: Porte Publishing Company.

Well worth reading is this little volume of short stories for printers, most of them reprinted from the *Inland Printer*, our American contemporary. Each story has a moral to point or a lesson to teach, and the facts are often driven home in a manner both forceful and amusing. This 156 page volume, 7¾ ins. by 4¾ ins, is illustrated by clever black and white drawings, and is handsomely bound in imitation leather boards. The price is $3.00

"THE TECHNOLOGY AND PRACTICE OF PAPER-MAKING," a complete text and handbook of the entire pulp manufacture. Edited by Prof. Dr. E. Heuser, of Darmstadt. Vol. II. "The Production of Cellulose from Wood —Sulphite Pulp," by Richard Dieckmann. 367 pages with 365 illustrations and two mill plans, bound in half linen. Published by Otto Elsner, Verlagsgesellschaft m.b.H., Berlin. Price 20s.

This is the second volume of a collection of technical works edited by Dr. Heuser under the title of "Technik und Praxis der Papierfabrikation." It is from the pen of the mill director, R. Dieckmann, and is entitled "Die Fabrikation des Zellstoffes aus Holz, Sulfitzellstoff," and deals exclusively with the manufacture of this product.

No such complete work has appeared since Prof. Kirchner issued the third part of his "Technology," and the present work performs a valuable service in bringing the subject up to date. As the author points out, this industry has experienced extraordinarily rapid development on the technical side in the last fifteen years.

The work is arranged in a methodical manner, the processes being fully described in a thoroughly practical way in their natural sequence. After an interesting and accurate history of the discovery and working out of the processes leading finally to the standardised forms bearing the names of Mitscherlich and Ritter-Kellner, the author deals very fully with the water supply necessary to such an industry, and then in considerable detail with the kinds of wood employed, their habitat, growth, diseases and insect pests, showing their effect on the finished product. The felling, transport and handling into the mill are all detailed. Then follow chapters on every single step in the manafacture—sawing, debarking, chipping, extraction of knots, dust, etc., the preparation of the digesting liquors, from sulphur, pyrites, etc., and lime, magnesia, etc., and the various burners and absorption apparatus.

After a careful and practical account of the digestion process and the methods of purifying the resulting pulp, there is an important chapter on the recovery of by-products wherein the work of Wallin, Ekstrom, Rinman and others is well described.

The closing chapter is devoted to a description of the methods of chemical analysis and control, and, finally, short notes are added to chapters 3 and 4, bringing their information quite up to date.

The illustrations are clear and helpful, and he work will rank as a standard book of eference.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

THE following MACHINES, which are in good working order, are FOR DISPOSAL, and may be viewed by appointment:—

One Section Folding Machine, by Salmon. Folds one to twelve sheets up to 35½ in. by 27½ in. in one or two parallel folds.

One Seybould 18 in. by 12 in. Duplex Self-Clamp Book-Trimming Guillotine, with reversible table.

One Brehmer 12 in. End Sheet Pasting and Tipping-on Machine.

One No. 4 Smyth-Horne Power Book Sewing Machine.

Apply for any further information to Chorley and Pickersgill, Ltd., the Electric Press, Leeds. 14204

American News-Print.

May Production Figures.

The 49 reporting companies produced 232,085 tons and shipped 230,503 tons during May. Production exceeded shipments by 1,582 tons. Production figures include 1,092 tons of hanging, of which 649 tons were made in Canada.

The average daily production of news-print paper by mills reporting for May amounted to 101·0 per cent. of the average daily output during the three months of greatest production in 1922, with allowances for changes in machines.

Comparing production during the first five months of 1923 with that of the same period of 1922, the United States companies reporting show an increase of 65,178 tons, or 13 per cent., the Canadian companies an increase of 85,169 tons, or 20 per cent., and the total of all the companies reporting shows an increase of 150,347 tons, or 16 per cent.

Stocks during May increased 14 tons at mill points in the United States and 1,140 tons in Canada. Total stocks of all reporting mills amounted to 29,552 tons, or 1,154 tons more on May 31st than on April 30th. These stocks were equivalent to 3·5 days' average production, about 25 per cent. of which was at British Columbia mills that ship by water.

Canadian Exports.

A special report issued by the Canadian Pulp and Paper Association states that the exports of news-print for the month of May amounted to 98,901 tons, compared with 78,378 tons in the previous month. While this figure does not constitute a new record, it is the highest yet recorded, with the exception of the month of March, when the total exports were 113,450 tons.

Of the 98,901 tons exported in May, 98,531 tons were sent to the United States and only 370 tons to other countries, New Zealand taking 343 tons of this amount.

The first five months of this year have witnessed a large increase in our news print exports over the corresponding period of the last two years. The following figures are for the five months of the years specified: 1923, 457,913 tons; 1922, 370,861 tons; 1921, 277,571 tons.

This year's figures show an increase over last year of 87,052 tons, or 23 per cent., and over 1921 of 180,342 tons, or 65 per cent.

Of the total exports in the five months' period the quantities shipped to the United States were as follows:—1923, 446,713 tons; 1922, 345,647 tons; 1921, 252,794 tons.

Shipments to countries other than the United States were much smaller in proportion to the total this year than in either 1922 or 1921.

IMPORTS of news-print paper into the United States represented 2·3 per cent. of the total imports, wood pulp representing 2·0 per cent.

WHEN a man is worrying, he is not working. When he is working, he will have little time to worry.

United States—LOCKWOOD TRADE JOURNAL Co., 10 East 39th-street, New York.
Representatives also in Australia, India, South Africa, Canada, etc.

THURSDAY, JULY 19, 1923.

The International Spirit.

ONE sees many welcome signs nowadays that British printers, and printers in other countries also, are beginning to break away from the limits of nationalism in their trade outlook and are taking a wider view of the progress and problems of the printing and allied trades. The several overseas visitors who attended the recent annual gatherings of the Federation of Master Printers of Great Britain and Ireland both gave and received pleasure and profit by rubbing shoulders with printers of another country, and the same experience fell to the lot of the printers who voyaged overseas from this and other lands to attend the recent international congress of master printers at Gothenburg. Between us and the United States of America, particularly, happy trade relationships are continually extending, and the bond of union is strengthened by the stream of individual printer visitors passing between the two countries. It is with special pleasure that we mention in another column this week the expected journey of three prominent representatives of the British printing industry to attend the October convention of the United Typothetæ. Both the private printer and the trade organisation stand to gain by strengthening the bonds of international fellowship and by comparing the views, methods and apparatus of home printers with those of printers overseas.

Paper for Offset Printing.

ANTIQUE deckled edge bookpaper scored a success in the recent production of a wonderful volume executed by the offset process throughout, including type matter, photographs, crayon drawings and sketches. There is a wide field for exploitation of offset work as applied to artistic printing on uncoated paper, and high class antique printing paper will play a very prominent part in this forthcoming development. There is no reason to fear that coated art papers will suffer from encroachment. Rather it is a case of creating a new sphere of paper consumption.

Prices of Boards.

STRAWBOARDS are easing down progressively, and we hear of one Dutch mill anxious to book business at low figures owing to very ample stocks of raw material. Agents' quotations on this side are in the region of £9 5s. per ton for unlined boards up to 1½ lbs., for which substance and heavier an extra charge of £1 5s. per ton is made. Norwegian glazed leather boards are listed at £19 per ton for first grade, £18 per ton second grade. White wood pulp boards have a very firm market at £20 per ton for 600's, £19 per ton for 450's and £18 per ton for 60's to 350's. English boxboards are steady at prices which work out favourably against imported boards when superior substance is taken into account. The white lined boards have recently been improved in colour and finish.

Some Paper Prices.

FOR making orders the following prices are at present being quoted: Pure esparto writings, 3¾d. to 4d. per lb.; esparto printings, 3½d. lb.; M F. printings, first grade, 3¼d. lb., second grade 3⅛d. lb., third grade 3d. lb.; pure S.C. printing, 3⅛d. lb.; imitation art, first quality 3½d. lb., second quality 3¼d. lb.; M.G. white poster, pure, 3⅜d. lb.; white bank, 3¾d. lb.; glazed imitation parchment, 3⅜d. lb.; tinted printings, 3¾d. lb.; tinted imitation arts, 4d. lb.; glazed coloured printings, fine quality, 3½d. lb.; coated white art, 5½d. to 6½d. lb.

Paper Export Falling Off.

THERE is a good deal of grumbling among paper people at the slowness of business Unfortunately, this has extended to export, which for some time has been the saving grace of the whole paper situation. It is difficult to account for the vagaries of the market in these times. Adverse influences arise in a curious way nowadays, and they are not all attributable to the political upheaval in Central Europe. Papermakers feel the effect of the adverse conditions without knowing how they arise or how to meet them. Commerce is an exceedingly difficult proposition at the moment, and set-backs arise continually in unexpected places. The Australian market, for example, which might be expected to remain fairly stable in view of the British preference, has fallen off. Newsprint, of course, is still in a healthy condition. It is printings and writings which are now feeling the effect of depression. Wrappings have done so for long enough, and there is no improvement in this direction so far. Complaints are still made of price competition. Even the declaration of the Norwegian strike has failed to give that strength to this aspect of business which was expected. The customary summer quietude appears to be settling on business, and perhaps this is the cause of the gloomy view to which expression is now given.

Attraction of Latex Paper.

RARELY has the introduction of any auxiliary for use in the manufacture of a staple product caught the popular imagination more than that of rubber latex in paper using circles. Of course, it may be due to well-conceived publicity rather than to any fortuitous circumstance; but the fact remains that people who had never before considered paper as anything but a product made from rags or wood are now conceiving it to be a revolutionised commodity with indiarubber as a main constituent of its composition. It may be difficult to correct the mis-conception in some cases, simply because there is less interest in understanding a thing thoroughly than in absorbing an idea superficially.

Personal.

VISCOUNT BURNHAM was elected to preside at the fifth annual conference of the Association of Education in Industry and Commerce, which was held from Wednesday to Friday of last week in the Memorial Hall, Farringdon-street.

ALDERMAN SIR MEREDITH WHITTAKER, J.P., who was last week presented with his portrait by the Linotype Users' Association, of which he is president, has given the painting to the Corporation of Scarborough.

IT is expected that Lieut.-Colonel H. Rivers-Fletcher, president of the Federation of Master Printers; Mr. W. B. Wykes, vice-president, and Mr. A. E. Goodwin, secretary, will attend the convention of the United Typothetæ, the organisation of printing employers in the United States, which is to be held at Washington next October.

ALDERMAN SIR GEORGE TRUSCOTT, BT., Deputy Master (the permanent Master being the Duke of Connaught), presided at a meeting of the Royal Colonial Institute Lodge of Freemasons on Wednesday of last week.

MR. W. J. D. ROBERTS, of Messrs. W. J. Pollock and Co., Ltd., printers, was installed Worshipful Master of the Helio Lodge of Freemasons on Tuesday evening, and Mr. R. Hume (Hudson and Kearns), was appointed S.W.

MR. EDWARD P. VACHER has been elected Master of the Worshipful Company of Stationers, with Mr. Richard Bentley as Upper Warden and Fred H. Miles as Under Warden

SIR FREDK. BECKER proposes to leave for America at the end of this month.

MR. A. CHADWELL, past president of the Electrotypers and Stereotypers Managers' and Overseers' Association, manager of the foundry of the United Newspapers, Ltd., who has been seriously ill, is reported to be well on the way to convalescence.

MR. D. H. I. POWELL, news editor of the *Cambria Daily Leader*, has been married at Swansea to Miss May Thomas, an ex-member of the staff of that paper.

MR. THOMAS MCMULLAN, of the literary staff of the *Belfast Telegraph*, has been presented with an oak sideboard by his colleagues on the occasion of his marriage, the presentation being made by Sir Robert Baird, the proprietor.

MR. E. M. TULL, of the *Reading Mercury*, has been presented by the directors with a gold watch on the occasion of the bi-centenary of that journal.

MR. E. E. MOORE, of Messrs. Moore and Dewdney, wholesale stationers, London, was selected by the English Bowling Association to captain the English team in the international games played at Croydon on July 11, 12 and 13.

MR. NORMAN HARRIS, of the *Herald* office, Port Elizabeth, South Africa, is on a visit to this country, his headquarters being John Henry and Co., 6, Ludgate-square, London, E.C.

IT is stated that a reorganisation of the management of the British Empire Exhibition is taking place, and that in future Mr. U. F. Wintour, who has been the general manager of the Exhibition, will act as adviser and consultant to the board.

MR. BARRINGTON HOOPER, C.B.E., has been appointed Controller of Publicity to the Exhibition, in succession to Mr. W. S. Crawford, who was compelled to resign owing to the increasing call on his time by his own business.

SOME three tons of worn out Treasury notes are taken out of circulation every month and repulped.

A Notable Fancy Dress.

The Linotype Prize-Winner.

We are able to reproduce herewith a photograph showing the striking fancy dress which carried off the first prize in the Fancy Dress Competition for technical representations of the printing and allied trades at the dance in connection with the L.S.C. Jubilee Celebrations at the Crystal Palace last week.

The lady is Miss Elliott, of Messrs. Linotype and Machinery Limited, and her costume, it will be noted, includes representations of numerous salient features of the Linotype machine.

Photo: Davey and Hackney, Wood Green.

"The Linotype."

This is, so far as we know, the first occasion on which a composing machine has been chosen as inspiration for a fancy dress design, and special interest therefore attaches to the fact that Miss Elliott achieved the distinction of winning the first prize.

Papermakers' Directory.

The Papermakers' Directory of All Nations for 1923 is published by Messrs. Dean and Son, Ltd., 29, King street, Covent-garden, W.C.2., price 21s. net. In its familiar red cover, the directory runs to 971 pages, LVI. In these days of constant changes, it is a little difficult to keep books of reference of this character up to date, but the editor of this particular work has done exceedingly well. A guide to the principal paper, pulp and board mills of the world, the several countries are classified alphabetically following those of the United Kingdom, the alphabetical system being also adopted in relation to each section. The directory also specifies the wholesale stationers, paper merchants, paper, pulp and board agents, paper bag makers, the principal cardboard and paper box manufacturers and waste paper merchants and paper stock dealers in this country. A useful section of the work is devoted to mill productions, the mills being classified according to the principal grades produced and being arranged alphabetically according to country. The Directory is a particularly easy volume to consult for the reason that it is arranged alphabetically in three main sections. The whole work forms a most useful publication for all who are interested in paper and those who handle it.

Technical Examination Successes.

A long list of prize-winners and successful candidates in the technical examinations of the Stationers' Company and Printing Industry has now been issued.

In composing, the first prize, £3 3s. and silver medal, goes to W. E. Thirkettle; the second prize, £2 2s. and silver medal, to C. D. W. Palmer, and the third prize, £1 1s., to F. C. Errington. The first prize, £3 3s. and silver medal, in the machine course is carried off by N. Wills, the second prize, £2 2s. and silver medal by F. E. Stean, and the third prize, £1 1s., by C. W. Lockyer. In lithography, T. A. Miller takes the first prize, £2 2s. and silver medal, whilst E. Horne and J. G. Shedden tie for second prize, silver medal, they having obtained an equal number of marks. In binding (senior), the first prize, £1 1s., is taken by A. V. Vernum, A. E. Warren taking the second prize, 10s. 6d. In binding (junior), the first prize, £2 2s. and silver medal, goes to H. W. Collins, the second prize, £1 1s. and silver medal, going to J. W. Garnham. In the warehouse course, N. B. Fry takes the first prize, £1 1s., and H. Stone the second, 10s. 6d. In the course for order clerks, the first prize, £2 2s. is won by T. Lowe, the second prize, £1 1s. by H. A. Rose, whilst F. W. Goldsmith and T. E. Whittham tie for third prize, 10s. 6d., both obtaining an equal number of marks. The first prize, £2 2s. in estimating (winter term) is gained by E. R. Stockley and the second prize, £1 1s., by R. G. Allen; the first prize, £2 2s. (spring term) goes to W. G. Eldridge, and the second prize, £1 1s., to F. E. Godfrey. In costing (winter term), the first prize, £2 2s, is won by A. P. Pritchard, and the second prize, £1 1s., by G. A. Hughes; (spring term), first prize, £2 2s., Miss E. White, T. Lowe and T. A. Hickmore tying for second prize, with an equal number of marks; (summer term), first prize, £2 2s, Miss G. Thompson, second prize, £1 1s., A. H. Simmons. In paper, C. W. James takes the first prize, £1 1s., and T. Lowe the second, 10s. 6d. In the course for printers' assistants, the first prize, £1 1s., goes to A. Moore, and the second, 10s. 6d., to G. Trenter. In stereo and electro (senior), P. Bygrave takes the first prize, £1 1s.; (junior), A. G. Allen, first prize, £1 1s., B. W. Wood, second prize, 10s. 6d. In reading, the first prize, £1 1s., was won by H. C. Harrison.

Developing Trade with India.

Extending Trade Commissioner Service

In connection with the scheme for strengthening the Trade Commissioner Service as a means of promoting the development and expansion of inter-Imperial trade, it has been decided to establish a new Trade Commissioner post at Bombay, and to appoint a second Trade Commissioner at Calcutta to assist the Senior Trade Commissioner there.

The Bombay post, which it is hoped to open in October next, will be occupied by Major R. W. Clarke, who has been appointed H.M. Trade Commissioner and is at present serving at the Department of Overseas Trade. The Calcutta post referred to has been filled by the appintment of Mr. W. D. Montgomery Clarke,

Paper in India.

In a survey of the industries of the country, *Industrial India* observes: The paper industry presents excellent prospects for development. The annual consumption of paper and pasteboard amounts to over 75,000 tons, but at present two-thirds of this quantity is imported. There is no reason why this state of affairs should continue. The forest areas contain enormous supplies of bamboo and elephant grass, which could be utilised for the manufacture of all the paper and pastel board required for local needs.

A GENTLEMAN from Melbourne desires to purchase carton box manufacturing machinery and packing plant. British manufacturers of the types of machinery mentioned should communicate with the Official Secretary, Commercial Branch, Australia House, quoting Reference No. 412/7/1/1/138.

DIVIDENDS AND REPORTS.

GEORGE OUTRAM AND CO. have declared interim dividend of 1s. per share, less tax.

YORKSHIRE LIBERAL NEWSPAPER AND PUBLISHING.—Further divided of 7½ per cent. on ordinary shares, making 15 per cent., less tax together with bonus of 10 per cent., free of tax, carrying forward £7,812.

ST. MAURICE PAPER CO., LTD.—Quarterly dividend of 1½ per cent.

NEW COMPANIES.

JOHNSON, POORE AND CO., LTD.—Capital £1,000, in £1 shares; manufacturers of, and wholesale and retail dealers in office, shop, and household furniture of all kinds, stationers, printers, bookbinders, booksellers, etc. Private company. First directors: J. O. Johnson and A. J. Poore. Registered office: 17, Seaton-street, Hampstead-road, N.W.1.

HENRY ELWIN, LTD.—Capital £20,000, in £1 shares (10,000 ordinary and 10,000 preference); to take over the business of a printer, stationer, box manufacturer and paper merchant carried on by Henry Elwin at Plumptre-street, Nottingham. Private company. Subscribers: H. Elwin, H. Fitz A——(?) and G. V. Elwin. Registered office: Plumptre-street, Nottingham.

DALTON PAPER AND STATIONERY CO., LTD.—Capital £500, in £1 shares; to take over the business of a manufacturing stationer, carried on by W. Kay at 22, New Brown-street, Manchester, as the "Dalton Stationery Co." Private company. First directors: W. Kay and J W. R. Scholes. Registered office: 22, New Brown-street, Manchester.

NORTHFLEET ESPARTO PLANT, LTD.—Capital £40,000. in £1 shares; manufacturers of, and dealers in, paper, cardboard, wood and other pulp and articles made of or from paper, pulp, cellulose, esparto or like substances, paper mill owners, dealers in waste materials for making paper and pulp, timber merchants and growers, sawmill proprietors, manufacturers of plain and fancy boxes, cases, tubes, bags, tickets, papier mache, envelopes, stationery, manufacturers of and dealers in cellulose, chemicals and oils, etc. Private company. Subscribers: E. H. Wiseman and G. W. Waspe. First directors by subscribers.

DE VAINS' PROCESS, LTD.—Capital £5,000, in £1 shares (4,500 "A" and 500 "B"); to acquire from A. R. de Vains et Cie, of 10, Rue Henri, Grobou Miribel (Ain), France, the benefit of certain existing patents and processes relating to the manufacture of paper pulp, cellulose and the like, and to carry on the business of manufacturers of, and dealers in, paper, cardboard, wood pulp and pulp of all kinds, and articles made of paper, pulp or like substances, dealers in waste materials for making paper and pulp of all kinds, stationers, envelope manufacturers, timber merchants and growers, sawmill proprietors, chemists, etc. Private company. Subscribers: E. H. Wiseman and G. W. Waspe. First directors by subscribers.

IRVING, KNIGHT AND IRVING, LTD.—Capital £100, in £1 shares; general merchants and traders, stationers, printers, publishers, etc. Private company. Subscribers: R. T. Dummer and G. H. Olley. First directors by subscribers. Registered office: 17, Coleman-street, E.C.2.

WORTEX MANUFACTURING CO., LTD.—Capital £2,000, in £1 shares: to acquire the business of a manufacturer, importer and exporter, carried on by Eugene Szekely as "The Wortex Manufacturing and Trading Co.," and to carry on the business of manufacturers, importers and exporters of and wholesale and retail dealers in electrical apparatus, stationery and fancy goods, etc. Private company. First directors: E. Szekely and K. S. Lowe. Registered office: 62, Oxford-street, W.1.

VIDEX CO., LTD.—Capital £500, in 5s. shares; engineers, photographers, printers, etc. Private company. Subscribers: F. J. Henocq and A. J. Henocq. Subscribers appoint first directors. Registered office: 22, Huntsworth-mews, Upper Baker-street, N.W.1.

JOHN WILSON AND SONS (BIRMINGHAM), LTD.—Capital £60,000, in £1 shares; to acquire the business of a wholesale grocers and provision merchants now carried on as "John Wilson and Sons" at 50, 51 and 52, Well-street, Birmingham, and to carry on the same and the business of paper merchants, etc. Private company. First directors: J. Wilson, W. J. Wilson, W. E. Wilson and P. A. Rodway. Registered office: 50, Well-street, Birmingham.

MANTZ AND REID, LTD.—Capital £1,000, in £1 shares; importers and exporters of and dealers in British, Colonial, American and foreign produce, printers, newspaper owners, publishers, etc. Private company. First directors: W. Mantz, J. H. Reid and E. O. Priestley. Registered office: 1, Leadenhall-street, E.C.3.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

FLICKER'S, LTD. (printers).—Debenture and as collateral security thereto a mortgage, both dated June 25th, 1923, to secure £650, charged on the company's undertaking and property, present and future, including uncalled and unpaid capital, and 84, Westow Hill, Upper Norwood, S.E. Holder: S. Nicholson, Gothic Cottage, Walton-on-the-Naze.

PREMIER PRESS, LTD.—Two Land Registry Charges on properties in Little Surrey-street and Lancaster-street, Southwark, S.E., dated June 13th and July 2nd, 1923, to secure all moneys due or to become due from company to Westminster Bank respectively.

CAXTON PUBLISHING CO., LTD.—Satisfaction to the extent of £1,500 on July 5th, 1923, of debentures dated May 3rd, 1910, securing £40,000.

FARMER AND SONS, LTD. (printers and stationers, etc.).—Two Land Registry Charges on 295, Edgware-road, N.W., dated June 28th, 1923, to secure £2,500 and £790 4s. 9d. respectively. Holders: A. Batsford, 62, Seven Kings-road, Ilford, and others.

E. BARTLETT AND SONS, LTD. (printers, wholesale stationers, etc., Bristol).—Mortgage dated July 2nd, 1923, to secure £1,500, charged on land and premises in Bristol and yearly rent charges. Holder: H. Hosegood, Castle Velle Vue, Grove-road, Redland Bristol.

ADVERTISERS ELECTRO AND STEREO CO. LTD.—Debenture dated June 15th, 1923, to secure £250, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Mrs. N. Fry, 44, Park-road, South Tottenham, N.15.

SCHOFIELD AND SIMS, LTD. (publishers).—Further charge on certain land and buildings in Market-street, Huddersfield, dated June 21st, 1923, to secure £960. Holders: Huddersfield Building Society. (This mortgage has been endorsed on a mortgage dated October 7th, 1920, securing £5,572 4s. 6d and further advances).

"ENGLISH REVIEW" (1911), LTD. (London).—Particulars filed of £5,000 debentures authorised May 8th, 1923, charged on the company's undertaking and property, including uncalled capital, the amount of the present issue being £1,000.

ACTON BOROUGH POST PUBLISHING CO., LTD. (Acton, W.).—Charge on the company's undertaking and property, present and future, including uncalled capital, dated June 17th, 1923, to secure £500. Holder: W. S. Hair, 33, Emanuel-avenue, Acton, W.

JOHN NEILL, LTD. (lithographers, etc.)—Deposit on June 18th, 1923, of deeds of 19-15, Great John street, and 5 and 7, Atherton-street, Manchester, to secure all moneys due or to become due from company to Union Bank of Manchester.

J. D. TODD, LTD. (printers and stationers, Sunderland).—Satisfaction in full on June 30th, 1923, of debentures dated September 24th, 1914, securing £600.

MALCOLM PENNOCK, LTD. (manufacturers of canvas, bag, paper, rope, twine and tape, etc., Bradford).—Mortgage debenture dated June 28th, 1923, to secure £125, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: M. Pennock, 36, Heaton Hill Top, Battershaw, Bradford.

PEARLITE BOX CO. (1918), LTD. (London).—Issue on July 2nd, 1923, of £100 debentures part of a series already registered.

ELLISON PARKINGTON AND CO., LTD. (manufacturing stationers, printers, etc., Blackburn).—Particulars filed of £4,000 debentures, authorised June 29th, 1923, charged on the company's property, present and future, including uncalled capital; the amount of the present issue being £2,250. Also registered mortgage of even date to secure £2,500, charged on Soho Foundry, Blackburn. Holder: A. Walch, "Wycollar," Pedders Lane, Ashton, Preston. Also registered mortgage dated June 30th, 1923, to secure £2,500, charged on above mentioned Soho Foundry. Holders: H. S. Haworth and P. Haworth, 7, Lord-street West, Blackburn.

BANKRUPTCIES, etc.

Re GEOGRAPHIA, LTD.—Meetings of creditors and shareholders were held on July 11th at the Board of Trade Offices, Carey-street, under the compulsory winding-up order made against Geographia, Ltd., of Fleet-street, E.C., which was registered in 1910 to publish maps and guides. Mr. J. B. Thompson, official receiver, who presided, said that the company had also dealt in foreign postage stamps, and more recently had published picture and scholastic books. In November, 1919, and January, 1920, branches were established in New York and Melbourne, but they involved the company in a loss of £7,050. In 1920 the company made a profit of £17,819. During that year it had handled a contract for the publication of an atlas for the Harmsworth Press, and apparently the profit induced the managing director, Mr. Alexander Gross, to buy large quantities of raw material and produce manufactured stock on a large scale. This happened just before the industrial depression set in. On November 30th last Mr. Gross left the country, and had since taken no part in the management of the company's affairs. The official receiver added that the company presented its own petition for winding up on April 10th. A special manager was at once appointed, and he conducted the business until April 20th, when the assets were sold for £9,000. How much of that sum

Digitized by Google

would be available for distribution among the unsecured creditors, whose claims amounted to £47,070, it was at present impossible to say, as the liabilities included a large claim for income-tax, and there were other claims by preferential creditors. The gross liabilities were estimated at £56,035. The liquidation was left in the department of the official receiver.

Belgian Paper Trade.

Tracing industrial development in Belgium during 1922, the Commercial Secretary to H.M. Embassy at Brussels says: The situation in the paper industry has improved during the year, and production has increased. The output of the factories affiliated to the Comité Central Industriel amounted to nearly 100,000 tons for the first 10 months of 1922. There are 15 non-affiliated factories, but it is considered that these figures can be taken as representing the position of the industry.

The import trade from the United Kingdom has been handicapped by exchange fluctuations, and orders have had to be cut down to a minimum. In papers, other than printing and wall-papers, the bulk of the trade was with Germany (8,150 tons). The Netherlands (4,100 tons), Sweden (1,970 tons), Finland (1,600 tons), the United Kingdom (1,100 tons), and Czecho-Slovakia (600 tons) were other sources of supply.

Printing paper came from the Netherlands and Germany and wall-paper from Germany (580 tons), France (250 tons), and the United Kingdom (176 tons).

Rags were procured principally from the United Kingdom (10,000) tons and France (8,200 tons).

In the printing paper export trade the shares of Germany and France amounted to 2,587 and 2,085 tons respectively. The principal buyers of other sorts of paper were the United Kingdom (4,100 tons), France (4,000 tons), Japan (3,400 tons), and the Netherlands (1,650 tons).

Exports of rags to the United States amounted to 16,500 tons.

Russia's Paper Industry.

Low Production and Consumption.

The position of the Russian paper industry naturally has an influence upon other markets, and, deeming it wise to take stock of the situation, Mr. F. T. Harris (assistant vice-president of the International Paper Co.) thus reviews matters:—

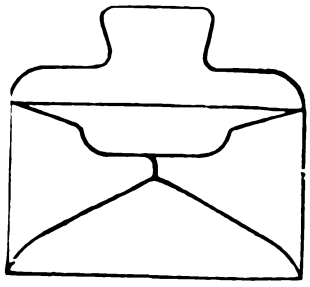
Although before the war Russian paper mills supplied only 18 per cent. of the total domestic consumption of all kinds of paper, yet it is obvious that Russia's enormous forest wealth and water powers will ultimately place the country among the great paper-producing nations of the world. This will not be realised, however, for over a decade, as the rebuilding of Russian industries must proceed by districts, and a return to normal industrial life on a national basis cannot possibly be expected within that period. Then, too, the eventual construction of paper mills can only be accomplished with the support of the Government, as the greater part of the forests is owned by the State.

During the next ten years Russia must therefore be an importer of paper on a vast scale. The latest authentic information available shows that imports of paper are consistently increasing monthly. Finland, as before the war, is again the backbone of Russia's paper supply, and Germany, Czecho Slovakia and Esthonia are shipping in paper to a very limited extent.

When one considers that before the war, in 1913, Russia produced 424,000 tons of papers of all kinds; in 1920, 40,800 tons; and in 1921, 36,000 tons, one receives a vivid picture of how Bolshevism has ruined the paper industry, in common with other industries. And the picture becomes more vivid when it is known that the average production of paper decreased from 34,668 pounds per worker per year in 1913, to 3,611 pounds per worker per year in 1920.

Russia's demoralised state can be readily gauged by its almost negligible consumption of paper. The consumption of all kinds of paper now amounts to only about one pound per capita per annum, while in the United States, for instance, the consumption is this year, more than 40 pounds per capita of news-print paper alone.

Paper in the Dutch Indies.



During 1921 total imports of news paper represented about 1,000,000 gulden. Of this total about 33 per cent. came from Holland, 25 per cent. from U.S.A., 20 per cent. from Scandinavia, and 10 per cent. from Japan. The value of the imports of writing paper was 2,500,000 gulden—60 per cent. from Holland, 15 per cent. United States, 4 per cent. Great Britain.

New Uses for Paper.

Although rosy accounts are given of the condition of the paper industry in America, efforts are being made there to introduce new uses for paper.

It is recalled that the introduction of paper drinking cups came as a boon to the industry, and now experiments are being made along many lines for use of paper. There has just been started the production of radio loud speaker horns, made entirely of pulp. Paper bottles for milk distribution are being successfully introduced. It may take several years for this business to develop to a profitable size, but Mr. George M. Seaman points out these as instances of the constantly expanding demand for paper products.

Are you planning for the new Postal Regulations?

After December the Post Office will not accept envelopes with tucked in flaps when they exceed 4½ in. in width. This will mean a larger demand for commercial and pocket shapes with tongue flaps.

We can supply you with "LEADER" envelope machines without drying chain, which will produce these shapes at a high speed, the output being more than

50,000 per day.

Paper Trade Statistics.

Overseas Countries' Imports and Exports of Paper.

The quarterly return dealing with the figures up to March 15th, 1923, issued by the Board of Trade, gives the following interesting statistics relating to the imports and exports of paper of certain foreign countries and British Possessions:—

FINLAND.—In the twelve months ended December news-print was exported from Finland to the extent of 130,083 tonnes (of the value of 468,253,000 marks), as against 93,896 (428,658,000 marks) in the twelve months of 1921, and 90,072 (344,624,000 marks) in the twelve months of 1920. Packing paper exports in the three respective periods were: 30,618 (124,987,000 marks), 17,521 (85,756,000 marks), 27,142 (102,684,000 marks). Pasteboard figures were: 24,690 (71,428,000 marks), 12,536 (38,639,000 marks), 40,163 (78,230,000 marks). Writing paper exports stood at 11,359 in 1922 (twelve months), 6,482 in the previous year, and 8,653 in 1920. The following paper exports for the month of January for this and the two previous years were as follows: News-print, 10,546 (1923), 8,144 (1922), 6,857 (1921); packing paper, 2,467 (1923), 1,856 (1922), 590 (1921); pasteboard, 1,779 (1923), 1,725 (1922), 311 (1921).

NORWAY.—Printing paper exports during the months ended December stood at 148,416 tonnes, compared with 61,431 in the previous year and 123,154 in 1920 (twelve months). Packing paper exports represented 67,984 tonnes last year, 20,205 in the twelve months of 1921, and 60,722 during 1920. In January last 12,379 tonnes were exported, against 8,999 in the corresponding month of 1922, and 8,752 in the same month of 1921. Packing paper exports amounted to 4,508 in January this year, 3,950 last year, and 1,006 in 1920.

SWEDEN.—Paper "of all kinds" during the twelve months ended December was exported to the extent of 263,435 tonnes, contrasted with 174,627 in the twelve months of 1921 and 260,437 in the 1920 period. Under the same category, these exports for January last stood at 23,876, as against 17,394 in the corresponding month last year, and 8,329 in January, 1921.

DENMARK.—The value of the imports into Denmark of paper and paper manufactures in 1922 (twelve months) stood at 25,694,000 kr., as compared with 25,192,000 kr. in 1921, and 47,529,000 kr. in 1920 (January to December). For the month of January these imports were valued at 1,355,000 kr., as against 2,054,000 kr. in January last year, and 2,126,000 kr. in the corresponding month of the previous year.

GERMANY.—Given in 100 kilos., fancy, coloured, varnished, etc., paper was exported from Germany during the 12 months ended December amounted to 742,717 (of the value of 5,657,677 paper marks), as compared with 239,982 (18,790,000 gold marks) during the 12 months of 1913. Photographic paper exports stood at 14,483 (1,497,121 paper marks) last year, and 15,412 (5,573,000 gold marks) in 1913 (12 months).

NETHERLANDS.—In tonnes, the imports of printing paper (including news-print) and writing paper imported into the Netherlands during the 12 months last year amounted to 34,167 (of the value of 8,241,000 guldens), 22,305 (8,411,000 guldens) in 1921, and 33,051 (22,130,000 guldens) during 1920. Exports from the Netherlands of the same class of merchandise represented 36,308 (9,616,000 guldens) last year (12 months), 30,388 (10,980,000 guldens) in 1921, and 19,550 (13,444,000 guldens) during 1920. The exports of the class of goods just mentioned stood at 3,874 in January of the present year, 2,155 in the corresponding month last year, and 2 623 in the same month of 1921. Strawboard exports reached 171,484 tonnes last year, 92,284 in the 12 months of 1921, and 194,435 during January to December, 1920. [Gulden = 1s. 8d.]

BELGIUM.—The imports of paper and cardboard into Belgium (including Luxembourg) for the eight months ended December reached 22,058 tonnes (of the value of 39,167,000 francs). Exports of the same class of material stood at 26,683 (49,977,000 francs). Paper and cardboard imported for home consumption into the Belgo-Luxembourg Economic Union during January amounted to 3,318 tonnes, valued at 6,137,000 francs. Exports therefrom of paper and cardboard were 2,002, of the value of 3,577,000 francs.

FRANCE.—Paper and manufactures (including books) imported into France (in 100 kilos.) during the 12 months last year amounted to 1,445,521 (230,385,000 francs) comparing with 756,600 (221,636,000 francs) in the previous year, and 1,557,128 (578,582,000) during January to December, 1920. Exports of paper last year (12 months) stood at 342,520 tonnes, 320,745 in 1921, and 365,310 in the preceding 12 months.

SWITZERLAND.—Given in 100 kilos., the quantity of printed books imported last year reached 29,948, as against 24,122 in 1921, and 33,274 in the 12 months of 1920. Printing paper leaving Switzerland during the 12 months last year stood at 122,144 as compared with 85,609 in 1921 and 105,604 in the corresponding period of 1920.

SPAIN.—Paper for cigarettes was exported from Spain during January, 1922, to the extent of 186 tonnes, 407 in the corresponding month of 1921, and 81 in the first month of 1920.

ITALY.—Paper (white or dyed in the pulp) exported during the nine months ended September, given in 100 kilos., amounted to 21,599, as compared with 26,691 in the previous corresponding period and 38,275 during January to September, 1920.

CZECHO-SLOVAKIA.—The exports of packing paper, in 100 kilos., from Czecho-Slovakia during last year (twelve months) amounted to 190,078 as contrasted with 192,546 in 1921. The following were the other classes of paper leaving that country in 1922, the figures in parenthesis representing the twelve months of 1921: Printing paper, 101,328 (104,216); cardboard, 36,508 (56,121); writing paper, 26,895 (44,557); cigarette paper, 7,652 (17,699).

GREECE.—Printing paper imported during the six months ended June, 1922, reached 12,938 tonnes (of the value of 7,458,000 drachmas), as against 1,990 (4,259,000 drachmas) in the previous corresponding period, and 2,490 (2,605,000 drachmas) in the first six months of 1920. Writing paper imported in the three respective six monthly periods stood at 291 last year, 600 in 1921 and 765 in 1920.

EGYPT.—Imports of paper and other classes of paper goods imported into Egypt (in kilos.) during the twelve manths of 1922 were as follows, the figures in parenthesis representing the amounts for the whole of the preceeding year: Wrapping, 10,480,558 (8,043,344); cardboard, 6,808,109 (4,053,278); printings, 5,814,805 (3,098,531); writings and envelopes, 1,463,036 (1,104,001); cigarette paper, 565,638 (415,880). Cigarette paper exported in the twelve months last year stood at 40 tonnes, against 100 in 1921 and 237 in 1920.

BRAZIL.—Paper and paper manufactures entering Brazil during the nine months ended September last stood at 31,191 tonnes, compared with 22,504 in the corresponding period of the previous year, and 30,781 in the nine months of 1920. The value of last year's nine months' imports amounted to 34,192,000 milreis, as against 50,370,000 milreis in the preceding year, and 40,167,000 milreis in the 1920 period. [Milreis in 1920, 15¾d.; 1921, 8¾d.; 1922, 7¼d.]

JAPAN.—Given in piculs, the imports into Japan of printing paper during the eleven months ended November stood at 429,602 (of the value of 7,979,000 yen), as contrasted with 118,421 (3,590,000 yen) in the corresponding period of 1921, and 145,343 (5,201,000 yen) in the eleven months of 1920. Packing paper imports for the three eleven-monthly periods for the respective years were as follows: 1922, 242,152 (3,963,000 yen); 1921, 116,474 (3,409,000 yen); 1920, 160,915 (5,101,000 yen). The value of paper and paper manufactures exported in the eleven months ended November amounted to 20,257,000 yen, against 23,338,000 yen in 1921, and 32,037,000 yen in the preceding year (eleven months).

SIAM.—Imports of unprinted paper during the twelve months last year reached 2,442 tonnes, compared with 1,987 in 1921, and 1,562 in the twelve months of 1920.

BRITISH INDIA.—The value of paper imports into British India during the nine months ended December, 1922, is given as 1,94,93,000 rupees, as compared with 1,56,37,000 rupees in the nine months of 1921, and 5,35,21,000 rupees in the corresponding period of 1920.

CEYLON.—Paper imports for the twelve months of last year were: Printings, 18,797 cwts.; writings, 7,364 cwts. The values of paper imports during last year (twelve months), and the two previous years were as follows: Printing, 5,44,000 rupees (1922); 4,99,000 rupees (1921); 13,39,000 (1920). Writings, 4,54,000 rupees (1922); 4,36,000 rupees (1921); 4,90,000 rupees (1920). Other paper 12,35,000 rupees (1922); 5,66,000 rupees (1921); 3,53,000 rupees (1920).

NEW ZEALAND.—Paper imported during the eleven months ended November, 1922, reached a value of £663,000, as against £1,249,000 in the corresponding period of the preceding year.

BRITISH SOUTH AFRICA.—Printing paper imported into British South Africa during the eleven months ended November amounted to 257,903 cwts. (of the value of £366,000), as compared with 258,636 cwts. (£717,000) in the 1921 period, and 263,775 cwts (£803,000) in the eleven months of 1920. Wrappings imported reached 86,774 cwts. (£137,000) last year (eleven months), 66,126 cwts. (£211,000) in the preceding year, and 66,724 cwts. (£245,000) in the 1920 period. The value of other paper entering British South Africa last year stood at £122,000, compared with £124,000 in 1921, and £296,000 in the eleven months of 1920.

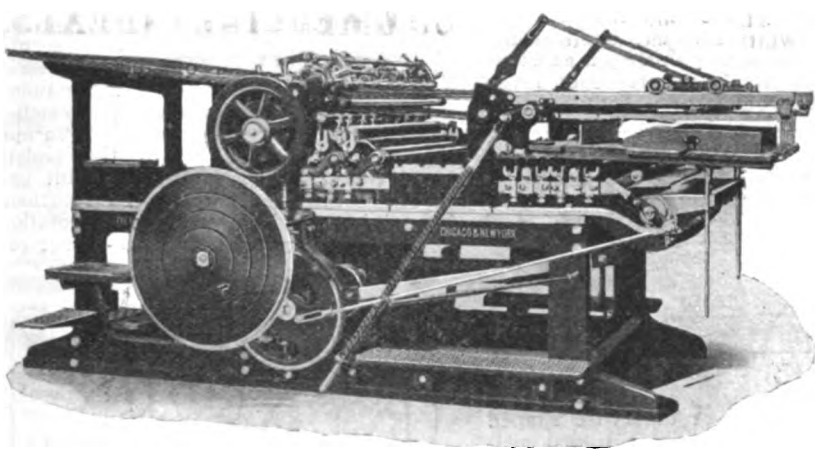
The . . .



American Miehle Company's THREE-ROLLER Two-Revolution Press.

SPECIFICATION.

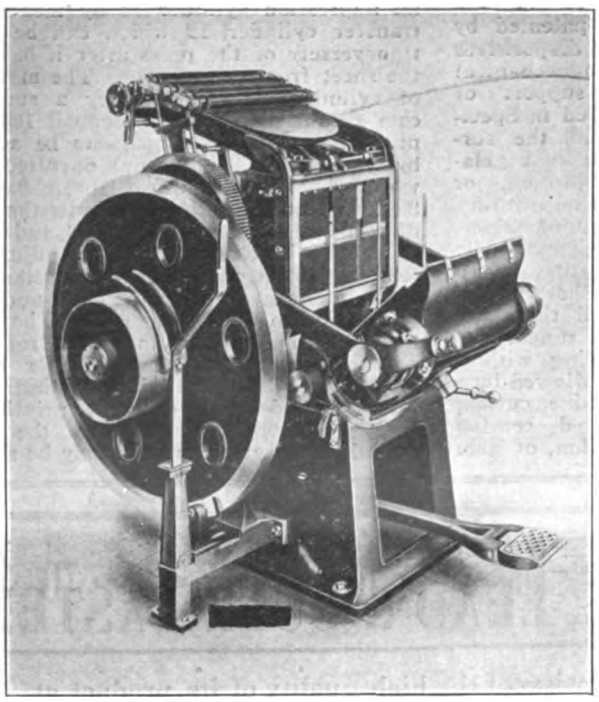
Type matter locked in Chase, 24 in. × 38 in.

Largest sheet which can be delivered, 26½ in. × 41½ in. (approximately Double Royal).

The Inking arrangements on this machine are adequate for all requirements. The Three-roller Press has a pyramid of eight rollers and riders over the forme, three of the rollers being inkers.

Gear side view of the American Miehle Company's Three-roller Two-Revolution Press.

Over-all measurements:
Width 7 ft. 10 in.
Length with sheet delivery 12 ft. 3 in.
Practicable speed per hour 2,400.



THE American Miehle Company's Three-roller Two-revolution Press will handle satisfactorily every class of work undertaken by the Jobbing Printer. It will print the heaviest and lightest formes with equal ease. It registers to a hair and delivers faultlessly. It is an American Miehle Company's Press, in no way inferior to that Company's regular Four-roller machine, bearing the same high reputation, and giving the fullest satisfaction where installed.

This machine may be seen running by appointment.

MIEHLE PRINTING PRESS & MANUFACTURING CO., Ltd.,

BLACKFRIARS HOUSE, NEW BRIDGE STREET, E.C.4.

New Inventions

Cylinder Jobbing Machines.

In an invention by the American Type Founders Company, a cylinder machine of jobbing type is constructed with a bed 12, which reciprocates on ways 11 inclined to the vertical, the sheets being fed from a table 41 approximately at right-angles to the bed and delivered to a box 82 by reciprocating grippers 73, which move over a way 64 parallel to the table 41. The various operations of the press are controlled by cams on cranks on a main shaft 15 which reciprocates the bed by a crank and a pitman 16. A rack 13 on the bed gears with and oscillates an impression cylinder 19 mounted in eccentric bearings 23 which are operated by a cam 33, lever 29, link 30, hook 34, pin 35, arm 28, arms 26 and links 25, to throw the impression on and off, the hook 34 being capable of operation by a treadle 36, link 37, and lever 38, to disengage it from

the pin 35 and thus trip the throw-off mechanism. The sheets are registered by a front stop 42 which is depressed by a link 45, lever 46, and cam 49, to allow them to be taken by a gripper 50 which is opened at the sheet-receiving position by the action of a swinging cam 56 on a roller 54 on an arm on the gripper shaft 51 which is returned by a spring to close the gripper on the sheet. The printing occurs in the upward movement of the bed, and when the cylinder has made half a revolution to effect the printing, the impression is thrown off and a fixed cam 62 opens the grippers 50 and a stripper 83 strips the sheet, which is taken by the grippers 73. The grippers 73 are normally closed by a spring, and are opened to take the sheet by the rotation of a member 76 arranged between them, the member 76 having an arm 77 which engages a roller on a cam-operated lever arm to open the grippers to take the sheet, and a pin 78 to open them to release the sheet after the carrier 63 on which the grippers are mounted has been moved to the left by a cam-operated lever 70. The bed is inked by inking mechanism 87, 88, 89, 90.

Step and Repeat Printing Frame.

An invention by the Printex Process Corporation consists of a vacuum-pressure printing-frame which may be displaced step-by-step over a sensitised surface of large area, and which comprises a body portion 1 having a printing-aperture 2 and recessed at 3 to receive a negative 4 which is pressed against stops 7 on two adjacent sides of the recess by spring-controlled pivoted latches 8 on the opposite two sides. The stops, latches and the edges of the negative may be bevelled or otherwise shaped to press the negative against a lipped sealing-member 15 of leather, rubber, &c., extending round the edges of the recess 3. A similar sealing-member 18 extends round the edges of the body 1, so that when the frame is placed upon a sensitised sheet 22, the negative 4 and sheet 22 are slightly separated. Air is exhausted from the sealed recess 3 as through a nipple 24 provided with a spring-pressed ball check valve. Lugs 25 on the body permit the frame to be attached to a printing-apparatus. In the case of a step-and-repeat machine or a photo composing machine the frame is supported on a carriage displaceable horizontally and vertically with respect to a vertically disposed sensitised surface, such as a zinc plate.

FIG.2.

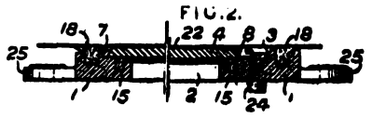

Photo-Mechanical Printing Surfaces.

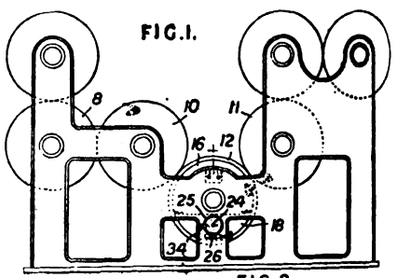
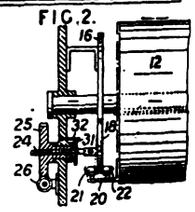
In this invention, which is patented by Mr. E. Seyfferth, negatives or diapositives used in the production of photo-mechanical printing surfaces comprise a support of cellon, manufactured as described in Specifications 18189/10 and 27258/10, the surface of which is treated with a weak gelatine or chromated gelatine solution, or with glacial acetic acid or acetone in order to prepare it for the reception of letterpress printing. Illustrations, previously mounted on thin cellon sheets, may be attached to the same support. Photographic films may be so employed, and these are transferred from their original supports to the thin cellon sheets by coating with a dilute solution of caoutchouc followed by a dilute solution of cellon or gelatine, cutting round the part to be transferred, coating this part with a solution of cellon, or gum arabic, pressing a thin cellon sheet thereon, and then stripping the cellon and adhering film.

Multi-Colour Printing.

In this invention, patented by the Harris Automatic Press Company, a multi-colour printing press having the printing-members in tandem is constructed so that the sheet may be moved transversely of the press between successive impressions to secure a good lateral register of the impressions. The machine is constructed to include an impression or transfer cylinder, which can be adjusted while the machine is in operation to make part of its rotation and then be shifted laterally to an adjustable extent in either direction, and to be returned to its original position when each rotation is complete. As applied to a two-colour rotary offset press, the printed sheet is transferred from the impression cylinder 10, Fig. 1, which coacts with an offset cylinder 8, to an impression cylinder 11 by means of a transfer cylinder 12 which can be moved transversely of the press after it has taken the sheet from cylinder 10. The movement of cylinder 12 is effected by a stationary cam comprising a fixed segment 16 and a pivoted segment 18, which can be adjusted by a screw 24 and a nut operated by a worm-wheel 25 and worm 26. A fixed pin 32 in a slot 31 in the nut limits the extent of adjustment, and a pointer 34 and a scale indicates the amount of the adjustment. Rollers 21, 22, on a bracket 20 attached to the cylinder 12 embrace the cam, and transfer motion to the cylinder 12. The invention may be applied to direct rotary or cylinder presses, and the cylinder 12 may be an impression cylinder coacting at different periods with different printing-surfaces. Instead of moving the whole cylinder, the grippers only may be moved.

FIG.1.





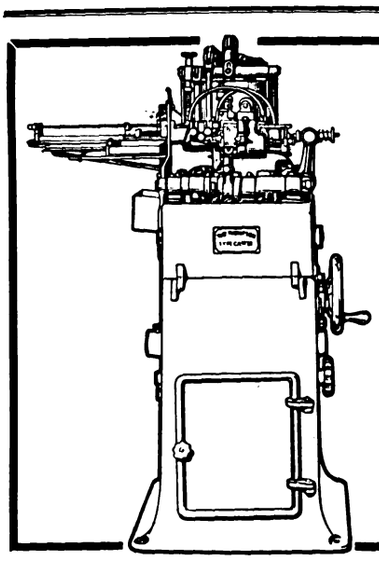


FIG.2.

THE

THOMPSON TYPE, LEAD & RULE CASTER

Reliability of a typecaster consists of the high quality of its product at a cost low enough to make non-distribution economical.

Thompson quality is a standard of accuracy not surpassed even by typefounders.

Simple, complete and compact, using Linotype, Intertype and its own matrices interchangeably, the Thompson produces more type than any other typecaster on the market and equals the out-put of two of some other makes.

Type in all languages from 5 to 48 point, leads, slugs and rule 2 to 12 point, accurate in every detail, are produced on the Thompson Type, Lead and Rule Caster.

Paper Agent's Clerk Sentenced.

At the Central Criminal Court, before the Common Serjeant, on June 29th, Sidney Herbert Ifield, 30, a clerk, of George-lane, Hither Green, Lewisham, was charged with stealing certain sums of money, the banker's drafts in connection with such sums, and falsification of accounts, the property of his employer, Mr. Terge Valdimar Olsen, paper importer, of Lambert House, Ludgate-hill. There were further charges of forgery and theft.

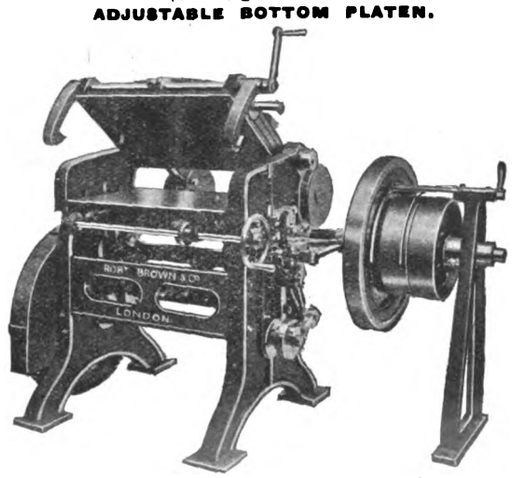
Mr. Olsen's evidence was to the effect that during his periods of absence from his office he left with prisoner certain crossed and signed open cheques for use in the payment of the accounts of such consignments of paper as would be delivered from time to time, and it was the prisoner's duty to fill in the amounts, which would be checked against the bills of lading. The prisoner, however, filled in these cheques payable to cash, and received the money himself. He trusted the prisoner implicitly, and it was mentioned that Mr. Olsen had shown him much kindness. The total sum involved was a large one.

The prisoner pleaded guilty to all the charges, except that of forgery, which was withdrawn.

The Common Serjeant said that Mr. Olsen had treated the prisoner with every consideration and kindness, but his confidence had been entirely misplaced. In return prisoner had abused the confidence reposed in him. He had been wisely advised in pleading guilty, and had he persisted in the line of defence he had adopted he would have received a very severe sentence. Having regard to the fact that Ifield had been in prison for ten weeks, and had previously borne a good character, the lowest sentence that he could impose was one of six months in the second division.

Sir Richard Muir and Mr. H. W. Potter (instructed by Messrs. Herbert Oppenheimer, Nathan and Vandyk, of 1, Finsbury-square, E.C.), prosecuted, whilst Mr. Norman Birkett was for the defence.

THERE can be no permanent profit without permanent service.



Printed Matter for Canada.

In connection with the Canadian Order-in-Council of September 21st, 1922, which provided for the marking with an indication of the country of origin of all printed or lithographed matter imported into Canada, it should be noted that an Order-in Council dated June 11th, 1923, amends the origina- Order-in-Council by exempting from the requirement of such marking, the following kinds of printed or lithographed matter, viz.:—"Seals, tickets and labels, which are not capable of being marked legibly, and each of which shall not exceed one inch in diameter, in which case the first package or covering shall be marked in compliance with the general marking regulations."

MESSRS. LIVINGSTONE, PAGE AND CO. hitherto joint agents, are now sole agents for Messrs. Edward Collins and Sons, Ltd., the well-known Scottish esparto papermakers.

— SIMPLICITY —

The Keynote of the WINKLER Automatic Feeder.

Simplicity also means efficiency. Simplicity permits quantity production at moderate cost. The WINKLER Feeder, through its simplicity and absence of confusing adjustments has set a new standard of value, combining the utmost efficiency and reliability with a remarkably low price. Standard parts are used exclusively for the construction.

SWISS MANUFACTURE.

SEPARATION of sheets by suction and blast.

Length of printing machine is not increased and access not impaired.

Feeds to register any stock from tissue to board.

Works in unison with the machine, and at any speed up to the maximum guaranteed by the press makers.

Rapid change of jobs, and therefore suitable for short runs.

No tapes or friction wheels, and therefore no marring of colours or setting-off when working colours or backing up.

The blast of air frees the sheet from dust and fluff before it is fed.

Adaptable to any type and size of sheet fed press; if desired, with a Stacking Arrangement.

Tuberculosis in the Printing Industry.

Abstract of Paper Read by Mr. George A. Isaacs before the Conference of the National Association for the Prevention of Tuberculosis held in Birmingham on July 12th and 13th.

It is now generally accepted that the prevalence of tuberculosis is relatively higher in the printing trades than in any other. This opinion is held in other countries as well as in England. Available information and statistics on this point are contained in a report by the United States Department of Labour (Hygiene of the Printing Trades; Bulletin of the United States Bureau of Statistics; Industrial Accidents and Hygiene; Series No. 12). Here are figures given for England, Holland (De Vooys), France (Guignard), Austria, Italy (Carozzi), Germany (Hahn), Switzerland (Bertillon) and for the United States, with copious references, showing the same prevalence of tuberculosis amongst printers in each of those countries. The following reference to German experience is given: " . . . even in those German cities in which the death-rate among printers has been very notably lowered of late years, actually below that of the general population, yet if one takes the tuberculosis rates alone, the printers are always in the lead. For instance, in Munich, in 1907, tuberculosis caused 30·4 per cent. of all deaths among members of the general sick fund, while, among the printers, 46·3 per cent. were from this cause."

The late Professor Benjamin Moore, D.Sc., F.R.S, conducted an inquiry into the prevalence of tuberculosis in the printing industry for the Department of Applied Physiology and Hygiene Medical Research Committee. With the active co-operation of the printing trade unions and approved societies, he examined mortality tables and obtained information showing the inroads of tuberculosis amongst English printers. In an article in the *Lancet*, November 9th, 1919, he draws attention to the fact that the death-rate amongst the trade union compositors "over a period including the 35 years previous to the outbreak of the war proves that the relative death-rate from phthisis during that period fell from one death from phthisis in three total deaths to less than one death from phthisis amongst five total deaths." After commenting upon this fact, he says further: "It is commonly supposed that compositors are the most heavily hit in the printing trades by phthisis. This is not, however, the case, for amongst one unfortunate set of these workers, namely the Operative Printers and Assistants, *nearly one-half of all the deaths are due to phthisis even in the present times.*" (The italics are Prof. Moore's.)

Professor Moore amplified this point in a report (Occupation and Tuberculosis: A Study of the Incidence of Tuberculosis in the Allied Printing Trades) of his investigation, which now lies somewhere in a dusty Government pigeon-hole. He says: "This trade union, attending to machines only, has had, and now has, the worst incidence of tuberculosis in the branches engaged on printing work." He gave very full details of his inquiry, and re-stated the astonishing death rate from tuberculosis amongst printers' assistants. The records upon which his report was drafted are, I understand, in the library of the Department of Applied Physiology. Professor Moore's figures were up to, and including, 1914. I have prepared information on the same basis including the years 1915 to 1922. It is advisable, however, to make the following comments, first, that we are satisfied that there are more deaths from tuberculosis than the death certificates would indicate. It should be remembered that in a trade union such as ours we are in close contact with the great majority of members, especially in their times of sickness, and men known to have been suffering from tuberculosis have been certified to have died from collapse, hæmorrhage, and in some cases, bronchitis, etc. The second point to be mentioned is that the membership of the society has recently been extended outside machine-room workers, thereby favourably affecting our figures. For the period 1915-1922 inclusive our total deaths from all causes (excluding war deaths, suicides and accidental deaths) number 507. Of these 117 were certified as tuberculosis, showing one death from tuberculosis out of every 4·33 deaths from all causes. This, it will be seen, is a steady improvement upon the figures given by Professor Moore.

Causes of Tuberculosis.

The question arises in the mind of the layman: Why should tuberculosis be so prevalent amongst printers? and the layman cannot answer. In October, 1920, Doctors Halford Ross, Leonard Hill and Edgar Collis, who are all respected in the printing trade for their efforts in this matter, engaged in correspondence debate in *The Times* as to the cause of tuberculosis amongst printers. I do not know which of these gentlemen was right, but I hope they will argue their point to a finish so that the printers may benefit.

Some authorities believe the presence of lead in the printing industry to be an important factor in the causation of tuberculosis. The Austrian Government report on health conditions in the printing trades, published in 1909, refers to the fact that lead poisoning and tuberculosis go hand in hand in this industry. De Vooys, of Holland, regards lead as an important factor in lowering the resistance to tuberculosis. Legge and Goadby attribute the tuberculosis of printers to the vitiated air, sensitiveness to cold and fumes of gas from the linotypes. I would point out that there were more deaths from tuberculosis before linotypes were introduced than there are now that their use is quite common; also that printers' assistants do not usually work near linotypes. In America a similar view is also held, and I quote again from Hygiene of Printing Trades: "The chief injury done by lead is probably to be found, not in the production of true plumbism, but in a lowering of the resistance to other diseases, especially to certain infections. In this way is explained the high death rate from tuberculosis." Also: "The indirect effects of lead poisoning amongst printers are far more serious than its direct effects as a primary cause of death."

In Europe it is held, and some statistics are produced in support of the view that the printing industry attracts the weaklings instead of youths of average health. This point of view is rejected in America. It has been put forward in England, but there has been no inquiry and there is no information upon which accurately to base any opinion. In all countries reference is made to the sedentary nature of the occupation, the irregular hours, night work and the absence of fresh air from printing offices. The question of dust is also freely referred to, but mainly in its connection with lead poisoning. Professor Moore stresses the absence of sunlight in machine-rooms as a cause of lowered vitality and greater risk of infection.

As a layman, I submit the following as some reason for the prevalence of tuberculosis amongst machine-room workers. These men in the past had to exist upon an exceedingly low standard of living due to low wages, which allowed them but the poorest of house accommodation, unsuitable clothing, and compelled them to work long hours with insufficient and totally unsuitable food; badly ventilated rooms (generally underground); bad lighting, leading to dirty rooms and dirty habits — for no decent-minded man would indulge in spitting in clean surroundings—in addition to the loss of the tonic effects of sunshine and daylight; the very poor standard of sanitary accommodation then prevalent; the total absence very often of provision for washing and the care of wet clothing in bad weather and the absence of convenience for taking meals outside the press-room. Imagine the risk to men engaged under conditions such as these with

numbers of their comrades in advanced stages of tuberculosis, able, by nature of their work, to continue working to within a very short period of death!

Decreasing Prevalence of the Disease.

All the indications show that the preponderance of tuberculosis is decreasing, although it is still alarmingly prevalent. The report of the United States Bureau of Labour Statistics gives carefully compiled statistics on this point. Figures I have quoted of my own society are evidence of that improvement, but these are merely the unscientific statements of a layman. The American printing trades, both trade unionists and employers, through their Joint Conference Council, being alarmed at the condition of affairs are—with the co-operation and active assistance of the United States Department of Labour—inquiring into this question for themselves. Mr. F. L. Hoffman, Consulting Statistician, is in charge of the inquiry, and in a recent paper refers to the death rate from tuberculosis amongst American printers from the statistics already prepared. He says: "The experience is not sufficient for final conclusions, but suggestive of a decided improvement principally as regards the proportionate mortality from pulmonary tuberculosis during recent years." And further: "Reference to the table of the Metropolitan Assurance Corporation relating to printers 1919-1921 shows 903 deaths of which 209 or 23·1 were the result of pulmonary tuberculosis."

In a recent letter to the writer, Mr. Hoffman says—and I draw attention to his comment as to death certification—"Granting that death certification is not all that it should be . . . as far as I am at present in a position to judge, tuberculosis is less a factor with us than formerly."

In Great Britain the matter is being seriously considered by the Joint Industrial Council of the Printing Industry and by the London Newspaper Proprietors. It is but fair to state that the employers in the industry are keenly concerned about the matter and show a willingness to assist in remedying the state of affairs. Before the J.I.C. was established a Health Committee for the Printing Industry was brought into being mainly through the activity of the late Mr. Walter Hazell, of Hazell, Watson and Viney. The work he initiated is to-day being carried on by the Health Committee of the Joint Industrial Council. This Committee has published leaflets upon various health questions, one of which specially deals with tuberculosis.

To my mind, judging from the reports and papers to which I have referred and to others I have received, the improvement in conditions is due to continuous propaganda and education. In my own section of the trade I am convinced that the improved standard of life now enjoyed by our members, the less hours worked, the abolition of a most pernicious system of 36-hour shifts, coupled with the unceasing propaganda of the Union, have considerably assisted towards the improved conditions that are now indicated. Better wages has led to an enormous improvement of the physical condition of our workers and greater resistance to disease. An understanding of the conditions leading to disease has brought about an improvement in workshop conditions and general habits and has broken down the custom (almost a ritual) of passing round the can of tea for all to partake of who wished. Machine-room conditions have improved considerably, but there are still many instances where the room is in full use the whole week round with an easing-off only on Sunday for a few hours. Hygienic conditions in machine rooms have received much attention, but we still await the introduction of the vacuum cleaner, as now so universal in American offices. These implements will clear away the paper fluff from the printing presses with a minimum of inconvenience and risk of infection to the men and a certain gain in time and efficiency to the management. There are still, in spite of tremendous improvement, many cases where accommodation for clothing is most primitive and provision for taking meals either non-existent or of such a character as to be a serious risk of infection. Even to-day the provision of drinking water is usually found only in the lavatories, and the bubble-jet fountain is almost unknown. Given more information and expert guidance, the printing industry will do its share toward improving conditions.

A Plea for Co-operation.

Having drawn attention to the problem in the past and the gradual improvement being made, I want to put in a plea for the co-operation of all concerned towards even greater improvement. The problem should surely be one of interest to the medical profession, who are generally eager to find out the cause of matters such as these. I am confident that the printing industry, employers and workpeople, will give every assistance. Already in the large printing offices wages are better, hours are shorter and machine-rooms are cleaner. After all, printers are only laymen, both employers and workmen, and we want expert assistance. We know that the Medical Research Committee enquired into the conditions of our trade. We know that the report of Professor Moore is pigeon-holed and, as an important section of the community, printers expect the co-operation of the medical fraternity and the active support and assistance of the Government to follow up that enquiry toward making the printing industry at least as healthy as other industries.

The Operative Printers and Assistants, stirred into action by addresses given to the members by the late Professor Moore, determined to make an effort to tackle this serious problem as it affects them. They are struggling to establish as a memorial to our comrades who fell victims to the disease of war a sanatorium to prevent others of our members falling victims to the disease of tuberculosis. We find this a very difficult task, although very cordially and generously supported by the employers in the trade. It is only mentioned here to show that the men who are suffering under this scourge are keenly alive to its dangers and anxious to improve the state of affairs. May we anticipate the co-operation of the Association in an effort to secure Government enquiry and research?

Points to Watch in Wear and Tear.

Address by Mr. Frank Colebrook.

Under this title, Mr. Colebrook gave an address at the Central Library, Islington, at the July meeting of the North London Master Printers' Association, Mr. G. T. Hunt presiding. The address followed a fair amount of routine business; accordingly Mr. Colebrook at the outset said that "in reward for good attendance" he would go immediately to the first pointer, and be as brief as would do justice to the subject at all.

Good lighting, by its obvious facility for noting what was gradually going wrong, was a good safeguard. Good lighting was deemed to cost only about one per cent. of the wage bill; bad lighting might cause a very large percentage. Undue vibration was another important consideration. He had known experienced printers obliged to recognise that they had made a mistake in placing machines where they had first put them, and forced to take them up and reinstal them on a sounder foundation.

Dealing with cylinders, Mr. Colebrook said it was very necessary, as with all machines, to examine bearings carefully from time to time, and see that they were properly oiled and that the oil actually got into the bearings. Where he had been at work in offices he occasionally found great heat in parts of machines, and it had been proven that they were not adequately or correctly oiled, or the oil could not get where it was wanted. Sometimes apparently there were defects in the oil holes of the machine as delivered.

If two-inch runners in their tracks lost a quarter of an inch in diameter, one must expect trouble. When flats developed on the runners and the tracks became stepped, they could no longer get good work.

Back-lash must be expected after long wear. Some corrections or compensations were possible. The stroke could not be shortened in modern wharfedale machines by the old methods, such as moving the rack and working forward correspondingly in a slot. A different method of stroke shortening was possible, however. If stroke shortening was not deemed quite the proper way of expressing what happened, one might adopt different wording, and say that a particular mechanical happening could be made to occur early or made to occur later. Let it be too early, and in workshop phrasing, "it wouldn't take." Let it be too late, and it would "take" with a knock.

A good deal might be done in certain repairings to secure better timing of bed and cylinder, provided always that what was done must be consistent with the pawl dropping into its proper place at every speed at which the machine was worked. Back-lash must be eliminated from intermediate gearing.

Over-packed cylinders got out of step with the bed. It also involved the impression cylinder's pushing the type as well as pressing it; of course, increasing the wear and tear.

The fast and loose wheels on either side of the impression cylinder might tend to be a little out of step. A new Wharfedale was being made in which both fast and loose wheels were on one side of the cylinder. Was it not possible, by the way, to combine in one new type of machine the distinctive features of the two-revolution and of the Wharfedale?

The cam and tumbler of the arm which lifft the laying-on board became worn in time. This might mean a quarter of an inch play between the end of the rod and the rocking arm. The two arms lifting the board, actuated by the rocking arm, became out of adjustment. Result, jerking instead of gliding and instant coming together and instant acting together of parts. There was "knocking" instead of easy fitting co-movement, which finally meant bad register.

To express it another way, there was jar first between the lever and the rocking arm, there was a jar next between the lifting rod and the board, thirdly there was a jar on the other side of the cylinder at the raising of the board.

Re platens, we could not always give them the size of jobs that suited them, but with a very small centre job, bearers could be set in the outer parts of the platen. Failing that, there might develop a tendency to wobble, if there was pretty continuous employment on very small work.

The stop latch, with its radial indicator, should always have most careful attention. Happy-go-lucky inattention to the stop-latch might mean unequal pressure at the two sides of the platen, and then the bar might "kick out."

When platens were being pretty continuously worked with full-sized formes for embossing or printing, one should watch the collar of the eccentric. All eccentrics, all cams, and all the mechanisms that these actuated, should be particularly carefully noted. A small failure of adjustment or contact might make all the difference.

Why was it that in one large printing works which had two factories, he found in the one, old machines, Wharfedale or other, giving admirable service, and in the other factory, machines of about the same age, which were beyond repair? Perhaps that most urgently necessary regular Saturday morning cleaning and tendance had been a practice faithfully observed in the one case and a rule dishonoured in the breach in the other case.

Guillotines were sometimes blamed for defects in their knives, and the knife edge, more than wrong thickness or thinness might be the cause of the trouble. Let the edge be ever so minutely turned inwards, and the paper through which it cut would be spread out at the base.

Speaking of knives, he said that the wear and tear of gravure cylinders appeared to be less than might be anticipated, and for this reason, that the supple steel "doctor" blade did not absolutely clear everything from the surface of the cylinder. It left a very slight film of oil, which only faintly and not at all injuriously marked the paper and which did assist lubrication.

On the wear and tear of type Mr. Colebrook had a good deal to say. In conclusion, he spoke of the wear and tear of the individual.

Mr. Mizen, secretary of the North London M.P.A., and Mr. Whyte, secretary of the London Master Printers' Association, were among those who contributed to the discussion. Rollers had been spoken of, and Mr. Whyte gave his experience that in very warm weather it was well to rely upon sheeting the rollers instead of wetting them.

Thanks to the Lecturer.

Mr. Whyte, too, said he hoped Mr. Colebrook would look after his own wear and tear. He took up everything in the printing world so keenly, and took up so many things, and was involved in so much travelling up and down the country, that he sometimes wondered whether the personal machine in his case might have a somewhat shorter lease of life than otherwise could be hoped for.

The chairman, in putting the vote of thanks, said they hoped to have Mr. Colebrook come again and give another talk.

Gold Inks
(LETTERPRESS)

IF you have never yet tried Gold (Letterpress) Inks or are familiar only with those hitherto obtainable, Lorilleux and Bolton's gold inks will be a revelation to you.

No modern printer keen on cutting costs and speeding up production can possibly afford to ignore the handiness and economy they offer.

The following points show the great superiority of Lorilleux & Bolton's gold inks:—

1. They do not clog or harden on the rollers.
2. Need no specially skilled operator.
3. Are suitable for either platen or cylinder machines.
4. The machines can be run at normal speed.
5. Retain their brilliance for long periods.
6. Print the type thoroughly and heavy solids without difficulty.

Available in light and dark shades of gold as well as silver.

Write for specimen prints and generous sample tin to-day.

LORILLEUX & BOLTON LTD.

Trade Notes.

PARTNERSHIPS dissolved, announced this week, include those between A. E. Lancashire and W. H. Clegg, letterpress printers and bookbinders, 98, Quay-street, Manchester, under the style of The Lancashire Press; W. H. Taylor, the elder, W. H. Taylor, the younger, S. R. Taylor and E. J. Dunmore, printers and wholesale stationers, 30 and 30A, Highgate-road, Kentish Town, London, under the style of William H. Taylor and Sons; F. A. South and F. Rhodes, merchants in wall-paper, paint, varnish and decorators' materials, 1, Nesfield-street, Bradford, under the style of F. A. South and Co.

BRISTOL DISPUTE.—The Conciliation Committee of the Joint Industrial Council was to meet yesterday (Wednesday) to endeavour to settle a dispute in the Amalgamated Society of Lithographic Printers.

HULL PRINTING CONTRACT AND NON-UNION FIRM.—A deputation from the Hull Branch of the Typographical Association waited upon the Hull Corporation Tramways Committee on Monday in reference to a tender for the printing of 60 million tram tickets which had been recommended to be given to the Bell Punch and Ticket Co., Ltd. Mr. Colby, on behalf of the deputation, said this company was a non-union firm who had transferred their works from the London area to Uxbridge, about a mile beyond the London area, and instead of the London wage rate of 89s. they had to pay only 65s. 6d., whereas the Hull rate was 71s. 6d. Mr. Colby informed the chairman of the committee that the Auto Ticket Co. whose tender was second, and Messrs. Harland, of Hull, whose tender was third, were union firms, and on the motion of the chairman the committee decided to divide the contract between these firms. The tender of the Bell Punch Co. was £6,000 for three years, and the additional cost of the new contracts was stated to be £187 10s.

WE understand that a number of meetings of the Special Committee to inquire into State Printing have been held, and that the first official witness examined was Mr. W. R. Codling, Controller of the Stationery Office. The Committee is meeting twice a week, but the proceedings are being conducted in private.

CONFERENCE took place on Tuesday between the Federation of Master Printers and the Printing and Kindred Trades Federation, when the use of time clocks was discussed, the employers' representatives to report fully to the Federation Council. Questions relating to the hours and holidays agreement will also be reported.

A FURTHER conference was held on Monday between the London Master Printers' Association and the National Society of Operative Printers' and Assistants with regard to certain matters affecting assistants. Revised proposals were submitted by the L.M.P.A. but as the employers were unable to consider counter proposals tabled by the Society, the meeting was adjourned, both sides agreeing to report to their executives and ask for further instructions.

FURTHER conference took place on Tuesday between the Federation of Master Printers and the Wholesale Stationers' Association, the question of the supplying of paper for duplicating machines being discussed at some length.

LT.-COL. H. RIVERS FLETCHER paid a visit to the Bristol Master Printers' Association last Thursday and was entertained to lunch, Mr. W. T. Bodey presiding. Col. Fletcher gave an interesting résumé of recent activities of the Federation, emphasising the arising of many labour matters that had to be dealt with, despite the fact that wages had been stabilised until the end of the year. He was accorded hearty thanks for his address.

PRINTERS' MEDICAL AID.—The fifteenth annual report of the Printers' Medical Aid and Sanatoria Association (30, Fleet-street, London—secretary, Mr. Arthur O'Connor) shows an excellent year's record, with growing membership and an increase in benefits conferred. The booklet includes a statement of accounts and a long list of subscriptions (subscribers' names being arranged in not quite alphabetical order). In the extent of the Association's finances and the number of cases assisted, the year 1922 makes a fitting climax to the ever-increasing success of previous years.

PRINTERS VISIT PAPERMILL.—The members and friends of the Liverpool Letterpress Machinemen's Guild, paid a visit on Saturday, June 16th, to the North Wales Paper Company's Mills, at Oakenholt, near Flint. Messrs. L. S. Dixon and Co., Ltd., wholesale stationers, of Liverpool, made all the necessary arrangements for the visit previous to the above date. A party of 182 ladies and gentlemen journeyed to Oakenholt via the Wirral Peninsular, arriving at the Mills at 3.30 p.m., when a thorough, educative and interesting inspection was made. On the proposition of Mr. Dodd (president), seconded by Mr. Houston (hon. secretary), a hearty vote of thanks was proposed to the Manager of the Mills and his staff, for their kindness in having them at the Mill on a Saturday afternoon, also for their hospitality in giving them tea.

THE members of the Yorkshire Newspaper Society revisited Sheffield, after a break of fifteen years, for their annual meeting on Saturday. At the business meeting in the morning, which was attended by representatives from all the leading daily and weekly papers in the county, Mr. G. E. Stembridge (*Sheffield Daily Telegraph*) was elected president for the year, and Mr. Warren, of the *Doncaster Chronicle*, was elected vice-president.

POOL'S Advertising Service Ltd. opened its City office on Monday, at 65, London Wall.

PALMER'S Publicity Service have removed their offices from 132-4, Fleet-street, to larger premises at 69, Fleet-street.

CONSEQUENT on the purchase by the United Newspapers (1918), Ltd., of the Salisbury Hotel, Salisbury Square, the site of 72-79, Fleet-street, and 2-3, Salisbury court, has come into the market.

LEWISHAM Council has defeated a motion to use the backs of rate receipts for advertisements.

THE late Mr. Aubyn B. R. Trevor-Battye, of Petersfield, Hants, formerly editor and proprietor of the *Artist*, left £4,340.

THE death has occurred of Mr. G. F. W. Brendon, London representative of Messrs. Cahill and Co., Ltd., Park Gate Printing Works, Dublin. Deceased who was known and respected in London printing and publishing circles, succumbed to an operation for appendicitis.

MR. RICHARD E. JONES, head of the famous catering firm, who died suddenly last week, was, thirty-four years ago, a compositor on the *Western Mail* at Cardiff. He begun business as a caterer in a very small way, and later founded the company of R. E. Jones and Co., which in 1920 had an authorised capital of £1,000,000.

ROCHDALE and District Printing Trades Guild have organised a knock-out competition for the cricket shield presented by the local Master Printers' Association.

PAPER EXAMINATION SUCCESSES.—The following successes were obtained in the paper examinations held by the Stationers' Company and Printing Industry: First Class, C. W. James, T. Lowe, L. A. Tanner; Second Class, R. J. Baines, A. H. Cook, A. R. Emerson, F. W. Goldsmith, C. Kelleher, A. P. Pritchard, J. W. Tilley, F. Veitch, E. D. Walton.

A FEDERATION of Master Process Engravers has just been formed for Australia.

OUT of the 32,590 factories and works in New York, 3,316 are devoted to the printing and publishing industry.

ON the occasion of the annual meetings of the papermakers at Dresden, the *Papierfabrikant* has issued a special number, 23A. It is intended largely for circulation abroad and the abundant and well-displayed advertising matter shows how ready the Germans are to take advantage of such opportunities. A special feature of the issue is the advertising enterprise of the papermakers. The matter is printed on about twenty different samples of paper, each bearing a description of the paper and the name of the manufacturer. They range from a green cloudy cover through printings, writings, vellum (Japanese imitation) to deeds. This number also contains interesting and useful articles on "Raw Materials," "Bleaching with Gas and with Powder," "The Cause of Strength in Kraft Paper," "Pulp from Reeds," 'Deterioration of Pulp Wood and Its Prevention," "Straw Paper," "A Study of Machine Wires," "Heat Economy," "Electrically Heated Cylinders," etc. It is published by the Otto Elsner Verlagsgesellschaft m.b.H., Berlin S42, Oranienstrasse 140-42, and can be had for 1s. per copy.

Trade Union Matters.

MR. F. O. ROBERTS, M.P., at a dinner of the Midland Group branches of the Typographical Association in Nottingham, on Saturday, alluding to the grading system now in existence in the trade, said that employers would be well advised to listen to the suggestions that the men's representatives were making.

FITTERS AND LINOTYPE SLUGS.—The Executive Council of the Typographical Association, after consideration of an inquiry as to whether it was permissible for a linotype fitter to cut slugs to be used in spacing out matter, have directed the branch in question that they cannot sanction such work being done by fitters.

TYPOGRAPHICAL ASSOCIATION AND STRIKE PENALTIES.—A point of much importance as affecting the agreement of last August following the dispute in the printing trade, has arisen at Newcastle-on-Tyne. One of the clauses of the agreement was that no member of the Typographical Association should be expelled because of his action during the dispute. The Newcastle branch secretary, in a communication to the Executive Council of the Association, forwards a letter from a member raising the point whether he can be expelled for refusing to pay a fine imposed because of his action during the dispute. The Executive Council announce that, in the absence of an appeal against the fire, they see no reason to interfere with their previous warning against expulsion in the event of the fine not being paid.

PRINTING AND KINDRED TRADES' FEDERATION.—This Federation has issued its annual report, for the year 1922, in a substantial pamphlet which not only reviews the Federation's work and the principal events of trade union interest during 1922, but includes also an extensive report of the Scarborough conference of April last. The report states: "The total income of the Federation for the past year, amounting to £10,455 4s., is £483 0s. 7d. less than that of the preceding year, and indicates a slightly reduced membership in several of the affiliated unions. Considering the state of trade, we congratulate affiliated unions that their membership has been so well maintained. The income over expenditure shows a gain of £4,905 11s 1d., which is less by £163 6s. 3d. than for the previous year." Following a reference to the the work of the Joint Industrial Council, comment is made upon the honour conferred upon its present chairman, Mr. H. Skinner. "At a time," it is stated, "in the affairs of the industry when relations were very strained as between the Employers' and the Workers' Panels, Mr. Skinner's name was proposed from the employers' side as the chairman for the twelve months from July last—a sure indication that both sides recognised the personal merit of our colleague, notwithstanding the pressing events with which he was officially concerned."

POST OFFICE SURPLUS.—The Postmaster General, reviewing in the House of Commons on Tuesday the year's work of his Department, stated that the Post Office had made an unexpected profit of £2,500,000, the total surplus being about £5,500,000. With regard to reductions of postage, he said it had been thought that these would be met by increased business, but this anticipation had so far been fallacious. On the reduced rate on letters it was estimated there would be an increase in volume of 10 per cent., but the actual increase was only 4 per cent. On postcards the estimated increase was 20 per cent, but the actual only 5 per cent. In printed matter the reduction in charges was estimated to lead to an increase of 20 per cent., but in this case the actual increase was 25 per cent. That increase, he said, was "due largely to a great fall in the cost of printing." Commenting on the Postmaster-General's statement, Mr. A. E. Goodwin (secretary, Federation of Master Printers) remarked that the reasons given for not making further postage reductions did not appear conclusive. The main fact, he said, would not be overlooked that there was a surplus, and, as has always been maintained, such surplus should be used for improving the postal service and should not go to the reduction of general taxation.

AT Birmingham Assizes on Friday, judgment was given for Messrs. Moody Brothers, printers, in an action for alleged libel brought by Messrs. E. and L. Bucknell.

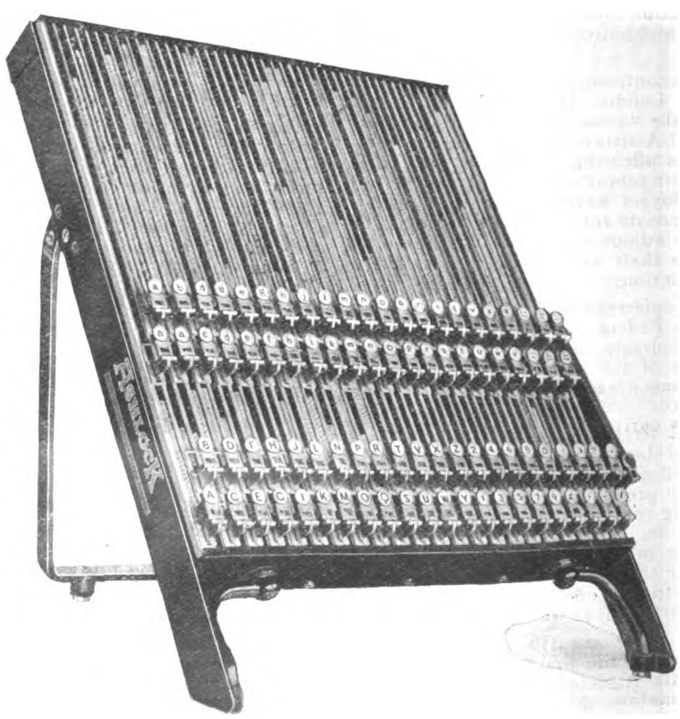
A Printing Plant in Miniature.

The Ashlock Equipment.



We are able to illustrate herewith one of the most interesting of recent additions to the ranks of apparatus designed primarily for home and office use in the production of printed matter. Whilst some printers regard such machinery merely as setting up competition with printing proper, other printers have taken the bull by the horns and have themselves installed machines of this class for use in small runs of memos, circulars and other matter where the customer's primary consideration is cheapness of price and the cost of printing in the ordinary way would be prohibitive. Whichever view be taken as to the proper attitude in this matter, the particular apparatus here shown is of intrinsic interest to printers as a piece of printing mechanism.

Ashlock Printing Press.

The first illustration shows the Ashlock Printing Press with forme of type in position ready for inking. After the frame-work, which folds down, has been properly erected, one can proceed to work up the ink for the job in hand. Though not all visible in our illustration, there are four inking rollers and one pressure roller, and after ink has been placed in the duct the final inking roller is properly charged with ink by the simple process of moving up and down the handle (the horizontal bar seen in front of the machine), this lifting and lowering motion, through a distance of about four inches, being repeated 15 or 20 times. Next, the chase is dropped into position as shown, and printing can be commenced forthwith. To proceed, the handle is raised to above the top of the press, and in doing so the inking roller automatically comes into place and inks the forme. At the end of the upward stroke the inking roller is tripped out of operative position and the pressure roller comes into place, so that, after the insertion of a sheet of paper, the downward stroke completes the printing. The paper is inserted under the gripper plate (bearing the name "Ashlock") at the top of the machine. This plate lifts at the completion of the upward movement of the handle, to allow a sheet to be slipped into position against guides, shutting down so as to grip the paper when the downward movement begins. The "Ashlock" press prints from type, line blocks or stereos, has a maximum type area of 7½ by 5½ ins. and takes a sheet of paper 10 by 8 ins.

Of much interest also is the special "type setter" shown in our second illustration. This apparatus is supplied with every "Ashlock" press and greatly facilitates the setting of type for use in the forme. In the vertical grooves seen in this type setter, ordinary printer's type is inserted, the various sorts being in ordinary proportions. Any piece of type required is picked up with great ease, as a touch of the finger upon the little button bearing the necessary character results in the type being projected (though the slot seen below each button) for withdrawal by finger and thumb. By inserting the supplies of type into the grooves in such fashion that the nicks face uniformily in one direction, the operator picks up each stamp in right position for quick setting.

Ashlock Type Setter.

The whole of the "Ashlock" apparatus appears to us to be well constructed and cleverly designed to facilitate rapid operation by unskilled workers. We say this after personal inspection, our inquiries in the matter having been met by a most thorough and courteous demonstration of the apparatus under ordinary working conditions.

The "Ashlock" system can be seen in practical application at the offices of Messrs. Ashlock Limited, 57, Carter-lane, London, E.C.4.

Postage of Printed Matter.

To *The Times* of Friday last the following letter was contributed by Lieut.-Colonel H. Rivers Fletcher, president of the Federation of Master Printers:—

"The glaring disparity between the cost of posting printed matter from the Continent and from England was very forcibly brought to my notice yesterday. In the morning a customer handed me a circular which he had just received from a Berlin printer extolling the facilities of his press and boasting of the large contracts he has in hand for this country. I will only quote one of the advantages he offers: 'Postage for printed matter to abroad from July 1st, 1923: 50 grammes' only 160 mark. Calculate this in your currency! Such dispatch by post is not subject to Customs duty.'

"In the afternoon I was given a current 1,000 mark note on the back of which was printed an advertisement of a local flower show. Such notes had been given away in thousands, and had cost the show committee less than ¼d. each. Yet each of them would buy six 160 mark stamps—twelve circulars carried from Germany and delivered by our Post Office for ½d., which latter, as we all know, is the minimum rate of postage in this country. Surely the need is urgent for expediting the reforms which the Postmaster-General has promised to bring into force."

INCOME-TAX—TABULAR VIEW, 1842-1924.—The success which has attended the previous editions proves that the "Tabular View" meets a real and felt want. The aim is to present the income-tax and super-tax positions in an intelligible and, as far as possible, tabular form. The subject has become so complicated that it requires an expert to understand even ordinary books dealing with it. This publication is designed to remove that difficulty, and to serve the purposes of both experienced and inexperienced people. This is done by eight carefully compiled tables. All the various heads of abatement are tabulated with their conditions and money value, and in this, as in all other respects, the particulars cover all the points up to date, including this year's Budget.

Australian Notes.

Broadcasting News—Change in Directorship—Fire at Sydney—Printing Trades Union to Carry On—New Companies.

(From Our Sydney Correspondent.)

INTERESTING proposals regarding broadcasting in Australia were made at a recent conference at Melbourne. Mr. Gibson, the Postmaster-General, in opening the conference, said that although the area of Australia was twenty-five times that of Great Britain the population was only an eighth of that of the Mother Country, this would possibly make the difficulties comparatively twenty-five times as large and the number of contributions eight times as small. Broadcasting would be used in the first place for transmitting news, the Press would, however, be adversely affected, and news would have to be safeguarded. During the subsequent discussion it was stated that a regulation will be made that news must be bought and paid for before being broadcasted.

MR. ROBERT SANDS, who has for about forty years been a director of the *Sydney Daily Telegraph*, has resigned owing to ill health and has been replaced by Mr. J. L. Wallace, the managing director of the Sydney and Melbourne Publishing Co., Ltd.

CONSIDERABLE damage has been caused by fire to the premises of Mr. C. Jerrom, bookbinder and manufacturing stationer, Kent-street, Sydney.

AT a recent mass meeting of the Amalgamated Printing Trades Union it was shown that although the Union has lost its registration as an industrial union it remains a live and active trade union and there has been no falling off in membership as a result. The policy of resistance to possible attacks on wages and hours or conditions was unanimously confirmed.

MESSRS. THORNTON, HAMILL AND WINTER, LTD., have been registered as a company with a capital of £5,000, in £1 shares, as printers, publishers and stationers, Castlereagh-street, Sydney.

MESSRS. LAMSON PARAGON, LTD., have declared an interim dividend at 10 per cent. per annum for the six months ending April 30th last.

MESSRS. THE ASSOCIATED ADVERTISING SERVICES (OVERSEAS) has been registered with an authorised capital of £5,000, to carry on the business of advertising experts, writers, publishing agents, etc., at Sydney, N.S.W.

THE Cessnock Publishing Co., Ltd., has been registered with a capital of £10,000 to acquire all rights and interests of the *Cessnock Express*, to carry on the business of proprietors and publishers of newspapers, journals, literary works, etc., and to publish the *Cessnock Express*.

MESSRS. SMITH'S NEWSPAPERS, LTD., has been registered in N.S.W. with a nominal capital of £400,000 in £1 shares, to acquire the business now carried on by *Smith's Weekly* Publishing Co., Ltd.; to start, acquire, publish and circulate or otherwise deal with any newspaper or newspapers or other publications, etc.

THE Triad Magazine of Australia, Ltd., has been registered with a capital of £15,000 in 5,000 preference shares of £1 and 10,000 ordinary shares of £1; to purchase and continue as a going concern the *Triad Magazine* and other publications lately carried on by the Triad Magazine Ltd.

MESSRS. BERNICE AGAR, LTD., has been registered with a capital of £3,000, to acquire as a going concern, the business known as Bernice Agar, together with all assets and liabilities, and to carry on the business of photographers, photographic agents, printers, lithographers, engravers, etc.

MESSRS. W. J. CRYER AND CO., LTD., has been registered with a capital of £15,000, to acquire a certain business and carry on the business of printers, engravers, publishers, book and print sellers, bookbinders, art journalists, newspaper and magazine proprietors, newsagents, etc.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies, Machinery for Sale and Wanted, Businesses for Sale and Wanted, Partnerships and Investment, Miscellaneous.

One Insertion 3/0
Three Insertions 6/0
For every line exceeding three lines 1/.

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion 1/6
Three Insertions 3/0
For every line exceeding three lines 6d

Sales by Auctions, Tenders, Patents for Sale, Legal and Financial Announcements

Per line 1/0

Replies may be addressed to Box Numbers. Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C.4, for which a fee of 6d. is charged to cover Postage of Replies.

Cheques and Post Office Orders to be crossed and made payable to STONHILL & GILLIS.

Telegrams: Stonhill, Lud. London.
Telephone: 8407 City.

Situations Vacant.

County Council of the West Riding of Yorkshire.

APPLICATIONS invited for the position of Junior Assistant in the Stationery Section of the Council's Central Stores Department. Candidates must have a fair knowledge of scholastic stationery and allied trades. Application forms can be obtained from the Stores Manager, Cliff-lane, Wakefield. (Addressed and stamped foolscap envelope must be sent for reply.) Forms must be returned by Tuesday, August 28th. 14206

SUBSCRIPTION CANVASSER wanted for old-established Printing Trade Journal.—Reply, in first place, to Box 14162.

Situations Wanted.

ASSISTANT NEWSPAPER PUBLISHER, Young Man, fully qualified and experienced, desires change, or as PUBLISHER to any reputable Paper; full details.—Write, W. M. Fortescue, 26, Cardiff-road, Llandaff, Cardiff. 14216

BINDER, Loose-Leaf Account Book, wants situation; all-round hand.—J. G. S., 68, Baxter-road, N.1. 14209

BOOKBINDER.—Practical man, with 20 years' experience in all branches, desires position as Foreman or Deputy Overseer; good references.—Box 14208.

FOREWOMAN (PRINTERS) d sengaged; experienced, energetic and reliable; highly recommended.- R. L., 3A, Brondesbury-road, Kilburn, N.W. 14214

OVERSEER LETTERPRESS MACHINE (38) seeks change; London or South of England; keen, practical and progressive; costing.—Reply, M., Box 14199.

READER (n.s.) open for engagement; experienced General Jobbing, Catalogue, Government and Book Work; preference for country.—Box 14213.

S.O.S.—PRESS TELEGRAPHISTS require work (knowledge also Wireless and Postal Telegraphy).—Martin, 105, Helix-road, Brixton Hill, S.W.2. 14215

THE PRINTERS' PROVIDENT ASSOCIATION, 39-40, Shoe-lane, E.C.4, is able to supply ALL CLASSES of EFFICIENT LABOUR for the Printing and Allied Trades at short notice; no charge.—Phone, Holborn 527. 14180

YOUTH desires Apprenticeship either in Litho or Letterpress Machining, or in Stereo Foundry; intelligent; C.C.S. scholar.—G. A. Rutherford, 39, Moselle-avenue, N.22. 14126

Tenders.

BISHOP-MAYOR,
BOROUGH OF FOLKESTONE.

The Corporation do not bind themselves to accept the lowest or any tender.

A. F. KIDSON,
Town Clerk.

Town Clerk's Office,
Folkestone.
23rd July, 1923. 14212

Agencies.

CONTINENTAL firm of Paper and Printing Machinery Manufacturers desires to GET INTO TOUCH with British firm who could handle their production in England, either as Sole Agents or Merchants buying for own account.—Reply, giving full particulars, to Box 14160.

Partnerships and Financial.

BOOKBINDERS.—Wanted, WORKING or SLEEPING PARTNER in Wholesale Cloth Bookbinders; half share "Sleeping," good interest.—Box 14211.

Machinery for Sale.

LITHO MACHINE (Double Crown), splendid condition, "Newsum," will be sold very cheap to clear. Apply, Box 14202.

SMYTH-HORNE, LTD.,
1-3, Baldwin's-place,
Gray's Inn-road, London, E.C.1.

Occasionally we have Rebuilt Smyth Book Sewing Machines to offer, such Sewers having been thoroughly overhauled and refitted with New Standard Parts where necessary. We erect and teach on a trial basis.—Box 13993.

Miscellaneous.

THREE Young, Energetic PRINTERS, practical, wish to TAKE OVER PLANT by arrangement; Plant must be in or near City.—Reply to "Printers," care Elldeeco Publicity Service, Pancras Chambers, 90-91, Queen-street, London, E.C.4 14210

WASTE PAPER: ITS RECOVERY AND RE-MANUFACTURE. By Jas. Strachan. A Fund of Information; price 12s. 6d.—Stonhill and Gillis, Publishers, 58, Shoe lane, London, E.C.4.

Paper Market in China.

Opportunities for Outside Suppliers.

Mr. Yoko-Take, Commercial Commissioner stationed at Shanghai, has recently issued a report on the paper industry of China, and some of his conclusions are interesting. He refers to the long history of native paper manufacture and remarks that its progress is slow. This is attributed to poor material and relatively bad water supply. Moreover, the Chinese are very conservative and are reluctant to study scientific methods.

One reason for the slow progress of the Chinese paper industry is lack of capital. Supplies of rags are apparently abundant, while other countries are able to supply wood pulp.

On'y in strawboard is there a possibility of development, with supply centres all over the country. To sum up, the report states there is little possibility of development in the papermaking industry of China by machine in the near future. At the same time culture and civilisation in the country are making great strides year by year, which will naturally result in an increased demand for machine-made paper from abroad.

A VERY acceptable present of a four-valve wireless set to the Caxton Home, Limpsfield, has been made by Mr. Geo. C. Josland (trustee), on behalf of the South London Caxton Musical Society. The gift was handed to the Secretary of the Home on Saturday last, and duly installed in the afternoon. It will keep the patients in touch with daily events, and add much to their enjoyment during their term of residence.

United States—LOCKWOOD TRADE JOURNAL Co., 10 East 39th-street, New York.
Representatives also in Australia, India, South Africa, Canada, etc.

THURSDAY, JULY 26, 1923.

The Art of the Book.

IN many directions good work is already being done to encourage the artistic side of the several crafts that are involved in book production. There is yet room, however, for further provision of incentives to excellence of artistic craftsmanship, and room also for further opportunities for the display of the products of ambitious workers in order that the ability shown may be turned into useful and remunerative channels. The Royal Society of Arts scheme, dealt with on another page, is therefore to be welcomed, and the thanks of the trade are due to those who come forward with donations of money to assist this commendable effort to improve design in respect of book production.

* * *

Art and Appreciation.

COMPETITIONS and exhibitions arranged for the encouragement of artistry are not only of use to the particular craft concerned, but must also have a beneficial effect upon public taste generally. There is a big need for more intelligent appreciation by the man in the street of the artistic qualities of books and other printed matter, and not enough is done to educate taste in this direction. Something can be achieved by the supplying of articles on craft subjects to the non-technical press, also by the use of the new medium of addresses broadcast by wireless. The first step in the use of British wireless for the dissemination of information on book production was made recently by a bookbinder, Mr. E. J. W. Zaehnsdorf, and doubtless there will be printers following suit. We learn from Kansas, U.S.A., that a college professor of that city recently gave an address by radio in which he made a commendable appeal for greater appreciation of the printer's art. In the course of his talk the professor is reported to have said: "For those who get beauty from the common things of life there is a constant source of interest in printed material. This is true because there is art in typography. A good piece of printing is more than a mere mechanical vehicle for the carrying of an advertising message or the recording of human findings. It is an artistic creation worked out by human devices. It is wrong to judge the typography of an advertisement or a job of printing by whether it grips a reader's attention. It is the easiest thing in the world to attract attention, but it takes a real typographer to create a piece of printing that will arouse a favourable response in feeling or action in those who see it."

* * *

The De La Rue Dispute.

THE recent ending of the long-drawn-out dispute in which the firm of De La Rue has been involved with the Papermakers' Union leaves us with mixed feelings. One feels the usual relief that follows settlement of a conflict which inflicts loss upon all participants without adequate benefit to any, and one cannot also but reflect that the dispute has provided, on the union side, an example of tactics which do not show due regard for the stability of the printing industry. A little more wisdom and a little less intractability would, we think, have saved the union a great deal of money, and have better served the interests of its members by settling the dispute earlier and on terms more satisfactory to the union. Credit is due to Mr. T. E. Naylor and Mr. Woodgate Stevens for the assiduity with which they sought for, and eventually secured, a settlement.

* * *

Paper to Suit Type.

PAPER merchants who make it their business to keep in touch with developments on the printing side will not fail to observe the reaction toward mediæval type faces. The best printing offices are reverting to 15th century principles in type, display and make-up, for much of their work. Naturally mediæval crudeness is replaced by present-day mechanical perfection. There is an element of weakness, however, when old style treatment is meted out on downright modern-looking paper, and that is what is happening in a good many instances. There are, of course, several types of paper on the market that fit in with the old-style character very well. But there is an opportunity for the papermaker or merchant to link himself up more closely with the better side of the printing trade by catering exactly to their requirements. Tone, texture and watermark might be studied with advantage. For real *de luxe* issues the printer need look no further than our hand-made mills. Without mentioning names, there are at least two of them at which antique deckle-edged laid printing papers are produced, with all the 15th century character embodied in them.

* * *

Vegetable Parchment Shortage.

BELGIAN mills require three months and upwards for the delivery of vegetable parchment made to order. The demand is well in excess of the supply, and prices are firm and hard in consequence. Naturally enough, the question arises: why do not English mills take up the manufacture of this specialised product? The trade is extensive, regular and remunerative. There is at least one Scottish mill that has mastered the intricacies of the parchmentising process. During and immediately after the war, when Belgian supplies were cut off, America entered the V.P. industry, and though much of the paper imported fell considerably below the required standard, there was at least one mill that made a success of the enterprise. Eventually the recovery of the Belgian mills put an end to U.S.A. participation in European business, but left the U.S.A. mills in possession of a good market at home.

Trade Wedding at Otley.

Union of Two Famous Firms.

A wedding of great interest to the printing trade was celebrated at the Otley Parish Church on Wednesday, the 18th inst., when Mr. Alec Kenneth Dawson, second son of the late Mr. W. H. Dawson and Mrs. Henry Bey, Maple Bank, Otley, and a director of the firm of Messrs. Dawson, Payne and Elliott, printers' engineers, Otley, was married to Miss Lesley Mary Waite, only daughter of Mr. and Mrs. F. Waite, Inglewood, Otley. The bridegroom is a great-grandson of the late Mr. William Dawson, the founder of the Wharfedale printing machine industry, and the bride is the great-granddaughter of the late Mr. David Payne, the inventor of the Wharfedale printing machine. Her father is head of the firm of Messrs. Waite and Saville, printers' engineers, Otley. The ceremony was performed by the Rev. Canon R. P. Hadland, vicar of Otley.

The bride, who was given away by her father, looked charming in a gown of silver tissue, embroidered with sprays of blossom, with an underskirt of silver lace. The head-dress was of silver foliage and orange blossoms, over which was worn a Brussels net veil, which hung gracefully over a train of silver tissue, lined with shell pink ninon. She carried a sheaf of Madonna lilies, which, along with a diamond and sapphire ring, the gift of the bridegroom, completed a beautiful and distinctive toilette.

There were four bridesmaids—Miss Marjorie Holroyd, Miss Kathleen Dawson (cousin of the bridegroom), Miss Phyllis and Miss Kathleen Barker (cousins of the bride). They were all dressed alike in dainty gowns of shell pink georgette, and wore hats of hand-embroidered lace with four points of lace, bearing silver streamers caught on the brim with a bunch of pink rambler roses, and trimmed with pink georgette. They carried bouquets of pink roses, and wore gold wristlet watches, the gifts of the bridegroom.

Master Billie Thompson, of Harrogate, a nephew of the bridegroom, was the page and train-bearer. He wore a suit of pink *crêpe de Chine*, and a gold wristlet watch, the gift of the bride.

The mother of the bride, Mrs. F. Waite, wore an elegant gown of heavily embroidered georgette, in tones of grey. Her crinoline picture hat was trimmed with ostrich feathers, shaded to match, and she carried a bouquet of yellow roses. Mrs. Henry Bey, the bridegroom's mother, was attired in a gown of black Milanese satin beauté, with embroidery of gold, and a wrap and hat *en suite*.

Mr. Guy Dawson, brother of the bridegroom, acted as best man, and there were four groomsmen—Mr. Vernon Dawson (brother of the bridegroom), Mr. Allan Dawson (cousin), Mr. Rupert Payne (uncle of the bride), and Mr. Frank Whyte (cousin of the bride).

After the ceremony there was a recetipon at Inglewood, the residence of the bride's parents, after which the newly-married pair left for a motoring tour in the Lake District and Scotland.

The bride's present to the bridegroom was a fitted travelling case. The staff of Messrs. Waite and Saville gave the bride a suitably inscribed silver tea service, and the employees of the same firm presented her with a Jacobean grandmother's clock, and Mrs. Waite with a bouquet of flowers. The bridegroom was also the recipient of several presents from the staff and employees of the associated firms with which he is connected.

This wedding signifies the re-union, after the lapse of well over half a century, of the families of Dawson and Payne. The two great-grandfathers of the bride and bridegroom—Mr. David Payne and Mr. William Dawson—became associated in 1850, when Mr. Dawson, who at that time was in business as a joiner, took Mr. Payne into his employ. Together they sowed the seeds of the printing machine industry in Otley, and in 1863 Mr. Payne was taken into partnership, along with Mr. Dawson's elder son—Mr. Thomas G. Dawson—and the firm continued to flourish for three years as Dawson, Payne and Co. A division arose, however, in 1866, and the partnership was dissolved. Within recent years there has been a fusion of the two firms, along with that of Messrs. Elliott and Co., but not until last week were the direct descendants of the two families united by ties of marriage.

Personal.

LORD BURNHAM has been elected vice-president of the Royal Sanitary Institute.

LADY BADDELEY and Lady Tuck will be amongst the stallnolders at the bazaar to be held at Claridge's on November 28th and 29th, in aid of the Queen's Hospital for Children.

AMONG those who attended the annual banquet given at the Mansion House on Tuesday night to the bankers and merchants of the City of London were Alderman Sir George Truscott, Sir John and Lady Baddeley, Alderman Sir Vansittart and Lady Bowater, Sir Percy Simmons, Sir William and Lady Waterlow, and Mr. Sheriff Killik.

TO COMMEMORATE the services of Alderman Sir John Baddeley as Lord Mayor of London in 1921-22, a massive silver rose bowl with four silver flower vases, all inscribed, have been added to the City plate at the Mansion House.

SIR WILLIAM and Lady Berry gave a garden party on Saturday at their residence, Barrow Hills, Long Cross, Chertsey, to several hundred representatives—and relatives—of the numerous departments comprised in the group of undertakings controlled by Sir William and his brother, Mr. J. Gomer Berry.

MR. WICKHAM STEED, lately editor of *The Times*, is writing his memories as a journalist. The book will appear in the autumn through Heinemann, and in America through the allied house of Doubleday.

MR JOHN WALTER, who has been on a visit to South Africa, sailed from Cape Town for England on Saturday in the s.s. "Armadale Castle."

MR. C. W. BOWERMAN M.P., is to preside at the annual meeting of the Printers' Medical Aid and Sanatoria Association to be held on Friday next at 7-9, St. Bride-street, at 6.30 p.m.

MR. W. R. CUMMINS, Muswell Hill, hon. treasurer of the North London Master Printers' Association, whose hobby is gardening, has secured at local flower shows this summer seven first prizes, three second, three third, a silver challenge cup for a collection of hardy flowers and an award of merit for a collection of violas, not for competition.

MR. T. P. O'CONNOR, although he is 75, is busy at work on plans for a new journal which he hopes to bring out in the autumn.

LEEDS University Court has decided to confer the honorary degree of master of arts on Mr. Frederick Peaker, president of the Institute of Journalists and a member of the old Leeds School Board.

THE deputation from the Empire Press Union which waited upon the Postmaster-General on Monday, at the General Post Office, to urge the importance of securing adequate Empire wireless communication included Lord Burnham, Mr. Theo. Fink (Australian Press), Mr. J. P. Collins (*Cape Times*), Mr. G. F. Hamilton (secretary, Exchange Telegraph Co.), Mr. J. B. Hobman (*Westminster Gazette*), Sir Roderick Jones (Reuter's), Mr. Thomas Marlowe (*Daily Mail*), Mr. T. W. McAra (secretary, Newspaper Proprietors' Association), Mr C. R. C. Nixon (Calcutta), Mr. Ernest Perris (*Daily Chronicle*), Mr. H. C. Robbins (Press Association), Mr. T. S. Townend (*Melbourne Argus*), and Mr. H. E. Turner (secretary, Empire Press Union).

MR. ALFRED CRABTREE, who for 14 years has been editor of the *Spalding Free Press*, and has 43 years' service with that journal, and Mr. Samuel Jepson, the chairman of the company, announce their retirement from office at the end of October. Both will continue on the board of directors.

CAPT. E. H. ROBINSON, who won the King's Prize at Bisley on Saturday afternoon, is a journalist by profession and is editor of the *N.R.A. Journal*.

A MOVEMENT is afoot by the Associated Booksellers of Great Britain and Ireland to make in September a presentation to the Association's late president, Mr. H. W. Keay.

MR A. CHADWELL, who is still president of the Electrotypers and Stereotypers' Managers and Overseers' Association (not past president as stated in our last issue), continues to make progress. He is now recruiting on the Norfolk Broads, and hopes to be back for the reunion meeting of the Association in September.

MR. TIMBERLAKE, the South African representative of John Dickinson and Co., has been paying a visit to Canada, and after a trip to the United States will return to Cape Town *via* England. Quite recently Mr. Timberlake had visited Australia and New Zealand.

Printers' Managers and Overseers ASSOCIATION.

Manchester's Annual Ladies' Day.

July 21st was the annual ladies' day of the Manchester Centre of the P. M. and O. A., when 46 members and friends travelled to St. Annes-on-Sea in glorious sunshine. Mr. and Mrs. Ellis welcomed the party on arrival and conducted them through the beautiful Ashton Gardens where luxurious roses perfumed the atmosphere.

Several professional bowlers picked up some "mugs" on whom to practice for the Seeley Cup, but the results showed that the "mugs" had mugged the professionals.

The salmon tea served in the Ball-room of the Palace Cinema and Cafes, Ltd., was a feast that made everyone contented with the world. President Robinson congratulated those present on the long journey they had undertaken to knit closer together the bonds of friendship, and he specially mentioned Mr. and Mrs. Ellis for their excellent arrangements for the pleasure of all. Vice-president Scouler, Messrs. Nuttall, McVay and Garrett also added their testimony.

On August 11th, the teams from Manchester and Liverpool meet at the Bear and Staff Hotel, Gateacre, to contest for the Seeley Cup.

On September 8th, the members' handicap will take place at the Bull's Head Hotel, Hale Barns, when prizes for the members will be presented by President Robinson and Mr. J. Clarke (Blackpool). Mrs. Robinson will give a prize for the winner in the Laides' Competition.

WEE MAC.

Printers' Managers in South Africa.

New Association Formed.

Printers' managers and overseers in this country will learn with interest of the formation—as announced in the *South African Printer and Stationer*—of a new association, "The Printing Managers', Works Managers' Overseers' and Foremen's Craft Association" in Capetown. This is the first launch of the kind in South Africa.

A meeting, consisting of printing executives, was called by Mr. F. W. Ingram, manager of the Citadel Press, who has been very keen on starting such an association in South Africa. At the meeting it was unanimously agreed to form an association on the same lines as had proved so successful in other countries.

Its objects are:

The study of the principles of the craft, and the furtherance of the best methods for the production of printed matter; the mutual improvement of the members as craftsmen; the furtherance of social intercourse amongst the members.

The following gentlemen were duly elected to control the affairs of the Association for the first year: President, Mr. G. Treadwell, Argus Co; vice-president, Mr. F. W. Ingram, Citadel Press; secretary-treasurer, Mr. R. Bell, Citadel Press; committee, Mr. F. Sparham, H. H. Taylor and Co.; Mr. W. G. Monnery, Van de Sandt de Villiers Printing Co., Ltd.; Mr. J. Drummond, Wilkinson and Co.

CLOISTER PRESS, LTD. (Heaton Mersey, near Manchester).—Issue on June 30th, 1923, of £900 debentures, part of a series already registered.

ASPLEY COLOUR PRINTING CO., LTD. (Nottingham).—Satisfaction in full on June 25th, 1923, of mortgage debentures dated September 15th, 1903, and November 29th, 1904, securing £2,500.

RICHARDSONS PRINTERS, LTD. (Grimsby).—Debenture dated July 2nd, 1923, to secure £750, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: E. B. Chapman, "Gwyhfa," Mill-road, Cleethorpes, Lincs.

SYDNEY LEE (EXETER), LTD. (calendar printers, etc.).—Particulars filed of £2,500 debentures authorised June 9th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital; the whole amount being now issued.

HENRY GARNETT AND CO., LTD. (printers, newspaper proprietors, etc., Rotherham).—Satisfaction in full on June 28th, 1923, of debentures dated December 8th, 1908, securing £1,000.

"DAILY NEWS," LTD.—Satisfaction in full on July 5th, 1923, of charge dated August 17th, 1921, securing a sum not exceeding £50,000.

DAVENPORT AND KING, LTD. (printers, bookbinders, stationers, etc., Blackburn).—Satisfaction in full on July 7th, 1923, of mortgage dated August 5th, 1920, securing £1,000.

W. H. VEALE, LTD. (printers, etc., Great Yarmouth).—Debenture dated June 30th, 1923, to secure £2,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C.2.

JACKSON, HARTLEY AND JACKSON (1922) LTD. (paper merchants, etc., London).—Particulars filed of £3,000 debentures authorised June 14th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital; the whole amount being now issued.

HEAD WEIR PAPER MILLS, LTD.—Mortgage dated July 2nd, 1923, to secure £22,154, charged on Head Weir Mills and Hutch Mills, Bonhay-road, Exeter, machinery and certain water rights. Holders: E. S. and A. Robinson, Ltd., 1, Redcliffe-street, Bristol.

State Printing Losses.

An Example of Waste.

The trading accounts and balance-sheets with the report of Sir Malcolm G. Ramsay, Auditor-General, recently published, should have been studied more closely by those who took part in the recent debate on Socialism in the House of Commons. The number of experiments in State trading which have proved complete failures are fully set forth in this report. Special attention, however, needs to be called to the remarks of the Auditor-General on the State printing works.

There is a loss of £13,481 shown at the Hare-street Works, and a loss of £21,093 at the Harrow Printing Works, but these two amounts do not by any means represent the actual loss to the State.

The Auditor-General calls attention to an expenditure of £1,260 paid for revaluation of the plant being added to the value of the plant! But a more significant fact mentioned is that the system of competitive tendering had been abandoned, because it was likely to result in a very uncertain and irregular assignment of work to the Harrow State Printing Works—in other words, that as private firms were prepared to do the work cheaper than the State printing works, the work should therefore not be put up to competition, but assigned to Harrow in quantity sufficient to keep the works fully employed.

It must be obvious to everyone that if a works is not kept well supplied with orders it cannot show as good results as if it were always fully employed, but if any concern is allowed to charge out its work on a non-competitive basis, how is it possible to judge whether or not it is being run on sound economical lines?

The Auditor General remarks on the fact that the charges for work for certain public institutions did not cover the cost, and adds that work for outside bodies should be charged at rates sufficient to cover the cost. Surely the question arises as to why the State printing works is doing work for any outside public bodies.

Fortunately, the Government has set up an inquiry into the whole question of State printing, but until the Committee has made its report there should be no extension of activities in this direction. Mr. Amery, First Lord of the Admiralty, spoke with no uncertain voice in the debate on the 16th instant on the importance of the factor of efficiency in private enterprise in keeping a business up to the highest pitch, and said that once people were in the service of the State they were subject practically to no test of efficiency.

Why, then, is the Admiralty embarking on the very doubtful experiment of starting its own printing works to produce charts, etc., which have hitherto been produced economically and efficiently by private enterprise?—*Financial Times.*

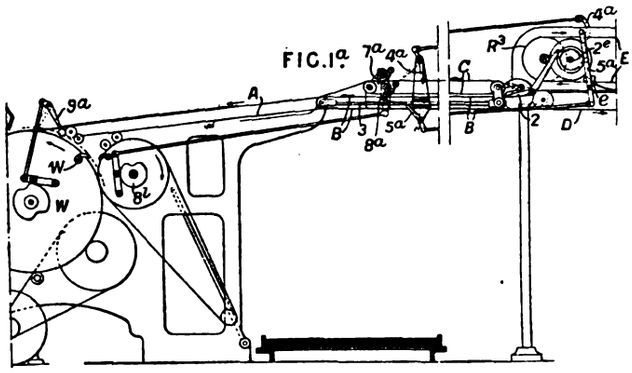
New Inventions

Book Covers.

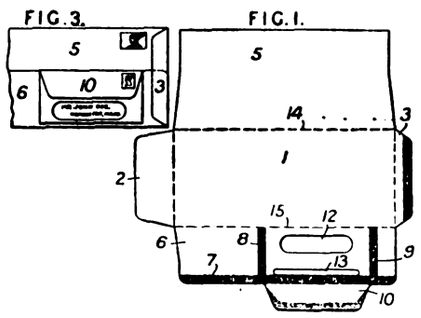
Book covers, in an invention by Mr. J. R. Copeland, comprise a frame of tough homogeneous reinforcing material such as vulcanised fibre recessed to receive the edges of a sheet of thin tough material such as vulcanised fibre or sheet steel. A steel or fibre sheet 1, Fig. 2, is riveted in slots 4, 7 in the inner edges of the fibre frame 3, 6. The fibre strip 6 at the hinge end of the cover is provided with a hinge piece 9 secured in a groove 8. Panels 10 of millboard or other material softer than the frame 3, 6 are secured by rivets to the sheet 1 within the frame, and the outer



face of the outer panel may be depressed below the level of the frame and covered with a facing such as leather. In a modification, Fig. 4, the cover is reinforced by longitudinal spring metal strips 11 accommodated in grooves in the frame 3 and projecting beyond the frame 3 as shown, the metal strips 11, sheet 1 and frame 3 being riveted together. Mr. Copeland has also patented a book cover of the kind having edge reinforcements comprising edge strips of vulcanised fibre secured to the outer face of the cover board and extending continuously around its edges, the recess formed between the strips being filled with a panel to complete the thickness of the cover. Fibre strips 3, Fig 2, are secured by means such as rivets 4 to a board 1 of millboard, and the recess between the strips 3 is filled in with a millboard panel 5 having a

fabric cover 6. Strips 2 of thin sheet material, such as vulcanised fibre, and of greater width than the strips 3, may be secured to the face of the base 1 beneath the strips 3 by the rivets 4. The edges of the fabric 6 may be secured beneath the strips 3 and folded over the edges of the base 1 as shown. In a modification, Fig. 4, the fibre strips 7 are provided with a flange 8 abutting against the outer edges of the base 1 to form a protective edge over the full thickness of the cover.

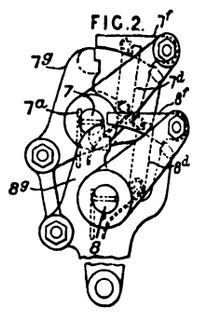
Feeding and Transferring Sheets.



In an invention by the United Printing Machinery Company, sheets are transferred from one machine, e.g., a printing machine, to a second, e.g., a bronzing machine, by a conveyor which is driven faster than the first machine, and are passed to other conveying means whereon the sheet is first retarded, then stopped, and finally released by the action of feeler mechanism which causes the sheet to pass on to a third conveying mechanism driven slightly faster than the second machine, the sheet being again retarded and fed at the correct time. The invention is especially applicable to two machines driven independently, and the second machine is driven slightly faster than the first, so that the sheets from the first machine do not accumulate. The second machine however makes one idle revolution occasionally. The sheets pass from the impression cylinder of the printing machine to grippers e on a chain E, which finally deposits the sheets on a set of tapes D. From the tapes D the sheets pass alternately to a set of tapes C or B, being directed thereto by a cam-operated switch 2. The tapes C, B, are arranged in a pivoted frame 3 situated between the frames of the printing press and of the bronzing machine W. As the sheets are travelling along the tapes C, or B, they are acted on by retarding devices 4a, 5a, which are oscillated between the positions shown by full and dotted lines by cams on a shaft 2e driven from the shaft of a roller R^3 over which the tapes E pass. The sheets are thus retarded as they approach stops 7a, or 8a, which arrest the sheets before they pass on to the final conveying tapes A. The tapes A are driven from the bronzing machine at a slightly greater peripheral speed than this machine, and the tapes B, C, also move at the same speed. Before the sheets are taken by the grippers w of the bronzing machine, they are slowed down by an oscellating arm 9a which finally

allows the sheets to pass to the machine at the correct time. The stops 7a, 8a, which arrest the sheets on the tapes C, B, are actuated to release the sheets by feeler means controlled by the presence of the sheet. After a certain number of revolutions a sheet arrives too late to be released, and the machine W then makes an idle revolution. The stops 7a, 8a, are normally raised by arms 7a, 8a, of oscillating levers which are oscillated in unison by a cam 81 and lever-and-link mechanism. The feelers release latches 7d, or 8d, and cause fingers 7f, 8f, to engage notches on the levers 7a, 8a, and thus arms 7, 8, are rotated to raise the stops 7a, 8a.

Envelope Making.



The United States Envelope Company has patented an invention in this country whereby in an envelope of the kind formed from a single blank into compartments which are provided with independent closures, two compartments of different sizes are provided, the smaller being located upon the exterior of the larger. The flap 5 of the blank, Fig. 1, is folded about the

line 14 on to the body portion 1 to form the larger compartment, the narrower flap 7 then being folded about the line 15 on to the flap 5 and secured to it by the gummed portions 7, 8, 9 which embrace the smaller compar ment. The gummed end flap 3 is folded over and secured to the flaps 5, 6, Fig. 3, to close one end of the larger compartment, the other end being closed as desired by a flap 2. A slot 13 which can be covered by a gummed flap 10 provides access to the smaller compartment, and a window 12 is provided to reveal the address upon an enclosure. In a modification the smaller compartment is made longer by arranging the gummed portions 8, 9 at the ends of the flap 6, and in addition the closing flap 2 is made an extension of the flap 5.

Photo-Mechanical Dye Printing.

An invention by Mr. W. Vobach relates to a process of producing dye-prints on paper or diapositives, of the kind in which a colloid image is coloured with aniline dye and brought into close contact with a gelatine layer, to which the dye migrates, the colloid image is produced in a sensitised colloid layer with which is incorporated finely-divided substances such as

carbon, chalk, sludge, resin, &c., which facilitate absorption of dye by the layer. The colloid layer may be of bichromated gelatine, and exposed from the rear under a negative and developed in warm water without transfer, thus producing a diapositive which may be dyed immediately and used as a printing-plate. The process may be applied to the production of multi-colour prints.

Printer's Rules.

A patent in the name of Mr. J. E. Barber refers to rule integral with interlinear spaces which are made in the form of cast metal blocks type-high and bearing on the surface a number of parallel lines or printing dotted faces, and these blocks are cut up into sectional rules of varying width and length for use with ordinary rules in building up ruled formes. The dotted rules can be used as leaders for time-tables, and preferably have different numbers of dots in alternate rows.

Norwegian Kraft.

Allegations of Dumping in U.S.A.

Evidence relating to allegations of dumping of Norwegian kraft paper in the United States was recently heard at Washington by Mr. McKenzie Moss, assistant secretary of the Treasury.

The suggestion of dumping was combatted by representatives of importing companies, who based their claim that there was no dumping on figures tending to show that Norwegian kraft paper was a minor element in the situation.

The domestic paper manufacturers, however, pointed out that they had submitted definite evidence of the sales of paper at prices which were below the current prices in Norway.

The customs authorities showed that sales of Norwegian kraft were made at 17 per cent. below the current prices in Norway, this being conclusive evidence of dumping, even when based upon the figures of the consular invoices. Later they had made special investigations, and found that the invoice prices were higher than the actual current prices in Norway, thus increasing the spread between the Norway prices and those for which imported kraft was sold.

Testing Blottings.

By J. MELROSE ARNOT.

The *Papier Fabrikant* reprints an interesting and valuable contribution to the above subject, from the Bulletin of the Materials Testing Office at Berlin.

For many years it has been customary to estimate the efficiency of a blotting paper by measuring the height to which it will suck water up in a given time. Many other methods have been tried, used and discarded and this one also was known to be subject to little understood variations which bore no definite

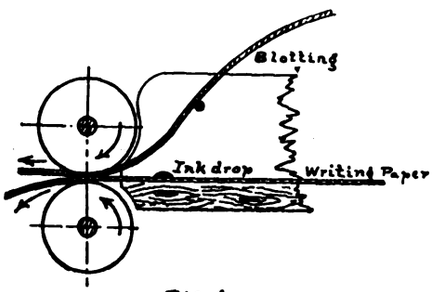

Fig. 1.

relation to the behaviour of the paper when in practical use. It was, however, the most consistent and most easily applied method so far evolved.

In scientific and technical testings, however, any unexplained irregularity cannot be tolerated, so Prof. G. Dalen has been working at the problem and, with the assistance of Herr Nickel, has obtained results which may be shortly stated as follows :—

Naturally it would appear that a true idea of the value of a blotting can be obtained only by tests applied to the surface; Beadle, Stevens and others long ago insisted on this view point. Prof. Dalen proceeded from the

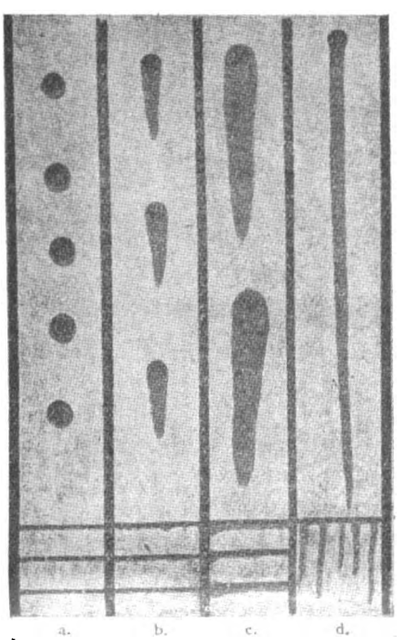

Fig. 2.

observation of various blottings when used on the ordinary semi circular spring blotter so much in vogue on the Continent. He used ruled lines of varying thickness, but it is difficult to get the ink quantity even and equal on all lines of one width, and the blurring effect of poor blottings is irregular and often indistinct. Herr Nickel suggested using ink drops instead of lines, as drops are more easily produced of exactly the same size and ink content.

At first the semi-circular blotter was mounted so that weighted levers gave it a steady turning movement at a definite speed, then a roller covered with the blotting to be tested and actuated by a modified Atwoods machine was tried, and this developed into the construction shown in Fig. 1. The bottom roller is driven and rotates the top one by friction, the paper strips are guided between the rolls by a trough. The rolls are 3.4 cm. in diameter and 3.7 cm. long, the pressure exerted by the top roller is 0.7 kg. The speed of rotation was so selected that, even with the worst papers, the ink spread should not measure more than 30 cm. and was fixed at 10 cm. per second.

In making the tests, the blotting and a writing paper in strips 3 cm. wide and about 30 cm. long were used. From a height of 2 cm. an ink drop was caused to fall from a burette on to the writing paper, which was immediately laid in the trough and drawn through the rolls along with the blotting under test, which was fed in at the top at a definite angle.

According to the absorbency and the facility with which the surface of the blotting can be wetted the ink drop will be rolled out to a more or less long spread, tailing off to a point as shown in the photo reproduction (Fig. 2), which shows, half size, the blotting spreads or figures made by drops and lines on four different papers—(*a*) a good easily wetted paper, (*b*) and (*c*) medium, (*d*) poor. The spread (*c*) is broader than the others, and this broad figure is characteristic of all very thin blottings, and is retained even when several strips are placed over one another and tested together. Accordingly one should take the breadth, as well as the length of the spread into consideration, but for simplicity the length only has been used at present.

The spread figures are at first identical on both the blotting and the writing, but on lying the figure on the blotting spreads still a little further, and for this reason it is better to use the writing paper for the measurements. The measurement is made from the lower edge of the drop to the end of the sharp point of the spread.

Provided that the ink contains no precipitate and that it is quite liquid, it matters little what kind of ink is used, and any reasonably hard-sized writing will serve for the bottom strip. The tests done were made at an air moisture of 35 per cent. to 45 per cent.; but as air moisture has a small effect on the results, all future tests will be made at 65 per cent. air moisture.

The values found refer only to the conditions under which they were obtained. They alter with the pressure of the rollers, with the angle made by the two strips as they enter the rollers, and above all with the speed. By increasing the pressure to three times its original value, the length of the spread was increased 10 per cent. and an increase of speed from 10 to 11 cm. per second increased the length of spread by 4 per cent. When the proportions of the apparatus have been finally fixed, testing will present no difficulty.

Tests were made on 38 blottings, ranging through all qualities, and tables of results are given. These contain also the figures for the capillary test and for Beadle's zone test, as well as the values estimated by practical use of the blotting papers.

The reason for the disagreement between the capillarity and the wetting characteristic is to be sought principally in the presence of fats or rosins in or on the paper, and the proofs are given; a slightly greasy drying cylinder may be a quite sufficient cause. This work shows that not only must materials free from fats and rosins be used in making blottings, but care must also be taken that the paper has no opportunity for taking up such substances on its surface.

FEWER UNEMPLOYED.—The number of persons on July 9th recorded on the live registers of the employment exchanges in Great Britain as wholly unemployed was 1,189,100. This was 2,250 less than in the preceding week and 296,778 less than the figure recorded on January 1st, 1923. The number working short time and drawing benefit for intervals of unemployment was 63,200 on July 9th, as compared with 63,150 on July 2, and 56,261 on January 1st, 1923.

Jubilee Exhibition, Gothenburg.

British Paper Traders' Visit.

Happy memories will long linger with the representatives of the British paper and wood pulp industries who visited Gothenburg at the invitation of the Swedish Cellulose and Wood Pulp Associations. Quite a large party joined the s.s. "Saga," of about 3,000 tons, one of the fleet of the Swedish-Lloyd line which maintains an excellent service between Gothenburg and London and Gothenburg and Newcastle. The vessel left Tilbury about mid-day on Saturday, the 7th inst., and the trip was made under the most ideal conditions.

GENERAL VIEW OF THE EXHIBITION.

The Exhibition.

Naturally the Gothenburg Tercentenary Jubilee Exhibition was a strong attraction, a unique opportunity being afforded to study contemporary Swedish life in nearly all its phases. It was officially arranged for the visitors to make a round of the exhibition on the Tuesday, and a large number placed themselves under the guidance of Mr. T. Karling, publicity manager, and Mr. Edward Miltopæus, manager of the export department of the Exhibition. It may be mentioned that the party received a special invitation, which constituted a season ticket, from the Council of the Exhibition, thus allowing them to make a close study of the various exhibits at any time.

Papermakers of the younger generation from Lancashire, North Wales and Scotland were particularly keen in their inspection of the different sections, indicating a desire to be thoroughly acquainted with the progress and developments of countries outside the United Kingdom. Much could be written of the numerous attractions, but of outstanding interest to the visitors were the Great Machinery Hall and the exhibit of pulp, paper and stationery.

Pulp and Paper.

This is a collective exhibit of the members of the Swedish Cellulose and Wood Pulp Associations and the Swedish Paper Mills Association. An excellent idea is afforded of the processes for treating wood in the manufacture of different classes of pulp. The walls of the building contain many samples of pulp, the brands of which are well known to the British papermaker, and also a wide variety of papers, from news-print to the finer qualities. Coloured sketches furnished an excellent idea of the forest lands, logs and various processes leading up to the finished article. Grinders, digesters, strainers, hydraulic presses, glazing machines and so forth are to be seen. The ladies were particularly charmed with the "silk" hanks of gorgeous hues made from wood fibre. There is also an instructive collection of by-products from the pulp effluents.

An attractive exhibit is the fine model papermaking machine supplied by the A/B Karlstads Mekaniska Verkstad, of Karlstad. Although not working, it is fully equipped in every detail. It is a splendid model. The other exhibits of this firm include long log barking machines, the Spangenberg type of knot screen, and the "Record" log frame, etc.

Felt firms are well represented, also rubber firms.

A fund of information is afforded by the large-scale tables that adorn the walls, statistics being presented showing the marvellous growth of the export trade of Swedish pulp and paper.

In another part of the Exhibition is shown the process of hand-made paper manufacture.

The Banquet.

The great event of Thursday was the banquet, which took place at the Exhibition Head Restaurant in the evening.

An extra summer meeting of the Swedish associations was arranged, members of the British Papermakers' Association and the British Wood Pulp Association being officially invited. We understand that the principal subjects, upon which there was practical agreement subject to certain details, were the Contract Note and Charter Party.

Needless to say, the proceedings throughout were of the most exhilarating character. Representatives from all over the country attended, and their desire was to give their guests a good time. Although the social side was in the ascendency, the gathering gave the opportunity to business friends of meeting together, renewing former relationships, and cementing friendships of many years standing. "Skäll," uttered with sincerity, frequently punctuated the proceedings, and the British were no less in earnest in voicing "They are jolly good fellows."

A Visit to Marstrand.

The hospitality of the Swedish Associations was extended to the visitors on the following day (Friday), when arrangements were made for a visit to Marstrand.

THE NATIONAL Association of Wholesale Stationers AND PAPER MERCHANTS.

National Council Meeting.

The thirty-ninth meeting of the National Council was held at the Council Chamber on Thursday, July 12th, Mr. A. Dykes Spicer, the president, being in the chair.

The Council unanimously recorded their deep regret at the recent deaths of Mr. Arthur W. Dean and of Mr. Joseph Dewick, both of whom had been very closely connected with the Association for many years.

A full report was made on the Joint Conference which had been held recently with the Federation of Master Printers, a lengthy discussion taking place on the several points to be discussed at the next meeting of the Joint Committee to be held at an early date.

The views of the Council were obtained on the question of the collection by the English Revenue authorities of income-tax on the profits made by foreign firms in respect of their raw or partly-manufactured goods sold in this country through English agents and brokers.

Correspondence which had taken place between this Association and allied organisations on various matters was dealt with at length by the meeting.

The present position with regard to the Norwegian and Swedish General Trade Rules was reported, various subjects arising thereout receiving the full consideration of the Council.

The next meeting of the National Council will be held on Thursday, October 11th, 1923.

THE TRIUMPH OF Modern Offset Lithography

By JOSEPH GOODMAN, F.R.P.S.,

City and Guilds of London Honours Silver and Bronze Medallist, Lithography and Photo-Mechanical Processes. Author of "Practical Modern Metalithography," etc.

Offset lithography to-day is steaming ahead along the channels of commercial and mercantile printing production and trading service, rather than upon the narrow but more picturesque rivers of purely pictorial and speculative art. The compass points to the harbours of utility and merchandise as the safest ports, with occasional sailings of pleasure to the havens of fine art. This trend is not actuated by any shortcomings inherent in the offset process, but because modern business methods want the best aids that can be enlisted in their service, and likewise the economic conditions of our times demand immediate returns for capital expenditure and outlay, in contrast to the fickle and slow patronage that attends pure art ventures of to-day.

One can look back to the periods of the old direct lithography days when the whole art world turned to the stone as the best medium for translating their genius and expression to the "world and his wife." At the present time art must be sandwiched in between utility and commercial aspirations and expectations; otherwise it is of uneconomic and restrictedly philanthropic value.

Masters at the Stone.

It was in the former capacity that the world's great masters of art delineation in all spheres of expression and capacity selected lithography as the best medium for perpetuating their talent. Thus the renowned T. Sydney Cooper drew many of his famous animal studies and pastoral scenes upon the lithographic stone; largely chalk work upon a grained stone, both with and without a tint accompaniment.

Sam Prout's beautiful architectural and landmark plates were in like manner produced upon litho stone, in both "line" and "crayon" and also upon the earliest form of transfer paper by this talented English artist. Likewise Bonnington's beautiful drawings of "Picturesque Europe," which perpetuate mediæval elegance for future generations to admire. And so on through Joseph Nash's exhibition drawings and sporting plates portraying both the vices and virtues of our race for posterity to contemplate. Nor can one omit that versatile artist printer, Hullmandel, and his compatriot Ackermann, both of whom rendered colossal service to the art during a period when it had much to conquer in both method and prestige, and yet have left behind them monumental works of merit and charm.

Makers of Standards.

Following on with other times and other men, we must not omit reference to Thackeray, Wm. Strang, Whistler, William Morris and Walter Crane, who utilised lithography for all it was worth in the realm of design both for textile, illustration, and mural decorative work that have become standards of excellence and models of study for art students and manufacturers in all lands and walks of life, and for all time.

Abroad, Piloty, Strixner, Delacroix and a host of others embraced lithography with enthusiasm and labour of love, leaving behind them immortal works such as the illustrations to "Faust," the reproductions of Rembrandt, and the glowing pictorial legends such as the "Sleeping Sentinel," etc., which have created an immortal halo of fame and character around the life of the great Napoleon.

Of the moderns we need only refer to the Biggerstaffe Bros., Phil Ray, Joseph Pennell, R. Way, Bone, etc.

It was thus in this unassailable period that the litho stone yielded up

"Triumph after Triumph"

and conquest after conquest; Monarchs patronised it, Academies honoured it. When Prince Louis of Bavaria visited Senefelder's workroom, he wrote with lithographic ink upon lithographic transfer paper the following sentence: "Lithography is the most important discovery of the 18th century." This diction was at once transferred to stone and copies immediately printed off for the royal visitor.

All this was direct lithography, the method in which the inked image upon the cumbrous litho stone yielded direct from its surface the black impression upon the paper without any intermediary transfer agency whatever. The metal zinc was also used to a very limited extent, but in very thick slabs, virtually as heavy and as cumbrous as the litho stone itself, and with planished surface instead of granular.

A Persistent, Progressive Craft.

Despite the alarmist prediction with which from time to time the lithographic industry has been assailed, it is in reality the most progressive craft in printerdom; it is moreover endowed with two very powerful allies, photography and engineering, both of which are incessantly dowering it with more prolific and potent powers, peculiarly adaptable to itself alone. Accelerated speed, improved facilities, economic methods and more perfect attainments are its daily heritage.

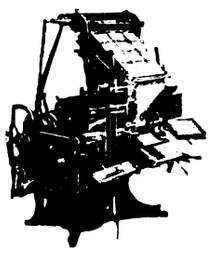
The most potent of the modern developments of lithography is the "offset" or the "rubber transfer printing" method, a procedure which gives the most perfect and sensitive impression, with the greatest delicacy and brilliance, and upon any class of paper or flexible material, of any of the present day modes of printing. Already it is catering for very nearly every industry and manufacture. Trade after trade is utilising it, so that it is fast entering into the life utility of every citizen of civilisation. We have only to make a rough daily record of our association with lithography in our ordinary, normal pursuits of life to convince us of its ubiquity and utility.

Widespread Use of Lithography.

It greets us on arising in the morning in our bedchamber from the framed chromos decorating the walls, and from the printed texts so often associated with Christian devotions. Even the decorated toilet and trinket ware bears tribute to the craft of the lithographer, from the ceramic transfers with which it is embellished, and ornamented. And so on with the more modest and simple pomade pots of our ablution requirements.

Lithography accompanies us to the breakfast table, where our first toothsome dish of porridge is selected through the agency of the brilliantly printed carton of oats; or the inviting jam and marmalade label helps to decide our partiality for one or other of these delicacies. If our taste leans to the succulent

Digitized by Google



Display Composition Costs.

NO PRINTER CAN TO-DAY AFFORD TO SET HIS DISPLAY BY HAND.

All type composition from 5-point to 36-point is essentially work for mechanical composition, and the most profitable machine for such work is the Linotype. (This machine sets type faces up to 60-point, but beyond 36-point the faces are of a more or less condensed character.)

The Linotype slug—recognised throughout the world as the best unit for type composition—has many additional advantages in the jobbing department.

Let us tell you about them.

sardine, there again the tin container is decorated with the offset tin printer's craftmanship. In respect even of our liquid sustenance, whether our choice lies with tea, coffee or cocoa, each of these will have come from a receptacle lithographically decorated and partaken of from cups and saucers rendered attractive by ceramic lithography, whether of the blue Chinese love legend design, or that of some pleasant floral pattern.

On pursuing our journey to business either by bus, tram, or train, our offset craft accompanies us on the way in one form or another. It will assert itself as a chromo litho transparency upon the windows of the bus or tram, advertising some trader's business most effectively, or it may be a chromo litho showcard affixed to the overhead panels of the train compartment, or an enamelled metal plate attached to the interior of the railway carriage doors, and further the simple inscription of the word "Smoking" upon the windows of compartments set aside for the accommodation of devotees of the fragrant weed is nothing more nor less than a lithographic transparency; and so the products of our craft never leave us.

The Unescapable Art.

Arrived at business we do not for a moment escape its attention, as facing us at the desk the lithographic coloured calendar reminds us ever of the days that come and the days that go, and the days that are still to come; even the simple office stationery, from business card to invoice and statement again assure us of the indispensable service which our versatile art craft renders us at every turn.

If we become "liverish" or out of sorts, or want to cultivate that "Kruschen" feeling, the lithographic coloured poster on every hoarding, or the appealing showcard in the chemist's store windows, directs us gratuitously to the best and most infallible remedy for our ills.

Even our morning's correspondence is unconsciously looked forward to for the emblem of lithography which it may contain in the form of a fat lithographic cheque or dividend warrant, or other acceptable scroll of financial fame.

Our midday meal table continues the story with its appealing and appetising bottles of gaily labelled sauce, pickles or wine, and its lithographically decorated dinner service. It is almost a certainty that our attention will be arrested by some mural decoration of framed picture invariably the work of the lithographer; whilst we select the dishes that please us most from a lithographic menu card tastefully and appropriately coloured for its purpose. Even the after-dinner cigar is selected from a lithographically decorated box, and the roll of tobacco leaf itself is encased in a litho cigar ring of many colours, like Joseph's coat of old.

At the end of our day's toil we select our rendezvous of pleasure or recreation through the attractive invitations offered us by the theatrical or cinema coloured poster advertisements prepared by the tireless toil of the lithographer.

MESSRS. JORDAN AND SONS, LIMITED, company registration agents, Chancery-lane, London, W.C.2, have issued a summary of the company registrations at Somerset House during January 1st to June 30th, 1923. The increase in the number of new registrations recorded in 1922, over those in 1921, has been fully maintained during the half year under review. Two public Stationers' companies were registered with a combined capital of £374,700, whilst 91 private companies were registered with a combined capital of £753,320. The total registrations in regard to the stationery trade were thus 93 and the total capital involved £1,128,020.

Advantages of Offset Printing.

An American Appraisal.

One of the points to be noted by the printer who wishes to make the most of the offset process is that this process, like any other, has certain outstanding advantages and is particularly adapted to certain classes of work No printing method, however, can claim to be the best for use in every case, and it is therefore important to learn what classes of work are being successfully done by offset, and what requirements the process is particularly adapted to meet.

Mr. Robert F. Salade, writing in the *American Printer* indicates directions in which offset is being applied in the States. One prominent printing concern, he states, is now operating a battery of large-sized rotary offset presses on such work as lithographed sheets for cheque books, letterheads, noteheads, calendar backs, display signs, and sheets for envelopes. Much of this variety of work, which had formerly been done on stone lithographic presses, is printed in two colours, and the sheets are as large as 45 by 65 inches. This company is making a specialty of offset product for banks, trust companies, insurance companies, etc., the principal lines being business stationery and cheque books.

As a contrast to this case, a large paper box manufacturing concern is running a number of both one-colour and two-colour offset presses on big orders for folding boxes, cartons and display containers. Among other work this company produces several millions of cigarette boxes every day, the stock for the boxes being lithographed in two or three colours. The stock for the folding boxes, cartons and display containers is lithographed in from two to four colours. A recent order was for 50,000,000 medium-size folding boxes, this job being lithographed in four colours by the offset process. As many as 250 complete designs for small-size folding boxes are sometimes lithographed in colours on a single sheet of stock. The two-colour presses print two colours at one operation.

In other cases the offset presses are being employed for the printing of street car cards, advertising specialties, pictorial calendars, greeting cards, paper box wrappers, illustrated catalogues and advertising literature. It is almost safe to say that any kind of a printing job can now be handled on a modern offset press, although reproductions of forms of type, copper half-tones or electrotypes are not to be strongly recommended, as such reproductions are not as sharp as they should be.

Proceeding to indicate the particular advantages of offset, the same writer points out that, because of the great resiliency of the rubber blanket on an offset press, it is possible to print rough stock on an offset press with the same ease as printing on smooth stock, and it matters not whether the plates contain half-tone etchings or solid detail. Thin, cheap stock can be lithographed to practically the same advantage as a smooth, expensive paper; in truth, offset work on rough stock presents a more artistic appearance than the same work done on coated paper. Bond paper, "news," book paper, kraft, linen ledger, thin box-board and plated paper are all the same to an offset press, and it will even put on to blotter stock a coloured picture without difficulty. On some makes of offset presses, box-board up to 40 points in thickness can be lithographed with no trouble at all.

And, as for make-ready, there is actually no make-ready as the work is known to the typographic pressman. After the large size zinc plate has been properly etched and treated, all that is necessary is to set the wet rollers and the inking rollers. The soft rubber blanket automatically furnishes the make-ready, and the sheets are rapidly printed to perfect register. Perfect detail in the printing depends, of course, upon perfect transfers on the metal plates. Even a greasy finger-mark made carelessly on the metal plate is apt to take ink and print, which means that the metal plates must be treated and etched with the greatest care.

In the offset process there is a considerable saving of ink over stone lithography or typographic printing. Solid colours and tints are printed with the same ease as delicately engraved designs. Four-colour process jobs are as easy as single-colour printing; that is, after the process colour plates have been properly made and registered.

"RECORD TYPE"

THIS Type is cast from Specially Mixed Virgin Metal, is exceptionally hard, and guaranteed True.

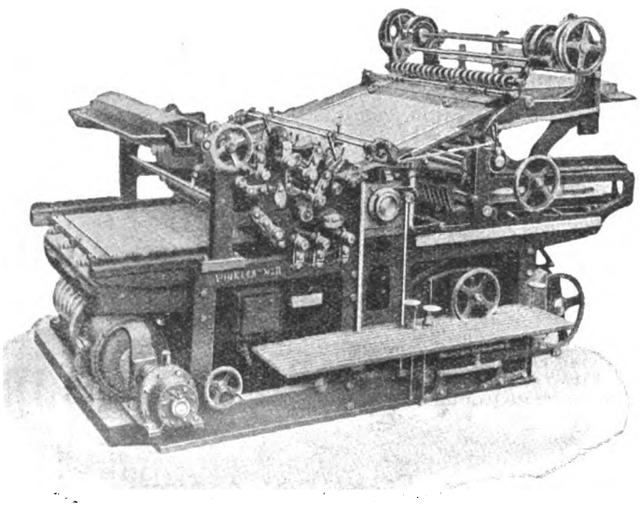
An Automatic "Craftsman"



would do that platen job of yours better and faster than any other machine.

Obtain particulars from—

THE LANSTON MONOTYPE CORPORATION LIMITED,
PRINTERS' MACHINERY DEPARTMENT,
43/44, Fetter Lane, London, E.C. 4.

The "WINKLER" High Speed Automatic Art Press.

With Oscillating Cylinder and Printed Side-Up Delivery Without Sticks.

Discriminating printers recognise it to be the ideal machine for producing Fine Half-Tone and Multi-Colour Work.

Unequalled for Dead Register, Rolling Power, Impressional Strength, Speed and Noiseless Running.

Occupies only about half the floor space of a two-revolution machine for the same size of sheet.

The middle inking roller is of smaller diameter, thus eliminating any possibility of circumference marks on solid surfaces.

The forme is supplied with **fresh** ink from **all** inking rollers both during the forward and backward space movement of the bed.

To prevent "picking" when printing difficult work on art paper **electric heating** of the bed is provided, the inking rollers being specially **water-cooled.**

Automatic Cylinder Check, Throw-off of inking rollers and Slow Motion.

SWISS MANUFACTURE.

INSPECTION INVITED.

The Lithographic Trade.

Notes and News.

THERE is a strong note of optimism in the lithographic section of the trade, where good conditions continue to prevail. In many directions business is spoken of as being quite brisk. So far as unemployment is concerned the members of the Amalgamated Society of Lithographic Printers signing the out-of-work books show a consistent tendency to decline. The numbers now signing amount to only about half what they were last year.

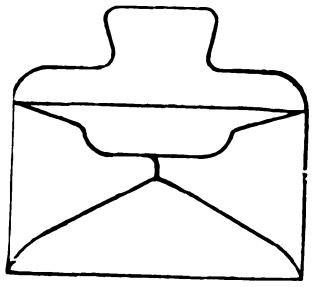
NEGOTIATIONS now being conducted with a view to bringing about amalgamation between the Amalgamated Society of Lithographic Printers and the Amalgamated Society of Lithographic Artists were carried a stage further on Wednesday of last week, when a meeting was held of the executive committees of both societies. The two committees, after some discussion, approved of the appointment of a sub-committee to deal with the question.

THE Conciliation Committee of the Joint Industrial Council met on Wednesday of last week at Bristol in respect of a dispute in the Amalgamated Society of Lithographic Printers affecting the employment of 17 non-members of the union. As a result of that conference the employees concerned were met on Friday by the joint secretaries of the J.I.C., Messrs. A. E. Goodwin and A. E. Holmes. After discussion of the matter the men requested Mr. Holmes to ask the secretary of the Amalgamated Society to meet them and consider the whole position, and Mr. Holmes agreed to do so.

THE advice is reiterated by a writer in the *Inland Printer* that offset printers should arrange with a neighbouring photo-engraver to photo-print their printing jobs on the grained metal, either aluminum or zinc, and thus "save the expense and annoyance of a camera and the rest of the photo-planographic outfit." Many offset printers in several cities, it is stated, have established a profitable arrangement with photo-engravers. The latter have not been obliged to increase their outfits except in the matter of a turntable or whirler on which to fasten the thin metal when coating with the sensitising solution and whirling dry. One firm in New York and another in Philadelphia do photo-planographic business on a large scale for distant points. The plates after development are coated with gum solution, which dries and makes a protective varnish that is washed away before printing from the plate.

AMONGST fresh matter added to the new edition of that very handy little book, "The Estimator" (Ebor Press, York, 10s. 6d., post free), the most important is a series of selling tables for litho label work and letter headings (flat-bed and offset). An approximate middle cost scale is given for stone polishing and plate preparing, in sizes from crown to 60 by 40. A table is included indicating transferring costs for general work in sizes from demy 4to. to quad demy with number of transfers on sheet ranging from 1 to 100. A scale shows litho machining costs (including mixing colours and wash-up) covering both flat-bed work and rotary offset in a number of sizes. A selling scale for lithographed labels, flat-bed printed, provides a useful guide to prices per thousand in various sizes and quantities and on different papers. Prices of lithographed letter heads are also listed, and selling prices tabulated for the varnishing of lithographed labels.

THE newly-elected president of the National Association of Employing Lithographers (U.S.A.) is Mr. Joseph Deutsch, of the Edwards and Deutsch Lithographic Co., Chicago and Milwaukee.



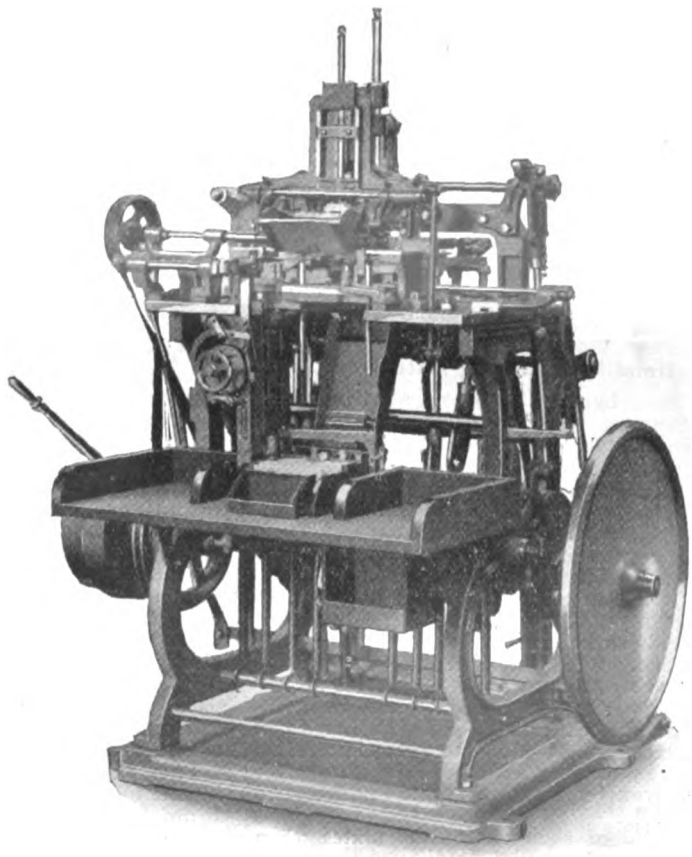
WE learn that much appreciation has been expressed in respect of the recent offset-printed number of the *Monotype Recorder*, the periodical issued by the Lanston Monotype Corporation Ltd. It called forth further praise for the capabilities of the well-known lithographers, Messrs. Blades, East and Blades, as well as being a reminder of the go-ahead character of the Monotype firm.

THE Society of Printing Ink Makers are, we understand, still proceeding with their efforts to produce an efficient substitute for bronze powders in litho. Gold ink displacing bronze powders in letterpress work is already being widely used, but the problem of a litho gold is a more difficult matter and the outcome of the ink makers' endeavours will be awaited with interest.

ONE of the minor yet vitally important details of offset printing is the question of inks, as the choice of an ink which is thoroughly reliable both for excellence and for uniformity of quality makes all the difference between success or failure in producing uniformly high-class work and doing so without unnecessary expenditure of labour. Amongst those who are giving special attention to the supplying of lithographers' needs in this direction note should be made of the house of R. A. Bartlett, Ltd. We learn that special inks from this source are being used by some of the principal offset printers both in London and the provinces, and that economy of working and superior results have brought the makers some very gratifying expressions of satisfaction from users.

A WELL-PRINTED folder received from Messrs. B. Winstone and Sons, Ltd., reminds us of the many items which this old-established house supplies to the requirements of the lithographic printer. Litho artists' inks, zinc plates (grained or polished), a wide range of transfer papers, blanket, felt, flannel —these are only a few of the lines in which this supply house holds good stocks of the requisite qualities. A full "Sundries Price List, 1923," is obtainable on request.

THE *Placard and Service Billposter*, the house organ of Messrs. Sheldons, Ltd., of Leeds, is interesting not only on account of its articles relating to posters and allied subjects but also because of the many reproductions of posters it contains. The magazine is well printed by Messrs. Chorley and Pickersgill, Ltd.



Are you planning for the new Postal Regulations ?

After December the Post Office will not accept envelopes with tucked in flaps when they exceed 4½ in. in width. This will mean a larger demand for commercial and pocket shapes with tongue flaps.

We can supply you with "LEADER" envelope machines without drying chain, which will produce these shapes at a high speed, the output being more than

50,000 per day.

Photo-Litho Printing Surface Production.

By FREDERIC T. CORKETT, F.R.P.S.

(Managing Director of Pictorial Machinery Limited.)

Let me say at first that, given a correctly made photographic negative, a suitable printing frame (which, however, must be a craftsman's appliance, not simply a loosely strung together and badly constructed experimental hoop-iron arrangement), correct and sufficiently powerful electric lamps, and, above all things, a correctly sensitised and adequately exposed metal surface (and this may be of zinc or aluminium) there is nothing at all difficult in producing a perfectly satisfactory, crisp and clean printing surface every time, a surface, too, of extreme long-life and that responds to all the familiar treatments of the lithographer. And the strange thing about this great yet simple procedure is that really there is nothing very new about much of the procedure from first to last.

Just think of the fact that it is 41 years ago since a piece of zinc was first sensitised (1872), and a photo litho plate made therefrom. And yet, on and off in all these 41 years, lithographers have worked from stone, for certain obvious advantages partly, but really because other methods were not apparent to them, and all these years these older workers have been ignoring, abusing, nay almost vilifying (if you like) work produced in other ways than that they knew of, namely, their dear German stone.

The Metal Age Dawns.

But a change comes o'er the scene. The rotary lithographic printing surface unfolds its possibilities; metal plates bearing an image photographically produced are more evidently possible—these metal printing plates placed around a cylinder, too. Hey, Presto! What have we now, and this combined with offset? Speed in printing, a new charm in print production, and combined with the greatest simplicity of manufacture of the printing surface itself. How many printers know how easy this plate production really is? Metal has superseded the Stone Age once again, just as it did in the history of this old world.

The process camera with its unerring eye, the process lens, faithfully copies the original—be it a map, a design, a piece of music, letterpress or what not—almost at a glance, for photographic exposures with the correct and fast electric arcs or mercury vapour installations are now made in a very few seconds. The negatives are very quickly made, either on wet or dry plates, dried up (and here the electric drying cupboard comes in) spotted, blocked out and ready for the printing frame. If need be, all this can be done—say, of a black-and-white design or a piece of letterpress—in 30 minutes, at any rate easily under one hour at the most, dependent always, of course, on the size of the actual negative and work involved. And then, in 30 minutes more, you can sensitise your metal, make the exposure of your negative on to the metal, roll up and wash out—all in one hour and 30 minutes, say, from the time copy was first handed you; and even this time could be materially cut down, as it will have to be when photo-offset plays a larger part, as, in my opinion, it will do, in newspaper production of the future.

Hand Transferring Outclassed.

A 31in. by 22in. multi-negative made in the Lithotex Step-and-Repeat Machine can be printed four times down within the hour, and consequently produces a 65in. by 45in. metal photo-litho printing surface all ready for the machine within an hour. As such a multi-negative may have as many as 100 repetitions of a design upon it, and as being printed down four times provides in all 400 repetitions, or 400-up as the printer says, it will be readily clear that no hand transferrer can compete with such repetition. A Lithotex stepped-up negative of a very well-known label was made five years ago, and, as the job comes in at intervals and involves 200,000 runs or so, a new plate 65in. by 45in. can always be relied on to be made in one hour. No transferrer could transfer such a plate under two days! ! !

The life of such photo-litho plates when correctly made—and I emphasise this point most advisedly—is astounding. A quarter of a million runs can be relied on; in fact, the plates properly treated stand up to all sorts of treatment, but the printing of such plates must be well understood and the machinery itself of the requisite qualification. The printing of such surfaces is not my business—one must stop somewhere—and it is here that the lithographic craftsman must bring all his skill to bear; but let it be said no technical difficulties need be anticipated. All sorts of opposition from printers, however, has in the past been met with. All sorts of dopes used to prevent the satisfactory plate being demonstrated, and I am told this on the authority of some of our greatest printers, both at home and abroad. It all comes down to this, that the lithographic pressman who cannot print a photo-litho zinc or aluminium plate does not know his job, is not intelligent enough to be a litho pressman, and his employer had better tell him to seek a job elsewhere.

Supposed Difficulties in Practice.

It is a fact, however, that the photo-litho operator, that is, the camera man, the negative producer and maker of photo-litho printing plates, is in advance of the litho pressman. Many of these latter men "can't see the wood for the trees," and think only of stones and of stone manipulation. The master printer who finds an old craftsman of this type is in a quandary. Sentiment, of course, must come in, but progress always goes forward ruthlessly, and we cannot live on sentiment, much as one might prefer to do so. One of the largest lithographic printing establishments in Great Britain to-day, has never, so they say, been able to get a satisfactory run from a photo-litho surface! Why, is beyond me. I can only come to one conclusion, and that very reluctantly.

Dopes, mystic solutions, etc., etc., may play some part so far as I know in the actual printing of a lithographic surface, but certainly beyond adjustments of the sensitiser to the lighting and other more or less well-known and tried out formulæ, there are no secret dopes or miraculous liquids (or solids either) in photo-litho plate making. But here do not mistake me. Certainly there are refinements in negative making and plate making also, known to the few, the result of years of practice, little dodges, if you like, that experience has taught are advisable either to secure a given effect, a longer life to the plate or to aid the production of a plate in which a certain type of screen or granulation is required.

So much depends upon understanding what exactly to do to produce just the effect wanted, and this simply means experience which can only be gained by personal practice or from older workers who know by their own experience and who alone are able to impart information which may be time-saving and valuable. Too much value must not be put on this sort of thing, often much enlarged upon by someone who has either something to sell or who wants a job.

Photo-Litho an Open Path.

Photo-litho, generally speaking, is an open easy path for those who can see what it means. The energetic intelligent craftsman can be relied on to see the way, as also the go-ahead master man, but there will always be those who cannot, and so there will continue to be more room for the man who ventures. It was always this way, and always will be, and perhaps one ought not to grumble at that. The printer adventurer, however, is not dead in Britain. I know many printers who are forging ahead, deserving full well all their progress, and are producing wonderful work; others, great names too, are slowly receding, mainly due to their failing to keep pace with the times, or, most probably, having no one in their establishment capable or even desirous of leading the way.

This article is a general one. I do not intend to give formulæ for sensitising, etc. I am not going to say that the plant of the concern I control is the only practical plant, for, of course, I cannot say that, and the editor would not allow me to do so, but let me say it is important to have correct appliances, to use them properly and to adjust your method very often to your job. Consequently, when installing plant for photo-litho, it is most advisable, indeed necessary, to do this under competent advice. I say this, recognising the full importance of technical direction and practice, and knowing a good deal of certain unsatisfactory installations that have been made and the consequent disappointment and loss of time and money involved.

Printing is a very varied craft, and in photo-litho a very good all-round man may know a very great deal, but only in the union of craft practice by varied workers can a safeguard be found against the possibility of failure of the individual. Photo-litho plate production, it is true, is a real game of chess, with many openings and many agreeable surprises, but it must equally be borne in mind, simple as photo-litho plate production in itself undoubtedly is, that, like chess also, the master printer may have some disagreeable surprises; and unprepared endings and disappointment may result.

Printers' Misconceptions.

It is rather strange at times to receive reports from master printers, who have visited the Continent or the States or elsewhere, to see the latest things in printerdom These reports show that many master printers have a somewhat limited knowledge of photography and the graphic arts; also, I sometimes think that our British folk are greater "believers," shall I say, than other nationalities. For instance, a gentleman just returned from the States tells me they have discovered over there a means of making lithographic plates without photographic cameras at all. He, therefore, says with a confident air that he considers, now having seen this done, he needs no camera, lens and so on. He saw an exhibition where a plate maker took a piece of music, or a piece of letterpress printed on one side of the paper, and printed from this original itself down directly on to the metal and then by a reversal process obtained a lithographic printing surface. Of course, this is well known, and is being done all the time by a number of lithographic houses here, but he came away firmly convinced that he would now want no camera nor lens, and that all the messy operations of photography were now superseded!

Then again, another would-be installer has a strong conviction about photo-litho book work. He has seen the Manul or similar process, by which a negative is made direct from the original by exposure, the black portions of the original in contact with the paper or gelatine or sensitised surface reflecting no light, so that it is possible to produce a negative in this way direct from copy. Here again, while the Manul procedure may be new and subject for patent, anyone can take a piece of bromide paper and make quite a good negative that way, and this has been done times out of number. This is very well, however, where a reproduction of type matter or music, etc., is required same size. Of course, when reduction or enlargement comes in, this process is of no value, and the production of a photographic negative in the camera can by no means be always dispensed with.

All these different procedures and their applications in practical work help instead of hindering the photo-litho photographic operator. They are useful accessories to the camera man, practices that, when used with discretion, all lead to better work being produced and at a cost less than hitherto possible.

The Monotype Users' Association.

We have received a copy of the Rules (1923-4) of the West of England and South Wales Monotype Users' Association, together with a brief report of the annual meeting of the Association, held at Bristol on July 10th. The list of officers elected is as follows: President, J. Corrigan (Bristol); vice-presidents, C. E. Brendon (Plymouth), R. J. Webber (Cardiff), S. A. Penney (Southampton); committee, R. S. Johns (Newport, Mon.), R. C. Conyers (Bristol), J. A. Arrowsmith Brown (Bristol), H. Harmer (Gloucester), C. C. Botwright (Bath), E. Davies (Swansea). The hon. secretary and treasurer is Mr. Howard Rankin, Trenchard-street, Bristol.

Sheet Feeder Economy.

Claims of the "Winkler."

The question of the feeding of sheets to printing machines is one of those minor matters which are nevertheless of the utmost importance in connection with economy of running. Indeed, on a given job, the substitution of automatic for hand feeding may well mean all the difference between a loss and a profit. Automatic feeders are used much more extensively in other industrial countries than in England, and this is one of the reasons why, in a great many cases, foreign printers are able to produce the same quantity and quality of work at lower cost than British firms. It would be untrue to say that this fact is altogether due to lack of judiciousness or enterprise of the British printer, for it cannot be denied that he was for a long time unsuccessfully on the look-out for a good automatic feeder suitable for both long and short runs. With the introduction of automatic feeders upon the British market, however, this excuse for lack of progress no longer holds good, and it is up to every enterprising firm to consider carefully the economics of modern methods of sheet feeding.

In particulars sent us by Messrs. W. J. Light and Co., Ltd., of 36-38, Whitefriars-street, London, E.C.4, emphasis is laid on the following five claims which Messrs. Light make on behalf of the "Winkler" feeder, for which they are the sole agents. This feeder, they state: (1) Permits rapid change from one job to another, and is therefore suitable for short runs; (2) feeds to register any stock from tissue to board; (3) does not increase the length or affect the accessibility of the printing machine; (4) is being supplied at a price within the financial reach of practically every printer; and (5) increases the productive capacity of the printing machine by 25 to 50 per cent. as compared with hand feeding, when feeding large sheets of very thin paper the percentage being even higher.

In this connection it should be remembered that it is more profitable to a printing business to work with a restricted number of fast-running automatically fed printing machines than to run a larger number of hand-fed presses. Messrs. Light point out that every Winkler feeder installed saves the wages of one girl feeder. Less unskilled labour means less overseers and less administrative work to control that labour. Considering that about 33 per cent. of the productive cost of print consists of wages, it follows that a Winkler feeder contributes considerably towards a reduction in the cost of production.

The "Winkler" Sheet Feeder.

Another important consideration in respect of the installation of automatic feeders is the question of "overhead." Overhead costs represent about 33 per cent. of the cost of production of print, and are always in direct proportion to the amount of capital invested in machinery and plant, because the amount of plant installed governs the size of the permanent organisation. If a printer works with 15 hand-fed presses instead of with 10 automatically fed machines, he wants more room, which means more rent, and he requires more labour, which entails more administrative work. He has, in practice, always to maintain an organisation capable of coping with the output of 15 machines, no matter whether he is working full time or short time; and if the plant only runs half time the whole of the overhead costs are carried by one-half of the hours during which the plant is capable of production, instead of by the full number of hours. Overhead expenses will therefore work out at double the usual amount for each hour worked, and wages will be the same. A printer with 10 automatically fed machines will therefore obviously suffer less than his fellow craftsmen when he is working short time, because the overhead costs for 10 machines are correspondingly less than those for 15 presses.

THE latest issue of the *Monotype Recorder* (Lanston Monotype Corporation, Ltd.) contains a number of items of interest to printers, including an article "Tests for Types," by Mr. Francis Meynell. The design and production of this issue have been admirably carried out by Messrs. Silk and Terry, Ltd., Birmingham.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

THURSDAY, AUGUST 2, 1923.

That Post Office Surplus.

THE printing trade's hopes of further concessions in the direction of cheaper postal facilities should not suffer extinction because of the Postmaster-General's recent statement in the House of Commons. The fact that the reduced postage on printed matter has been more than justified—an estimated 20 per cent. increase of business having materialised as 25 per cent.—suggests that still further cheapening of the printed matter rate might pay for itself as well as acting as a tonic to trade. If the increased use of letters and postcards has not been as great as anticipated, this is not necessarily an argument against the reductions granted. What was wanted when the rates were revised, and what is wanted still, is a reversion to the old penny stamp for letters and the halfpenny stamp for post cards. Half measures are often ineffectual where a bold policy abundantly succeeds. The Postmaster-General has now a comfortable surplus of £5,500,000. Let him use it to make further reductions in the prices of his services, and he will not only have linked his name with a popular reform but will also have made a step which must—eventually if not immediately—prove financially justified.

* * *

Foreign Printing Presses Busy on British Work.

WHAT is the reason of so much British work going to foreign countries? The consumer of paper and print no doubt could give a ready answer to the effect that it is solely a question of £ s. d. With complaints on the part of British papermakers and printers of poor orders, which naturally affect full employment, the condition of affairs is, to say the least, serious. A correspondent, who has lately been visiting Germany and Belgium says "it was most interesting to see the enormous amount of English compositions in type running through their printing machines." He goes on to say that printers, papermakers and the allied trades are enjoying a steady business, without fuss, and with a broad smile on their faces owing to trading in sterling. This must mean loss of business to British firms, and extra demands in the way of doles.

* * *

Competition in Chromo Boards.

STILL another example of severe foreign competition is brought to our notice. This time it relates to chromo boards. Samples of German goods of this class have been offered at 3⅛d. per lb. for white boards coated one side and 3¾d. per lb. coated both sides. For chrome yellow or other light tints the quotations have been respectively 3½d. and 4d., and for intense colours 3¾d. and 4½d. These prices are quoted net f.o.b. Hamburg, plus 3 per cent. for packing. When it is stated that the actual price of the body paper in this country is 3½d. per lb., it will be seen that there is no room for the British chromo board when it comes to a question of cost. Indeed, as a papermaker puts it, at this rate the British coated maker is helplessly and hopelessly beaten. Unless something is done to check the unrestricted free importation at prices very much below the actual cost of production in this country, it is suggested that the home manufacturer might as well close down altogether. The situation certainly places British concerns in a very disadvantageous position to say the least of it. In fact, the process, if continued, would be one of slow but inevitable strangulation.

* * *

Paper Substitutes.

A GOOD deal of attention is being centred on other uses to which paper is and may be put, all of which mean economy and health. Serviettes of paper are already very familiar. Paper handkerchiefs would be another means of avoiding infection from colds. Generally paper "textiles" appear to be coming into more popular employment, and the prejudice against them is steadily wearing down. Paper blinds have long been in use, and a new type, with a fabric edge to prevent tearing, is being introduced. On the grounds of convenience and price, there should be a great vogue for them. These are but a few of the more recent departures which paper substitutes are taking, but they indicate an ever-growing utilisation of paper, with reacting benefit upon the allied industries.

* * *

Keeping Its End Up.

COMPARED with industry generally, papermaking in this country is keeping its end up fairly well. Several influences are at work in depressing business—political and seasonal—but they are bearing more heavily on other industries than paper. For some time the percentages of unemployment have borne this out, and it is still the fact that papermaking has some 6·7 per cent. of its people out of work compared with a general figure of 11 per cent. Since April there has been a slight improvement in employment in the paper industry, although May and June were stationary. A similar state of things has existed in manufactured stationery and in printing. But for the set-back which other branches of activity have experienced, those engaged in the manufacture and commerce of paper would have enjoyed a larger measure of prosperity. Now the holiday season is full upon us and little improvement can be expected until the autumn. It is, however, some satisfaction to know that the basis of trade is regarded as sound, that we have passed the trough of the depression, and that the later months of the year must bring a brighter state of affairs.

THE *British and Colonial Printer and Stationer* circulates all over the world.

Digitized by Google

Personal.

WHEN the Prince of Wales, as President of the British Empire Exhibition, entertained a small party to luncheon on Friday at the exhibition grounds at Wembley, a large number of newspaper proprietors were amongst those who had the honour to receive invitations.

SIR ISREAL GOLLANCZ, Litt.D., F.B.A., has received the honorary freedom and livery of the Stationers' Company, in recognition of his services on the occasion of the First Folio Tercentenary.

SIR ROBERT BRUCE, editor of the *Glasgow Herald*, has been recommended for the presidency of the Burns Federation. Dr. M'Naught will continue to act as editor of the *Burns Chronicle* for another year.

SIR EVAN SPICER, a former chairman of the London County Council, and Lady Spicer celebrated their golden wedding on July 31st by giving a reception at their house in Gallery-road, Dulwich.

MR. H. SEYMOUR BERRY has been appointed by the King a Knight of Grace of the Order of the Hospital of St. John of Jerusalem in England.

MR. G. H. ROBERTS, M.P., who was secretary of the Typographical Association for many years, and who entered Parliament as a member of the Independent Labour Party, has now decided to identify himself with the Conservative Party.

MRS. WINTRINGHAM, M.P., has just joined the board of directors of *Time and Tide*.

MR. FRED MILLER, M.A., of the editorial staff of the *Daily Telegraph*, has been appointed editor of that journal in succession to Sir John M. Le Sage.

A VERY satisfactory response is being made, we hear, to the appeal for funds in aid of a presentation to Mr. R. A. Austen-Leigh, M.A., late president of the Federation of Master Printers, in recognition of his outstanding services to the whole printing industry. We understand that the form the presentation will take has not yet been decided upon, though the gift of his portrait in oils has been suggested.

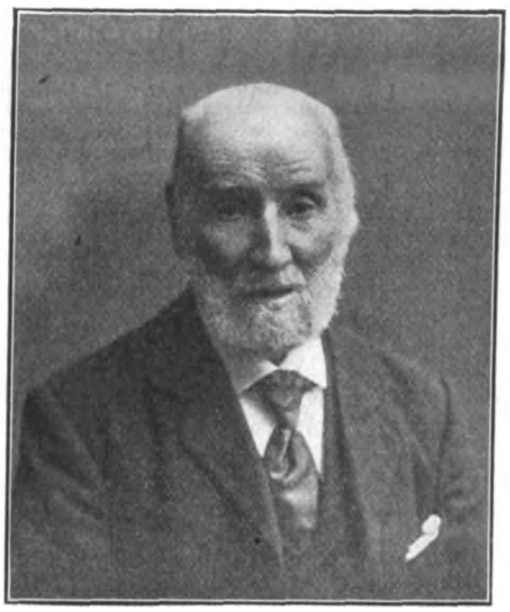
MR. C. H. LOW, accountant at the Master Printers' headquarters, 24, Holborn, was successful in obtaining a first-class pass in costing at the recent examinations of the Stationers' Company and Printing Industry Technical Board.

AFTER fifty-nine years' association with the *Lincoln, Rutland and Stamford Mercury*, Mr. Edward Joyce, J.P., Stamford, retired on Tuesday from the managership.

MR. L. L. CROOK, who for 37 years has been a member of the literary staff of the *Surrey Advertiser*, has been presented with a suit case and fountain pen on his retirement. The presentation was made by the editor, Mr. W. J. Oakley.

MR W. BEMROSE, who was recently appointed chief reporter of the *Sheffield Independent* has resigned his seat on the Executive Council of the National Union of Journalists.

MR. CONDE NAST, publisher of *Vogue* and *Vanity Fair*, was to have sailed for America in the ss. "Majestic" on the 25th ult., but was attacked with pneumonia. His physicians say that it will be two or three weeks before he will now be able to leave. He is progressing favourably.



MR. DARD HUNTER, who takes such a unique interest in hand-made papermaking, is about to issue a volume on "Old Papermaking and the Watermarks of the Old Papermakers." It is for limited circulation (200 copies) and the type and paper will alike be of Mr. Hunter's own manufacture.

THIS, the third, volume from the private press of Mr. Hunter, represents 15 years of research and, like its predecessor, represents in its entirety the labour of one man.

Seventy Years with the L.S.C.

The distinction of being the oldest member of the London Society of Compositors belongs to Mr. James Alison, a portrait of whom, together with a few bibliographical particulars we are able to give by courtesy of the *L.T.J.*

Mr. Alison was born in Leith in 1831, and is therefore now in his 93rd year. He served his apprenticeship with Messrs. Reid and Sons, of Leith, and afterwards took up employment with Messrs. Johnston and Hunter, of Edinburgh. Like other worthy Scotsmen, before

Mr. James Alison.

and since, he came to London, his first (and last) situation being with Messrs. Clowes and Sons. He was then only 22 years of age, and took up his card in the L.S.C. immediately on his arrival in London—in August, 1853. Remaining with Messrs. Clowes for over fifty years, Mr. Alison declared on the superannuation fund on his birthday, May 14th, 1907, at the age of 76, sixteen years ago.

In spite of his great age, Mr. Alison is in possession of all his faculties; he writes with a fairly firm hand and is still happy, hale and hearty.

Master Printers' Federation Emblem.

At a recent meeting of the Council of the Federation of Master Printers, decision was made upon an emblem for Federation use. We are able to show herewith an example of the simple but effective design that was selected. This emblem, it is intended, shall

appear upon the official publications, circulars, letters, etc., of the Federation, its alliances and associations, and it is hoped also that individual members of the Federation will make wide use of it. Electros, we understand, are now being made and will shortly be obtainable, price 2s. 9d., from the secretary of the Federation.

EUROPEAN MARKETS CLOSED.—On behalf of the Industrial Group in the House of Commons Sir Allan Smith (chairman) and Mr. P. J. Hannon (hon. secretary) have sent a letter to the Prime Minister expressing "the grave apprehension with which the Group regards the present volume of unemployment and the prospects of the coming winter." After pointing out that the unemployed on the live registers of the Employment Exchanges on July 9th numbered 1,189,100, in addition to the many thousands on short time, the letter states that, in consequence of the situation in the Ruhr, European markets are closed and orders are being cancelled, and that markets in the East are entirely shut down.

Zululand Newspaper Enterprise.

The *Zululand Times* has the distinction of being the only newspaper printed in Zululand. It is published at Eshowe by Mr. T. G. Tallentire, the proprietor, who went to South Africa 20 years ago, joining Mr. T. Parkins, the manager of the Church of England Mission Press. Owing to changes in the latter organisation, Mr. Tallentire acquired the paper, established some seventeen years ago, and its present day success is solely owing to his enterprise and initiative, the circulation covering a wide field. In the early days, with primitive plant, the labour involved in printing was excessive—for instance, four workings were necessary instead of one—but with the introduction of more modern machinery and trained native labour in the art of typesetting, a weekly paper, taking the form of an 8 pp. double demy, is now produced containing excellent reports of local industries and current events, and is brought out to time with the utmost regularity for postal dispatch over the entire country.

The printing office is built of wood and iron and during the summer season the heat is very oppressive. It is not unusual for boy natives to be employed in saturating the roof, covered with bagging, with water to cool the inside atmosphere.

In addition to printing and publishing the *Zululand Times*, Mr. Tallentire has installed quite a modern plant for commercial printing. Here again, considerable enterprise has been shown in cultivating the taste of the sugar mills and farmers in the matter of publicity. Every attention is evidently given to the requirements of the business man of Zululand, who finds, compared with other printing centres, that the Tallentire Press well holds its own in competition.

Mr. Tallentire has been spending several months in the United Kingdom, renewing former acquaintances, and incidentally getting into touch with the latest phases of the printing industry. He is returning home shortly on the "Balmoral." In conversation with one of our representatives Mr. Tallentire mentioned that he imported most of his paper requirements from the United Kingdom. He has also arranged to instal a stereo plant, recently purchased in this country. As far as the paper industry locally is concerned, kraft paper is produced, and considerable attention has been given to available fibres, particularly bamboo.

Mr. Tallentire takes a keen interest in all that affects the general welfare of the country. He is a member of the Newspaper Press Union of South Africa, serving on the executive council, and he has attended conferences at East London, Cape Town, Johannesburg, Durban, etc. He is a Commissioner of Oaths, and is also on the Board of Visitors in connection with the Eshowe Juvenile Male Reformatory.

It is interesting to mention that Mr. Tallentire is an old pupil of St. Bride Institute, the instructor at that time being Mr. W. S. Wilson. During his absence in England Mr. C. W. Riddell, whose services are greatly appreciated by Mr. Tallentire, has been in charge of the Zululand printing works. Mr. T. Parkins, previously mentioned as being the head of the Church of England Mission Press, formerly hailed from St. Albans.

Craft Lectures.

Under the auspices of the Stationers' Company and Printing Industry Technical Board a series of six technical lectures have been arranged to be held during the coming winter at Stationers' Hall. The lectures are planned for the second Friday in each month, from October to March, the first of the series being given on October 12th by Mr. R. A. Austen-Leigh, M.A., who will take as his subject "The Romance of the Printing Craft." The other lectures are: "Photo-Mechanical Typesetting," by W. B. Hislop; "Printers and their Metals," by A. H. Mundey; "The Evolution of Lithography," by P. B. Melling; "Printing in Foreign Lands," by Rev. A. Taylor, M.A.; "Bookselling," by J. G. Wilson.

WILL readers note that the telegraphic address of Messrs. Stonhill and Gillis (publishers of the *British and Colonial Printer* and *World's Paper Trade Review*) has been altered to "Stonhill, Lud, London."

DIVIDENDS AND REPORTS.

"LIVERPOOL DAILY POST."—Directors have declared interim dividend of 2s. per share on ordinary shares for half-year to end of June, against 1s. 6d. per share a year ago.

LAMSON PARAGON SUPPLY. — Half-year's dividend on 10 per cent. preference shares has been declared.

COLTHROP BOARD AND PAPER MILLS.—Profit £2,244 after providing £22,118 for depreciation, making available £6,128. Directors regret that profit is insufficient for dividend to be paid.

GUARD BRIDGE PAPER CO.—Directors recommend that dividend on preference shares for half-year ending June last be at rate of 5 per cent. per annum and 7s. 6d. per share for same period on ordinary shares, which, with interim dividend, makes 10 per cent. for year against 5 per cent. previous year.

BROWN, STEWART AND CO.—Report for year to end April last states that after charging £7,395 for depreciation, there was loss on year's working of £25,194, which increases debit balance carried forward to £52,627. No preference share dividends have been paid for the 2½ years ending April 28th last.

NEW COMPANIES.

RICHMOND PRESS, LTD.—Capital £100; printers, engravers, newspaper proprietors and publishers, advertising contractors, etc. Private company. First directors: J. Stones and Alexina A. Thomson. Registered office: 3A, Old Palace-place, Richmond.

MONOTYPING SERVICE, LTD.—Capital £1,500; typesetters, lithographers, stereotypers, electrotypers, letterpress printers, stationers, music, photographic and intaglio printers, etc. Private company. Permanent directors: F. K. Harlow, E. H. Diprose and A. G. Jackson. Registered office: 9, Gough-square, E.C.4.

CLASSIC ART CO., LTD.—Capital £100; publishers, printers, colour printers, lithographers, collotype printers, box-makers, stationers and bookbinders, to purchase and sell copyright in art pictures, to act as advertising agents, etc. Private company. Subscribers: C. W. Wells and C. C. Darton. Registered office: Terminus Chambers, 6, Holborn-viaduct, E.C.

CALLAN, OSBORNE AND CO., LTD.—Capital £3,000; printers, lithographers, rulers and account book manufacturers in Leeds and elsewhere, etc. Private company. First directors: T. Callan, J. Callan and W. Osborne.

GEORGE LEATHER AND SON, LTD.—Capital £2,000; to take over the business of paper stock and metal merchants carried on by Fanny Leather and John W. Parry, at 225 and 227, Vauxhall-road, Liverpool, as "George Leather and Son," together with all the assets in connection therewith except the said premises. Private company. Permanent directors: G. Leather and J. H. Edwards. Registered office: 227, Vauxhall-road, Liverpool.

BUSINESS SYSTEMS, LTD.—Capital £6,000; office and business system specialists, organisers and advisers, etc. Private company. First directors: H. T. Ratnett and Mrs. A. C. Ratnett. Registered office: 11, Cank-street, Leicester.

STENTYPE MACHINE CO., LTD.—Capital £8,000; to acquire and turn to account any invention relating to duplicating and printing machinery, office furniture and equipment, etc., carbon papers, stencils, inks, etc. Private company. Permanent directors: R. C. Adams and A. E. Skidmore. Registered office: 48, Clerkenwell-green, E.C.

CHANDOS PUBLISHING CO., LTD.—Capital £500; proprietors and publishers, newspapers, journals, magazines and books, etc. Private company. First directors: Capt. R. V. Dixon, W. Buchanan-Taylor and B. Bennion. Registered office: Ancaster-house, 42 and 43, Cranbourn-street, W.C.2.

BUTLER AND TANNER, LTD. — Capital £80,000; to acquire the business of printers carried on at Frome as "Butler and Tanner," to adopt an agreement with R. R. Tanner, Ellen Tanner, G. H. W. Cruttwell, H. R. Tanner, A. F. Bainbridge and D. V. Tanner, and to carry on the said business and that of lithographers, typefounders and setters, photographic printers, photo-lithographers, stationers, advertising and newsagents, etc. Private company. First directors: R. R. Tanner, H. R. Tanner, A. F. Bainbridge and L. V. Trotman.

FRED PURKIS, LTD.—Capital £4,000; to acquire, as from December 31st, 1922, the business of a wholesale stationer and toy dealer of Fred Purkis as now carried on at 65, Edgbaston-street, Birmingham, and to carry on the business of wholesale stationers, printers, envelope manufacturers, cardboard and box manufacturers, paper, paper bag and account book makers, manufacturers of and dealers in wood, leather, linen, celluloid, metal or glass toys, and fancy goods, picture frame, box and packing case makers, etc. Private company. Subscribers: F. Purkis and Mrs. O. L. Purkis. Registered office: 65, Edgbaston-street, Birmingham.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

RICHARDSON AND BROWN, LTD. (printers, stationers, etc.).—Mortgage dated July 10th, 1923, to secure £200, charged on land and dwelling house No. 128, Great Jackson street, Hulme, Manchester, subject to an apportioned yearly rent charge of £3 5s. Holder: T. Bowman, 58, Bolton-road, Pendleton.

ENOCH AND SONS, LTD. (music publishers, etc., London).—Issue on July 10th, 1923, of £100 debentures, part of a series already registered.

DE GRUCHY AND CO., LTD. (stationers, printers, etc., London).—Satisfaction on July 4th, 1923, of debenture dated January 11th, 1921, securing £500 forming part of a total issue of £2,000.

SUNDERLAND POST CO., LTD.—Satisfaction (a) in full on September 17th, 1908, of trust deed dated December 2nd, 1902, securing £2,500 and (b) to the extent of £3,780 (being amount issued) on October 20th, 1907, of trust deed dated December 2nd, 1902, securing £3,950. (Notices filed July 21st, 1923).

NATIONAL CARDBOARD BOX MANUFACTURING CO., LTD.—Debenture dated July 17th, 1923, to secure £500, charged on the company's property, present and future, including uncalled capital. Holder: Mrs. T. Richman, 75, Canfield-gardens, Hampstead, N.W.

LYLE BARRS AND CO. (OFFICE EQUIPMENT PRINTERS), LTD. — Satisfaction in full on June 14th, 1923, of debentures dated November 18th, 1908, securing £300

PORTEOUS, LTD. (printers, in colours, wholesale manufacturing stationers, etc.).—Two land registry charges on 5 and 6, Bury-street, St. Mary-axe, E.C., both dated July 11th, 1923, to secure £7,500 and £700 respectively. Holders: Barclay Bank, and G. H. Boyce, 12, Stratford-place, W.1.

FAR AND NEAR PUBLICATIONS, LTD.—Particulars filed of £5,000 first and £1,150 second debentures authorised June 29th, 1923, charged on the company's undertaking and property present and future, including uncalled capital, the amounts of the present issues being £1,180 and £1,067 respectively.

F. J. PARSONS, LTD. (printers, publishers, etc.).—Particulars filed of £40,000 debentures authorised June 18th, and covered by trust deed dated June 30th, 1923, charged on various properties in Hastings, Bexhill and Folkestone, and company's undertaking and other assets, including uncalled capital, the whole amount being now issued. Trustees: A. Blackman, F. W. Coles, Margaret Olives Parsons and E. A. Parsons.

J. E. BEALE (stationers, printers, etc.).—Further charge and mortgage on 2, 3, 4 and 5, Church terrace, Bournemouth, dated May 24th, 1923, to secure all moneys due or to become due from the company to Lloyd's Bank not exceeding £20,000. (Registered July 11th, pursuant to order of court).

DAILLEY AND CO., LTD. (table stationers, manufacturers, etc., London).—Land Registry Charge on 230, Dalston-lane, Hackney, and land in rear, dated June 22nd, 1923, to secure all moneys due or to become due from the company to Westminster Bank, Ltd.

MOORE AND SONS (SKEGNESS), LTD. (stationers, etc., Nottingham).—Particulars filed of £1,000 debentures authorised June 28th, 1923, charged on the company's property present and future, including uncalled capital, the whole amount being now issued.

Loxley Bros., Ltd.

At the third annual meeting of Messrs. Loxley Brothers, printers and publishers, of Sheffield and London, held in London, Mr. J. B. Morrell, chairman of the company, presiding, it was stated that despite the slackness of trade in Sheffield, and the trouble in the printing industry during last year, the trading profit for the year was considerably better than for 1921-22. The London section of the business also showed progressive results.

In the course of his speech, the Chairman said that on the trading account the net profit for the year, after paying income-tax and corporation profits tax, and providing for depreciations on the same scale as in the preceding year, was considerably greater. He was glad to say that the number of shareholders continued to increase, and that the price quoted for the preference shares was steadily appreciating.

The report and balance-sheet were unanimously adopted, and the retiring directors and auditors re-elected.

A dividend of 8 per cent. on the preference shares has been declared.

A Paper Company's Debts.

An application for an order of discharge was made on July 17th to Mr. Registrar Mellor at the London Bankruptcy Court, on behalf of Eleanzor Shinegold, described as a paper agents' clerk, residing at 105, Osbaldeston-road, Stoke Newington. The official receiver reported that the only liability was one of £1,252, which had been admitted for an unsecured balance of £352, whilst the only asset disclosed was a bad debt, £500. In April, 1920, the applicant entered the employ of a firm of paper agents and manufacturers trading at 33, Eastcheap, under the style of "George

Digitized by Google

Harrison." He guaranteed in February, 1922, the firm's overdraft up to £1,200, and as security, deposited deeds of his leasehold residence, valued at £900. He had no interest in the firm, and his only object in guaranteeing the overdraft was to help the firm in the hope that they would help him. The business was taken over by a limited company in July, 1922. The applicant attributed his failure to his having become guarantor for the said overdraft. The discharge was granted subject to a judgment for £5, to be satisfied by an immediate cash payment.

Irish Paper Contracts.

Petition to Appeal in "Freeman's Journal" Case Dismissed.

At the Judicial Committee of the Privy Council on July 25th, the *Freeman's Journal* (1919), Ltd., sought leave to appeal from judgments of the Court of Appeal of the Irish Free State in cases in which the *Freeman's Journal* were sued by two paper manufacturers, Follum Traesliberi and Fernstrom, for breach of contracts for the supply to the *Journal* of very large quantities of paper. In one case in the court of first instance the jury disagreed and the judge entered judgment for the plaintiffs for £165,000. In the other, judgment was entered for the plaintiffs for £70,000. When the cases reached the Court of Appeal, the court ordered a new trial in the first case and dismissed the appeal in the second.

Sir John Simon, K.C., for the *Freeman's Journal*, said the dispute in both cases was whether the petitioners were liable for the three alleged purchases of paper. There was no ordinary contract, but only a document counter signed by a gentleman named Edwards, one of the directors of the paper. Mr. Edwards was minded to go in for an enormous speculation in paper, quite beyond what could possibly be part of the ordinary activities of the company; but though he signed this document, there was no evidence which would bind the *Freeman's Journal*. The chairman of the company knew nothing about the transaction except what he learned at the board meeting. The mere fact that one director signed a paper could not bind a corporation, especially when the transaction was widely outside the ordinary transactions of the company. He contended that the Court of Appeal should have entered judgment for the *Freeman's Journal*.

Their Lordships dismissed the petition with costs.

British Stationery Co., Ltd.

Mr. Justice Lawrence, in the Companies Winding-Up Court on July 24, made an order for the compulsory liquidation of the British Stationery Co., Ltd., on the petition of John Dickinson and Co., Ltd.

Mr. Sims (for petitioners) said they were creditors for £248, and the debt was not disputed. So far as he knew, no notice to support or oppose the petition had been given.

"PHOTOGRAVURE INKS" is the title of a handsome compilation issued by Messrs. B. Winstone and Sons, Ltd., 100 and 101, Shoelane, London, E.C., the volume being prepared with a view to giving practical assistance to users of inks for photogravure printing. Realising the already demonstrated possibilities of photogravure, Messrs. Winstone have made careful choice of materials and mediums, coupled with the use of modern grinding machinery, in order to produce inks smooth in character, clean in working, of efficient drying qualities in all shades of colour, and free from ingredients affecting the cylinders in any way. This volume, a large quarto in format, contains over 30 photogravure plates, including one very handsome example of three colour gravure. These plates, produced with Winstone's inks, engraved and printed by the Sun Engraving Co. on papers by Messrs. John Dickinson and Co., not only show the excellence to which photogravure can attain, but should also be of practical use to printers wishing to study the effects of different combinations of ink, paper and subject matter in photogravure illustrations.

Employment in Allied Industries.

Reports Indicate Improvemeet.

Reports would seem to show that employment in the paper and allied industries is no worse; indeed, in some respects there is an improvement. Encouragement is to be derived from the unemployment chart in the *Labour Gazette*. This demonstrates that during the last year and a half, although there have been reactions, the general trend has been in the direction of a larger absorption of labour. For example, the year 1922 began with a percentage of unemployed of 16·5, and it closed with the figure at 14. Since the commencement of 1923 there has been a further decline to 11 per cent. In the case of papermaking and the allied industries the rate is less than this. The important point, however, is that generally the tendency for eighteen months has been a reduction of unemployment.

The official report concerning employment in the paper trade in June is that this was fairly good on the whole, and showed an improvement as compared with the previous month. Some slackness was reported in the hand-made section. With letterpress printers employment showed some improvemet in London, and generally continued fair in the provinces, though there was a decline at Birmingham. It continued good with electrotypers and stereotypers in London. In the lithographic printing trade employment was generally reported as slack, though at several centres, including London, it was somewhat better than a month earlier. Lithographic artists were fairly well employed. Employment with bookbinders remained slack, and much short time was worked.

It is not possible to make statistical comparison with the previous month, but it would appear as though the figures of unemployment were approximately the same. In paper and paper board making there were 3,878 persons unemployed, of whom 2,854 were men. Workers in cardboard boxes, paper bags and stationery who were idle numbered 4,094. Printing, publishing and bookbinding furnished the figure of 12,910. Wall-paper making and paper staining accounted for 252.

The Cornwall Press, Ltd.

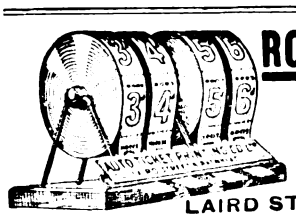
Machine Managers' Outing.

A merry party assembled at London Bridge Station on Saturday the 21st ult., for the annual outing of the machine managers of the Cornwall Press. Inks, oils and burst rollers were for the time being forgotten and the brilliant sunshine contributed to make everyone remember that "Men are but boys grown up."

Over 50 embarked for Tunbridge Wells, where on arrival the mineral springs were sampled. After a brief interval the journey was continued to High Rocks Hotel, and a visit was paid to the famous cliffs. Long before Caxton thought of a printing press or Benjamin Franklin was working one at St. Bartholomew's-close, the forces of nature were engraving themselves upon these rocks and have left a phenomenon behind as impressive as any in this country.

Full justice was done to the excellent luncheon provided, after which the "Autocar" charabancs were boarded for one of the most delightful excursions through 40 miles of valleys and ravines one could wish for. There was plenty of good humoured comparison between those who championed the respective merits of their own counties, and the claims of cricket and hops over Shakespeare was a knotty point left for future settlement.

Tea was partaken of on the return to the hotel, after which the company settled down to a musical evening presided over by Mr. J. Griffiths, works manager. The merry party did vocal justice to the chorus songs, especially "Apple Dumplings," contributed by the vice-chairman, Mr. A. J. England, and the toasts submitted were enthusiastically received. Several veterans were prominent with vocal efforts, which were continued on the saloon journey homewards. The stewards, Messrs. Shepherd and Elliott, worked assiduously—"with their coats off"—and came in for a special mede of praise.



Ald. D. James Davies.

His native town, the local printing trade and the printing industry as a whole all sustain a loss by the death of Ald. D. James Davies, who was for 31 years the editor of the *South Wales Press*, Llanelly, and who had been a member of the South Wales and Mon. Master Printers' Alliance since its inauguration. His demise, which occurred on July 11th, was not altogether unexpected for he had been ill for several weeks, and his condition became more grave as time went on. Ald. D. James Davies was, at the time of his death, president of the Carmarthenshire Master Printers' Association, and was managing director of the firm of Messrs. James Davies and Co., Ltd., of Llanelly. In directing the policy of the *South Wales Press*, Ald. D. James Davies religiously observed its motto "Be Just and Fear Not" and every cause that he espoused he championed fearlessly and courageously. A native of Llanelly, he passionately loved it, and one of his chief missions in life was its advancement. He was a rotarian, and by precept and example carried out the ethics of the Rotarian movement, and endeavoured in public life to be a living example of the Rotary motto "Service Not Self." Ald. D. James Davies started his public life in 1898 when he became a member of the Llanelly Urban District Council, and at each subsequent election was again returned a member. From 1904 to 1906 he was chairman of the Urban District Council and Harbour Commissioners, taking a foremost part in propounding schemes for the advancement of the town and port. In 1910 he was chairman of the Harbour Trust. It was with characteristic energy that he pushed on the incorporation of the town of Llanelly, and when the Charter of Incorporation was granted he stepped aside so that the honour of Llanelly's first mayoralty should be paid to the late Sir E. Stafford Howard, K.C.B. Ald. D. James Davies became Mayor in 1916 in succession to Lady Howard and acted as the town's Chief Citizen until 1918. During the War his duties were of a multitudinous character and although the strain told in the end upon his physique he never shirked his duties. The list of those duties is too long to mention here, and the town of Llanelly, the South Wales and Mon. Master Printers' Alliance, and the printing trade generally, have lost a man who served his town and his calling well, and we owe the late Ald. D. James Davies a deep debt of gratitude. The editorship of the *South Wales Press* now devolves upon Mr. Walter C. Davies, brother of the deceased, in addition to the management of the printing works of the firm, which duties Mr. Walter Davies has been carrying out for some years.

THE Intertype Book, issued by Intertype Ltd., of 15, Britannia-street, King's Cross, bears on its cover a large half-tone illustration of the Intertype wide measure display composing machine fitted with electric metal pot, six quick-change magazines, outside galley, four moulds and many other Intertype features. The pamphlet contains also many details of the equipment provided, and examples of various classes of work accomplished by the Intertype machine.

THERE were three fatal accidents in the paper, printing, etc. group of trades during June.

Trade Notes.

PARTNERSHIP has been dissolved between F. J. Breed and H. E. Webb, printers, Alexandra-road, Hemel Hempstead, Herts, who have carried on business under the style of Messrs. Breed and Webb.

IN the Companies Winding-up Court on Tuesday, Mr. Justice Lawrence made an order for the compulsory winding-up of Mayfair, Ltd., on the petition of Smith's Printing Co. (London and St. Albans), Ltd.

MESSRS. FREDK. ULLMER, LTD., of Great Saffron-hill, London, E.C.1, have just acquired the entire plant and equipment for the manufacture of wood type and printer's joinery of Messrs. John Meerloo and Sons' factory at Walthamstow. Mr. Percy H. Paul, who for nearly three years has been in charge of the factory, is continuing the management. He has had a lifelong experience in the trade and was a member of the original firm of J. C. Paul and Son.

BINDERY WAGES.—The provisional agreement which we published last week regarding wages and conditions for certain binding, folding and stitching machines has now been ratified by both the parties—the London Master Printers' Association and the London Central Branch of the Paper Workers' Union.

A FRIENDLY settlement was reached in the High Court, in an action in which Major R. V. S. Stanley sued Mr. G. Harnett, sports writer, and Mr. H. J. Nevill, printer and publisher of the *Pall Mall Gazette* for damages for alleged libel contained in an article.

UNDER the presidency of Viscount Burnham, a Committee has been formed to organise a presentation to Mr. C. J. Drummond, J.P., in appreciation of his public work over a long course of years. The intention is to purchase a small annuity for the benefit of Mr. and Mrs. Drummond. Alderman Sir Rowland Blades, Bt., M.P., is the treasurer, and Mr. Albert Bennett, Mr. Alfred Blades, Mr. F. H. Caslon, Mr. Horton Harrild, Mr. G. W. Jones, C.C., Mr. Walter Judd, Sir Herbert Morgan, Major R. Rigg, J.P., Alderman Sir William Treloar, Bt., Col. and Alderman Sir Charles Wakefield, Bt., and Alderman Sir William Waterlow are acting on the committee.

THE L.M.P.A. has just issued new editions—1923-4—of the "List of Council, Committees and Members of the London Master Printers' Association," and of the "Handbook of the London Master Printers' Association," the latter containing much information as to London wage rates and conditions, rules of the Master Printers' organisations and other matter of importance to London printers.

THE Leicester Chamber of Commerce weekly report states that the printing and bookbinding businesses, for which Leicester is an important centre, have had a downward tendency of late. Nevertheless, reports show that this city compares favourably with other printing and publishing centres.

PRINTERS' SPECIMEN EXCHANGE.—A suggestion worthy of enthusiastic support is that which the Association of Master Printers of West and North-West London is making to its members in respect of the November meeting of the Association. The idea is that the meeting should take the form of a specimen exchange, with possibly an exhibition of other printing. Members have been invited to send in specimens of their own printing, these to be not larger than Royal 4to., 200 copies of each job to be supplied in order that each member may afterwards receive a complete set of the specimens in book form. It is to be hoped that the suggestion will meet with ready response, as examination and discussion of the specimens received should provide an interesting and stimulating evening's occupation. The event is not to be a competition, but is intended to show the range of work produced by the Association's members.

THE late Major Robert Ross Balfour, V.D., bookseller and stationer, of Montrose, left personal estate valued at £5,318.

THE Civil List Pensions for the year ended March 31st last include a pension to the widow of "Spy," the artist (the late Sir Leslie Ward) and a number in recognition of services to literature.

THE Manchester and Yorkshire districts of the Institute of Journalists held a joint meeting at the Victoria Hotel, Manchester, on Saturday, with a view to their acting together in matters affecting the profession at the forthcoming general conference at Harrogate. It was suggested that the Council should inquire whether it is possible to federate all the existing literary and artistic societies. They are also to be asked to take up the question of a national scheme of superannuation for journalists, the few schemes in operation now being confined to particular offices.

THE Select Committee to whom the Matrimonial Causes (Regulation of Reports) Bill was referred issued on Monday a special report indicating the lines on which it is suggested that the freedom of the Press should be curtailed in respect of the reporting of divorce proceedings.

STARTED in July, 1823, as the *Southampton Herald*, the *Hampshire Advertiser* completed on Saturday its 100th year of continuous publication, and celebrated the occasion with a souvenir supplement.

THE cricket and lawn tennis teams of United Newspapers, Ltd. (*Daily Chronicle* and *Lloyd's Sunday News*) made their annual journey to Sittingbourne on Saturday, but the matches with players representing the paper mills of Edward Lloyd, Ltd., were completely spoilt by rain.

FOR the convenience of overseas business men who wish, during their visit to England next year, to attend both the British Empire Exhibition and the British Industries Fair organised by the Department of Overseas Trade at the White City, the date of the latter has been fixed as from April 28th to May 9th. The Birmingham section will open on May 12th and close on May 23rd.

CATALOGUES FOR S. AFRICA.—His Majesty's Trade Commissioner at Cape Town reports that a bank with its head office in Cape Town is desirous of receiving catalogues from United Kingdom manufacturers of loose-leaf ledgers. Applications for further particulars regarding this enquiry should be addressed to the Department of Overseas Trade, 35, Old Queen-street, Westminster, London, S.W.1.

COLONEL O. S. HERSHMAN, for twenty-three years owner and publisher of the *Pittsburg Press*, announces that Mr. Roy W. Howard, representing the Scripps-Howard newspapers, has bought a controlling interest in the newspaper. The sale price is said to be the largest ever paid for a single newspaper property in the United States.

THERE was a delay of three hours in the publication of Tuesday afternoon's papers in Berlin, caused by a strike of compositors over the question of wages. An agreement was subsequently reached.

A SLIGHT decrease of unemployment amongst German printers and bookbinders appears to have occurred during May. Of 62,000 members of printing trade unions reporting, 11.2 per cent. were unemployed at the end of May as against 11.4 per cent. at the end of April (1.5 per cent. at the end of May, 1922). Of 92,000 bookbinding trade unionists reporting 7.5 per cent. were unemployed at the end of May as against 8.4 at the end of April (0.5 at the end of May, 1922).

THE important Paris daily papers *Le Figaro* and *Le Gaulois* have appointed Sells Ltd., of Fleet-street, their exclusive agents for advertisements in Great Britain.

ITALIAN PRINTING.—Many handsome plates in monochrome and colour, together with numerous interesting examples of jobbing printing are included in the Italian review, "L'Arte Typografica" which reaches us from R. Scuola Tipografica Royal School of Typography, Via Carlo Alberto, 37-39, Turin. The examples shown speak well of the instruction given and of the apparatus available at the school.

THE Johannesburg police have discovered a secret printing press used for forging tram tickets wholesale. One well-known municipal official has been arrested, and arrests of others are expected to follow.

MANY Persian newspapers have been suppressed for publishing articles strongly opposing the Government.

AUSTRALIA imports at present about 100,000 tons of paper and pulp per annum, mainly from Canada and Scandinavia. The Australian Institute of Science and Industry has ascertained that by a suitable process, paper pulp of good quality can be economically produced from Australian hardwoods. This Institute has made paper with 60 per cent. of hardwood pulp of excellent quality.

SUCCESS is not made by lying awake at night, but by keeping awake in the daytime.

Trade Union Matters.

RUSKIN COLLEGE SCHOLARSHIP.—The secretary of the London Society of Compositors invites members of the Society to apply for the Ruskin College Scholarship which falls vacant this year. The College year starts on Monday, October 8th. In the event of there being more than one application, selection will be made by examination. Acceptance of the scholarship involves residence at the college in Oxford, the course of study taking up about nine months in the year. Out-of-pocket expenses will be allowed to the amount of £50.

L.S.C. AND LIMITATION OF APPRENTICES.—An official notice issued by the London Society of Compositors instructs fathers of chapels to insist on the carrying out of the terms of the new agreement on the limitation of apprentices. The proportion of apprentices allowed is one to every four journeymen, provided that one only shall be allowed for any number up to seven, two for eight journeymen, and so on up to 10 apprentices for 40 journeymen. In offices where more than 40 journeymen are employed, an additional apprentice shall be allowed for each further eight journeymen. In cases where the new proportion of apprentices is already exceeded, no further apprentices are to be engaged until the number is within the prescribed limit.

COMPOSITOR AND PRIVATE PRINTING PLANT.—The Executive Council of the Typographical Association have had under consideration an inquiry from the secretary of the Liverpool branch asking for a ruling as regards benefits and subscriptions of a member of the branch who owned a printing plant and attended cricket and football matches and printed and sold results of matches. The Executive Council have informed the Liverpool secretary that an ordinary member of the Association cannot be permitted own to a printing plant.

Opening for British Stationery.

Reporting on the economic situation in Sweden H.M. Commercial Secretary says: In a paper-producing country it is obvious that a large amount of writing paper, etc., is made and marketed here. On the other hand, large quantities of envelopes, fancy stationery, Christmas cards, etc., are imported from Germany. Much of this trade might well be done by British manufacturers.

A SPECIAL feature is made by Messrs. Edwin Thomas and Co., Ltd., of Royalty art printing paper. The body is of esparto grass, and the coating and fixing are composed of ingredients the components of which are of the very highest quality. Manufactured strictly to the firm's specification, the result is a most reliable art paper. By way of introducing it to the printer, Messrs. Edwin Thomas have adopted a striking and unique form of sample. Enclosed in a neat grey cover paper, the first four sheets give examples of colour printing on different substances, while duplicates of each sheet may be readily removed owing to perforations for sampling purposes.

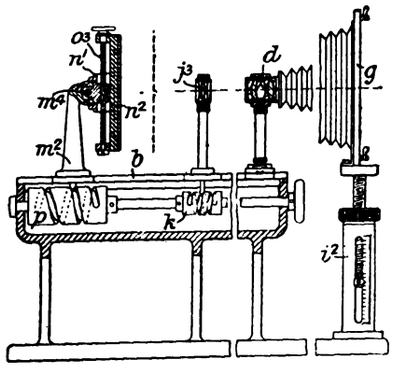
New Inventions

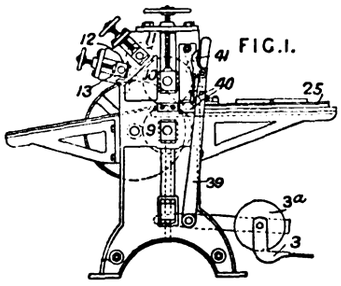
A Process Work Camera.



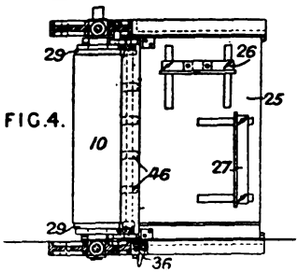
In a photographic camera for process work, as patented by Messrs. F. J. Connolly, Limited, and Mr. F. H. Salisbury, an adjustable screen-supporting frame c is connected to the back frame b by a system of lazy-tongs or double-armed levers m, m^1 so that the frame c will always be

parallel to the sensitised surface. The sides of the frames b, c may be of tubular form to hold a tension spring connecting the fixed pivots n, r to the sliding pivots t, p, respectively, and the screen adjusting means may comprise a rack z, a pinion 2, a micrometer screw 4 and an indicator 10.

Lenses for Photo-Mechanical Work.



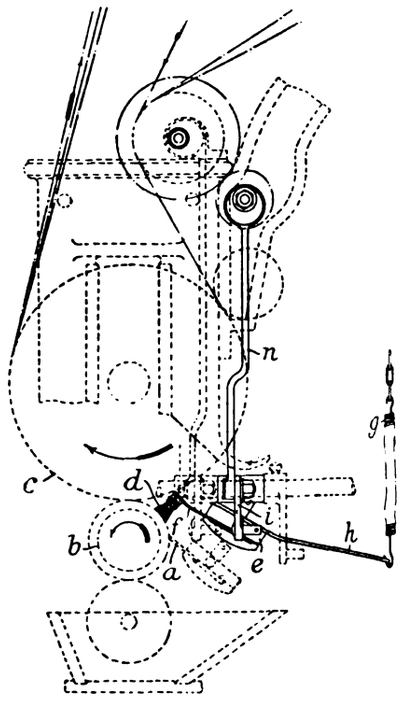
Mr. C. Zeiss has patented an invention whereby in photographic apparatus for the



production of printing plates, the lens system is of variable action. In the copying and enlarging apparatus shown the lens d is stationary and the lens j^3 adjustable. The lens d and the frame g may be connected by bellows, and the lens j^3 and holder n^2 are adjustable on the guide b. The focussing may be automatic for different ratios of reproduction by means of grooved drums k, p controlling the movements of the supports j^2 and m^2 on the guide b. The frame g is vertically adjustable in the pillar i^2. The holder n^2 is vertically adjustable on the frame n^1 by the screw o^3, and the frame n^1 is transversely adjustable on the support m^2 by a transverse screw m^4.

Tin Plate Printing.

A machine for applying designs in varnish to tin-plates, as invented by Mr. S. Barnett, comprises a feed-table 25 on which the plates are registered and advanced under spring-action when permitted by a cam 29 on the shaft of the main printing-roller 10. The plates are placed singly against the side register 26, Fig. 4, and end register 27, and rollers 46, driven by a chain from the printing-roller, assist in feeding the plates between the printing-roller 10 and an impression roller 9. The roller 10 is supplied with varnish by adjustable rollers 11, 12, and a duct 13, and the printing-surface takes the form of a patterned rubber band fixed to the rollers 10 by a



clamp at one end and by a ratchet-controlled tensioning-spindle at the other end. The impression roller 9 is moved to operative position by a lever 39, or a pedal 3 with a weight attachment 3a, and a pawl 40, operated by a handle 41, engages a rack to hold the lever 39 in operative position. The table 25 can be held out of action by a lever and safety stop 36, when it is desired to stop the feed without stopping the machine. The rollers 10, 11, 12 are adjustable by screws, and register marks on the frame are used in conjunction with screws on the rollers to enable the distances between the rollers to be regulated.

Intaglio Plate Printing.

In this invention a rotary printing machine, for printing fabric or other material from an engraved roller, is adapted to print trail or streaky effects by providing, between the ordinary doctor and the nip of the printing and impression rollers, a brush or other member adapted to remove colour from the intaglio parts of the roller and spread it in streaks or trails on the surface of the roller previously cleared by the doctor. A brush d, mounted

between the doctor blade a and the impression roller c, is carried by spring strips f from a frame e which is reciprocated longitudinally of the engraved roller b by a link from a bell-crank i operated by an eccentric rod n. The brush is pressed towards the roller b by a spring g acting on an arm h of the frame e. The patentees are the Calico Printers' Association, W. N. Molesworth and G. W. Wilson.

THE line of least resistance is not always wise. It is easier to go down hill than up.

Paper Box Wages.

An order has been made by the Minister of Labour for Northern Ireland, under Section 4 (2) of the Trade Boards Act, 1918, confirming minimum rates of wages as varied by the Paper Box Trade Board (Northern Ireland). This relates to general minimum time rates and piece work basis time rate for female workers, and specifies June 16th, 1923, as the date from which these rates are effective. The general minimum time rates (as varied) are: (*a*) 6½d. per hour for workers other than learners. (*b*) 7s. 9d. to 23s. 6d. per week of 48 hours (according to age and period of employment) for learners. The piece work basis time rate (as varied) is 7d. per hour.

"SAMPLES of British Paper made in a British Mill" is the title given to a sample book issued by the Roach Bridge Paper Co., Ltd., Samlesbury, near Preston. It is a reply to the foreign competition in sulphites, and the quality and range of these papers ought to bring success in this direction. Unbleached cap papers run from 8 to 15 lbs., and M G. pure sulphites from 8 to 40 lbs., various distinctive shades being introduced. M G. krafts are shown in five substances, from 9 to 100 lbs. All the samples (13¾ by 9½ in.) are a tribute to the quality of British manufacture and should appeal to the patriotism of home consumers.

The Standardisation of Paper Sizes.

Paper by Mr. J. Eynon read at the Gothenburg Congress of Printers by Mr. Wright, American Representative.

The United Typothetæ of America, in co-operation with several other organisations, and particularly through the Paper Size Simplification Committee of the United States Bureau of Standards, has taken an important part in the paper standardisation programme. This paper describes the development and progress of this work, and points out the benefits to be derived from it.

The first of several activities of the United Typothetæ of America in regard to standardisation was its co-operation with the National Purchasing Agents' Association in choosing the best page size for a catalogue or booklet. The 7¾ by 10⅝ inch page, decided upon in 1919, was adopted by several national associations of manufacturers for their catalogues.

The next important piece of standardisation fostered by the United Typothetæ of America concerned the sizes of cover paper. The two new sizes finally adopted to take the place of the twenty or more so-called standard sizes were 20 by 26 inches and 23 by 33 inches. These two sizes, which were approved by the Cover Paper Manufacturers' Association, have been even more satisfactory than was anticipated. One very large manufacturer of cover paper stated recently that previous to this standardisation from 70 to 80 per cent. of his orders were for special sizes, but that during the year following the volume of special orders of non-standard sizes dropped to as low as from 10 to 20 per cent.

Further, at its St. Louis Convention in 1920 the United Typothetæ of America adopted a resolution appointing a committee to standardise printing machinery as well as paper. After careful consideration of the subject of paper and machinery standardisation, the committee deemed it advisable to settle first the matter of paper sizes and grade standardisation before taking up the subject of machinery standardisation, since very little could be done with the latter until definite paper sizes had been decided upon.

Meanwhile, lithographers, stationers and users of printing, through the Purchasing Agents' Association, the Direct Mail Advertising Association, and the Association of National Advertisers, adopted similar resolutions. At this point the Bureau of Standards, through Herbert Hoover, requested the United Typothetæ of America and other associations to consider the advisability of co-operating in a programme of paper and machinery standardisation through the Bureau. A committee, known as the Paper Size Simplification Committee, was finally appointed, and held its first meeting on March 13, 1922.

RECOMMENDED SIZES.

After more than five months of research work on the part of the members of this Committee, each of the committee men co-operated in the preparation of a final report, which recommended four sizes of book papers and three sizes of bond papers. The facts upon which to base the report were secured through mailing a data book with questionnaire to the memberships of associations of buyers and users of papers represented by the various committee men.

On September 22, 1922, at a meeting of the Bureau of Standards in Washington, the report was submitted and approved by the full committee. On September 25, 1922, the report of this committee was submitted to an advisory committee made up of paper manufacturers appointed by the Bureau of Standards. This committee decided to lay the report before a committee of paper merchants, and then to release it for publication after its acceptance by the manufacturers of paper, the paper merchants, and the Bureau of Standards.

To get the data on which to base a report, the Paper Size Simplification Committee sent out twenty-one thousand copies of the booklet, "Suggestive Page Sizes," fifteen thousand of which, with fifteen thousand questionnaires, went to the members of eight national organisations and to secretaries of national organisations of manufacturers of distributors of commodities.

Fourteen different surveys were made of current printed literature in respect to sizes and fold, representing over twenty-five thousand different printing jobs. Analyses were made also of surveys of magazines, trade papers, books, directories, etc.

From the sending out of the questionnaires the Committee received only two objections to its programme. The surveys of printed literature showed that if advertisers, publishers, printers, and lithographers co-operate by changing only a portion of their present literature specifications only one-eighth inch to three-eighths inch, 87½ per cent. of the unstitched circulars, 79 per cent. of the booklets, and 86 per cent. of the cloth-bound and loose-leaf catalogues could be cut without waste from the following four standard sheet sizes of paper—viz., 26 by 39, 25 by 38, 32 by 44 and 35 by 45½, and their double sizes. If the changes were one-fourth to one-half inch, practically all the literature would come within the above four standard sheet sizes.

A WIDE SCOPE.

The Committee's recommendations to the Bureau of Standards read in part as follows: "In view of the facts given and tabulated in the foregoing pages of this report, and as a result of the nation-wide survey and thorough inquiry made by questionnaire, the members of this committee recommend to the Bureau of Standards of the Department of Commerce that production of book papers be simplified to four sheet sizes of 26 by 39, 25 by 28, 32 by 44, and their doubles, to cover virtually all general printing, publishing and advertising requirements.

"The committee also recommends that the sheet size of 30½ by 41 and its double size be adopted and recognised as a standard for the use of book publishers. The result of the inquiry made by the National Association of Book Publishers among its members and leading non-members warrants this recommendation.

"And the committee considers that the evidence produced as to present practice and the unanimity of desire for, and approval of, simplification as indicated by the answer to the questionnaires, as well as lack of criticism of the tentative recommendations, should convince the paper merchants of the country of the advisability of stocking the four recommended sizes."

As to bond and writing paper sizes, the committee recommended 17 by 22, 17 by 28, 19 by 24 and their doubles, and will soon meet with a special sub-committee to recommend a set of standards for bond and ledger paper specialities.

The Paper Size Simplication Committee also recommended that a sub-committee be appointed to further study the paper requirements of magazines and directory publishers, as well as the special requirements of lithographers, stationers, tariff printers, etc. This report is now in process of formulation.

As soon as the Bureau of Standards officially accepts the paper sheet size recommendations, and the printers, lithographers, publishers and users of printing and advertising have had an opportunity to check the final recommendations of this committee, the United Typothetæ of America and the Bureaus of Standards Committee will ask for the co-operation of the machinery manufacturers.

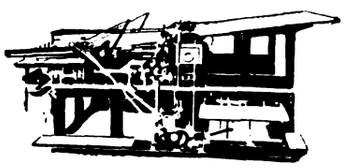
Economise by Installing



The Miehle

WHEN next you are in the market for letter-press printing machinery, fully consider the Miehle.

It may be a long time before you are again in a position to bring your press equipment up to date.

And when considering the Miehle, make a special note of the rapidity with which any job can be made ready for printing. In some cases this feature alone makes the Miehle worth two ordinary presses in actual production, but it does not cost the price of two.

Let us tell you how to economise by installing a Miehle.

paper, but through the work and influence of the War Service Committees of the Pulp and Paper industry the "American Decimal Standard of Weights for Paper" has been devised and its universal adoption urged.

The following is a brief description of the system :—

The ream is entirely eliminated, everything being figured by the thousand sheets.

The standard of size is 1,000 sheets of paper 1 inch square, and the number of thousandths of a pound such 1,000 sheets weigh, is the substance number of any particular piece of paper. For example, a paper of No. 125 substance would mean that 1,000 sheets of that paper 1 inch square would weigh 0.125 pounds, and if we should desire to find the weight per 1,000 sheets of any given size, as 25 by 38, we would first multiply 25 by 38 = 950, to find the number of square inches to the sheet. If 1,000 sheets, 1 square inch, weighed 0.125 pounds, then 1,000 sheets, 950 square inches, would weigh 950 times 0.125 pounds, or 118.75 pounds. Should we desire to find the weight of a sheet size 42 by 61, we would multiply 42 by 61 = 2,562 square inches, by 0.125, equalling 320.25 pounds, or, eliminating decimals, 320 pounds per thousand sheets.

What is the significance of these committees' findings to the printing industry? That printers do not need to stock freak sizes of paper in order to do a large and profitable business. With the sheet sizes recommended by the committee there is still afforded ample opportunity for originality and expression of individuality. Some men have the very foolish idea that originality of cut and fold is the basis of success in advertising. Probably it is this megalomania that afflicts so many advertising men, and the lack of fundamental knowledge of marketing and of clear thinking on the basis of principles, that accounts for so many of the vapid illustrations and so much of the spineless, pointless copy one is expected to examine and read.

British Papers for Canada.

Mr. Livingstone's Mission to Break New Ground.

Mr. A. MacKenzie Livingstone (Livingstone, Page and Co., papermakers' agents), sailed for Canada on August 2nd with the object of developing a market for British papers, particularly those manufactured by Messrs. Edward Collins and Sons and Messrs. Henry and Leigh Slater, Limited. At the same time he will take the opportunity of paying a short visit to the United States.

Mr. Livingstone does not think that the Canadian market has been thoroughly explored for British papers, especially esparto papers and certain British coated papers. Accordingly he proposes to examine the position for himself, and for this purpose will visit Montreal, Quebec, Ottawa and Toronto and will probably appoint agents.

Having many friends in commercial and public life in Canada, Mr. Livingstone should be in a favourable position to thoroughly test the Canadian market, and his experience will be of distinct advantage to the whole of the British paper industry. Any attempt to open a new channel for British papers should be welcomed by papermakers in this country in view of the present condition of trade.

Messrs. Livingstone, Page and Co., have recently entered into possession of their new offices at Thames House, 2a, Upper Thames-street, E.C.4. *The Times* office is opposite. The growth of the business, which has been constant since the formation just after the war, should be still further stimulated by the occupation of these very central and convenient premises.

The firm, by the way, are now sole agents for Messrs. Edward Collins and Sons, esparto paper manufacturers, Kelvindale, Glasgow, and sole export agents for Messrs. Henry and Leigh Slater, coated paper manufacturers, Bonnington and Macclesfield. With the support of these well-known British mills, Mr. Livingstone will be in a strong position to take advantage of any opening the Canadian market affords. Generally speaking, he will only offer papers which are not already manufactured in the Dominion.

Really big men love to lock arms with difficulties that would floor weaklings. They find joy in heroic effort.

Printers' Medical Aid.

Fifteenth Annual Meeting.

The fifteenth annual meeting of the Printers' Medical Aid and Sanatoria Association was held on Friday, July 27th, 1923, when in the absence of Mr. C. W. Bowerman, M.P. (who wired that he was unable to reach town in time for the meeting), the chair was taken by Mr. J. E. Simcocks, vice-chairman of the Committee.

A Fine Record.

The minutes of previous meeting having been agreed to, the report was carefully considered and showed that the income for the year was £8,521 8s. 5d., an increase upon the previous period of £335 4s. 11d. and was accounted for as follows: Subscriptions and donations, £8,201 5s.; payments by patients, £226 7s.; interest upon investments, £67 5s. 11d.; and by sale of "Gadgets," £26 10s. 4d. On the expenditure side hospitals and similar institutions cost £1,365 17s.; surgical appliances, £1,810 10s. 11d½.; convalescent homes and sanatoria, £1,394 10s. 8d.; spectacles, £2,137 14s. 9d.; massage and electricity, £248 6s.; and first aid equipment and material for same, £74 4s. 11d. The management costs were infinitesimally small, £1,430 16s. 3½d. being the amount expended. The cash in hand at the end of the year was £2,956 12s. 4¾d., an increase upon that of a year ago of £59 7s. 10d.

Letters to the number of 14,804 made up the year's issue and showed an output of 292 letters per week. The total issue since the inception of the association now numbers 101,128. The letters issued were allocated as follows: Surgical appliances, 3,416; spectacles, 8,406; special hospital letters, 2,608; convalescent homes and sanatoria, 374. There are now some 235 first aid equipments in use, and the custodians of those equipments attended to 7,214 cases of accidents.

Report and Accounts Adopted.

The report having been received, Mr. Swaffield raised the question of the supply of spectacles, and, after remarks from Mr. Langford and the secretary, it was agreed that the present arrangements for the supplying of glasses were quite satisfactory.

The report was adopted.

The statement of accounts was then considered, and, after a few words from the auditors, Mr. H. E. Deuvall and Mr. B. H. Stafford, as to the satisfactory keeping of the book and vouchers it was proposed by Mr. G. Swaffield, and seconded by Mr. J. Bailey, that they be adopted, and this was carried unanimously.

Mr. Arthur O'Connor was again elected secretary, and Mr. George A. Isaacs, J.P., treasurer. Mr. B. H. Stafford and Mr. Geo. Swaffield were appointed auditors, and the whole of the Committee were re elected with the addition of Mr. W. Bannister (Paper Workers' Union) and Mr. C. E. Maskell (L.S.C.).

The Secretary read a letter from Sir William Berry, Bart, in which he expressed his willingness to become a Patron of the Association. This was heartily received and the hope was expressed that Sir William would have a record return by his presidency of the forthcoming Printers' Pension Festival. A question regarding convalescent homes was referred to the Committee.

The ordinary business of the annual meeting having concluded, the secretary presented the

56th Quarterly Report

which, as is now becoming customary, showed further progress and usefulness. The receipts for the quarter totalled £1,923 3s. 7d. and the expenditure for the same period £1,991 4s. 9d. The number of letters issued during the quarter was large, 4,240 being the total, this bringing the total issue to date of 105,368. At the end of the quarter the funds in hand were £3,840, the investments standing approximately the same as in the annual report. The whole of the finances of the association, said the secretary, were now entirely under a sub-committee which met regularly and their assistance was a great boon to the administration side of the work. The provincial branches were approximetely the same, although movements were being inaugurated for the purpose of bringing about considerable increases in that respect. Meanwhile considerable strides had been made in London and the surrounding parts and considerable increases in members and finances were anticipated during the coming year. Mr. Bob Leathart had prepared another "Gadget" which would shortly be issued and would be possibly funnier than any previous edition. The "Old Iron Ballot" from the same gentleman's fertile brain was going exceedingly strong, and members were invited to hurry up if they required books of same. Considerable progress was reported with the second pension that the association had inaugurated and the report stated that the P.M.A. Auxiliary now numbered over 600 members, and fresh members continued to come along. The Committee proposed to send out a circular letter to the various organisations that donated subscriptions, such as trade societies, auxiliaries, etc., with a view to a better understanding and a clearer definition as to the recipients of the benefits to which such donations entitled them and quite possibly a conference upon those lines would shortly be held.

The quarterly report having been adopted, Mr. C. H. Gordon moved, and Mr. E. Chipping seconded, a hearty vote of thanks to Mr. Simcocks for presiding, and Mr. Simcocks having suitably replied, the meeting terminated.

Australian Paper Market.

Prospects for British and Canadian Products.

During an extended visit to Australia and New Zealand, Mr. W. Gorman (Provincial Paper Mills, Ltd., Canada) made a close study of the paper market in those countries.

In the early months of this year, he found trade was quiet in both countries, due to the fact that there are still large stocks bought at high prices during the war period, and also to the uncertainty of world-wide affairs. Labour conditions in Australia and New Zealand were unsettled, the labour element exercising a very wide influence in both countries. Mr. Gorman found a very strong sentiment for the Mother Country prevailing.

Mr. Gorman found Australians prepared to buy Canadian products, other things being equal. With regard to the paper trade, the people of Australia and New Zealand were great readers, and consumed a large amount of paper per capita.

At present it was almost impossible to sell news-print in Australia, owing to the fact that Canada, for tariff purposes, is regarded as a foreign country. News-print and book papers were subject to a duty of £3, whereas British productions of this class were admitted duty free. On writings, bonds, and other higher grades, Great Britain had also a preference, paying 5 per cent. *ad valorem*, and Canada 15 per cent. *ad valorem*. This difference of 10 per cent. made it very difficult for the Canadian paper mills to compete with the British mills, who bought their pulp from European countries.

Mr. Gorman says that the view of the Canadian mills is that this condition is unfair, and that Canada should be placed on the same basis as the Mother Country, in view of the fact that Canada *is* part of the British Empire. In Mr. Gorman's opinion the only hope for a big development of Canadian paper in Australia is in this country being placed on the same basis as the United Kingdom.

With regard to the paper trade in New Zealand, Canada was on the same basis as the Mother Country. Mr. Gorman believed that the prospects for the development of Canadian trade are very good, and, in fact, are proportionately greater than in Australia, owing to the fact that Canada is not under the same handicap in regard to tariff. New Zealand does not manufacture any white papers.

Norwegian Paper Prices.

The "WINKLER" Automatic Feeder

will increase the productive capacity of your Printing Machine, 25 to 50 per cent. above that of hand feeding, with better register. When feeding large sheets of very thin paper the output percentage is even higher.

SWISS MANUFACTURE.

SEPARATION of sheets by suction and blast.

Length of printing machine is not increased and access not impaired.

Feeds to register any stock from tissue to board.

Works in unison with the machine, and at any speed up to the maximum guaranteed by the press makers.

Rapid change of jobs, and therefore suitable for short runs.

No tapes or friction wheels, and therefore no marring of colours or setting-off when working colours or backing up.

The blast of air frees the sheet from dust and fluff before it is fed.

Adaptable to any type and size of sheet fed press; if desired, with a Stacking Arrangement.

Write to-day for Prospectus to the Sole Agents—

Gold Inks

(LETTERPRESS)

IF you have never yet tried Gold (Letterpress) Inks or are familiar only with those hitherto obtainable, Lorilleux and Bolton's gold inks will be a revelation to you.

No modern printer keen on cutting costs and speeding up production can possibly afford to ignore the handiness and economy they offer.

The following points show the great superiority of Lorilleux & Bolton's gold inks:—

1. They do not clog or harden on the rollers.
2. Need no specially skilled operator.
3. Are suitable for either platen or cylinder machines.
4. The machines can be run at normal speed.
5. Retain their brilliance for long periods.
6. Print the type thoroughly and heavy solids without difficulty.

Available in light and dark shades of gold as well as silver.

Write for specimen prints and generous sample tin to-day.

Trade Notes.

Messrs. Geographia (1923), Ltd., have purchased the business and undertaking of Messrs. "Geographia," Ltd., map publishers, etc, 55, Fleet-street, London, E.C.4, which business they are continuing at the same address.

It is announced in the *London Gazette* that a winding-up petition has been presented against the following company:—Vi Board, Ltd.—Petition of Dexter and Co., High Wycombe. To be heard in London on October 16th.

Arrangements have been made for the weekly *Westminster Gazette* to appear, in the autumn, under new and separate control. It will be issued in a new form from its own offices. The editor will be Mr. Ramsay Muir, and Mr. J. A. Spender and Mr. Philip Guedalla will co-operate. The price will remain at 3d.

The *Clarion* ceases publication with this week's issue, after an existence of nearly 32 years. The journal was started in 1891 by Mr. Robert Blatchford ("Nunquam") when he seceded from Hulton's *Sunday Chronicle*. He had as colleagues Mr. A. M. Thompson ("Dangle") and Mr. Edward Fay ("The Bounder").

To the August *Current Opinion*, organ of the Industrial League and Council, Sir E. J. P. Benn, Bart., contributes an article on the subject of peace in industry.

Mr. Charles E. Musgrave, secretary of the London Chamber of Commerce, who died in London at the week-end, started his career as a journalist on the staff of the *City Press* and the *Citizen*.

Lead Poisoning in the Printing Industry.—Dr. T. M. Legge, Senior Medical Inspector of Factories, has contributed a chapter on industrial diseases to the Annual Report for 1922 of the Chief Inspector of Factories and Workshops. In this contribution it is stated that last year there were eleven cases of lead poisoning in the printing industry, and no deaths. In the preceding year the number of cases amounted to twelve, and there was one death.

Railway Rates Reductions.—It was officially notified on Tuesday that the London and North Eastern Railway Co., the Great Western Railway Co, and the Southern Railway Co. intended to reduce their rates for the carriage of merchandise traffic by merchandise train (including coal, coke and patent fuel) on and from August 7th from 60 per cent. above the rates in force on January 14th, 1920, to 50 per cent. above those rates. No alteration will be made in the flat rate additions.

We have received a copy of the August issue (No. 8) of "Type," a journal devoted to printing and book production, printed and published by the Morland Press Ltd, of 140, Ebury-street, S.W.1. The 16 pages of this number are, of course, excellently printed, and there are some pleasing typographical effects. Devoted to the bookplates of Frank Brangwyn, a feature is the reproduction of several Brangwyn woodcuts. The price is 6d.

Mr. John Francis Redmond, managing editor of the *Editor and Publisher* of New York, died recently after an illness of several months. Mr. Redmond was a native of New York City and began his journalistic career on the *Fourth Estate*, transferring to the *Editor and Publisher* in 1918.

Immediately following the lightning strike of printers at Berlin, Cologne printers struck work on Wednesday of last week. Not only have newspapers had to suspend publication, but highly important work of bank note printing at Cologne has ceased. The dispute is on the subject of wages. The average weekly wage of a married compositor is 1,100,000 marks—stated to be the equivalent of a week's supply of potatoes for one small family. The unemployment dole is 1,250,000 marks, so that the men gain nothing from having work. The men demand 2,500,000 to 3,000,000 marks per week.

Paper horseshoes are said to be produced in Germany.

The fourth Norwegian Industries Fair, to be held in Christiania from September 2nd to 9th, will have one section devoted to timber, wood pulp, pasteboard, paper, etc., and another to book, paper and graphic productions.

The Soviet Government has taken a first step towards the freedom of the Press by permitting the sale and circulation of certain foreign newspapers, including the *Daily News* and *Manchester Guardian*.

Polish paper has been offered for sale in London this week.

Canada's Paper Output.—A report from Toronto, Ontario, indicates that Canada's production of paper continues to increase at a remarkable rate. In 1909 the output was 150,000 tons; last year 1,082,000 tons. At the present rate of increase Canada will be producing more news-print than the United States in a very few years.

During March imports into New South Wales of German origin included paper-working and paper boxmaking machinery of the value of £951.

The Minister of Commerce, Rumania, has published a note stating that the Rumanian Paper Mills have entirely abandoned the manufacture of "news," so that in consequence the Government is compelled to buy enormous quantities from foreign countries.

Paper in New Zealand.

Printing paper imported into New Zealand during the March quarter of this year represented 103,580 cwts., of the value of £131,158. The share of the United Kingdom of the total was 50,005 cwts. (£63,828), while that of Canada was 53,063 cwts. (£59,745). It is interesting to compare these figures with those for the March quarter of last year, when the total quantity of printing paper imported was 65,953 cwts., representing a value of £82,014. Of the total the United Kingdom was credited with 14,426 cwts. (£24,188) and Canada with 50,161 cwts. (£54,866). It will thus be seen that the United Kingdom has considerably improved her position, while Canada has experienced a slight setback.

The official *New Zealand Gazette* of May 31st published a notice concerning the removal of the embargo on German and Austrian goods. The first schedule shows that the classes or kinds of goods subject to depreciated currency duty include: Paper, writing; paper, printing; wrapping paper, all kinds, glazed, mill-glazed, or unglazed, including browns, caps, casings, sulphites, sugars, and all other bag papers, candle carton paper, tissues, and tinfoil paper, not printed, n.e.i., in sheets or rolls of any size, if, under the Tariff, liable to *ad valorem* duty.

Italian Paper Mills Amalgamate.

The two leading Italian "news" paper mills, viz, the Societa Anonima Cartiera Pirola and the Cartiera Burgo di Verzuolo, have been amalgamated under the latter style. They have four paper machines, a complete plant for wood pulp, and somewhat extensive poplar tree plantations.

Spalding's Quarterly is already numbered among the few select organs that represent the best in paper and print. Number 2, recently to hand, enhances the standard set by Number 1, and provides a second lesson in typographic excellence for the paper user who has an open mind for artistic education in his calling. We understand that it is the intention of Messrs. Spalding and Hodge to open a Manchester warehouse for the distribution of their stock in that area. They have already acquired an office and put a permanent representative in occupation. That is the only way in which to establish a sound connection in Lancashire, and a great deal more business will eventually be done by those merchants whose stocks on the spot are ample enough to meet all ordinary demands.

Etablissements Merlin and Gerin.—The profits for the past year represented 119,748 francs net, and the dividend 30 francs per share, fully paid, and 6·44 francs per half-paid share.

The capital of Papeteries et Etablissements Mougeot, Laval-devant-Bruyere, France, has been increased from 152,000 to 2,153,500 francs.

Trade Union Matters.

Loan to the T. A.—At a recent meeting of the Executive Council of the Typographical Association a letter was read from the secretary of the Leeds branch intimating that the branch were prepared to grant a loan of £500 to the Executive Council for general purposes, free of interest, for six months, to be extended for a further six months if required. The Council accepted the offer.

An official notice to branch secretaries of the Typographical Association points out that the rates of members' subscriptions have been increased by 2d. per week as from the commencement of the July quarter.

L.S.C. War Orphans.—At the quarterly delegate meeting of the London Society of Compositors on Wednesday of last week, the committee proposed and the delegates agreed; "That 1s. 3d. (per member) of the current levy for the week ending Saturday, August 4th, be allocated as a grant estimated to yield a total of £600 to the L.S.C. War Orphans' Fund." This fund, in connection with the Printers' Pension Corporation, will be in need of assistance until such time as the youngest child concerned has reached school leaving age. It is possible that, to meet the needs of the Corporation scheme during its existence, a grant from the L.S.C. will be arranged each year.

Unemployment in the London Society of Compositors was at its lowest in the week ending July 7th when 657 members signed as unemployed. In the following week the number had increased to 752, but, curiously enough, fell to 721 in the week ending July 21st. The returns for the present month will, we believe, be higher, the usual seasonal slackening of trade having made itself felt. According to the overtime returns for June, 7,176 members of the L.S.C. worked overtime totalling 86,960 hours.

Press Censorship.—At the next meeting of the London Trades Council consideration is expected to be given to the resolution on the subject of Press censorship which the Platen Machine Minders' Society brought up at the July meeting, but which had then to be held over. The resolution states that "the time has arrived when trade unions should exercise a censorship of the Press, owing to the fact of gross misrepresentation from time to time of the position of workers in trades disputes, and with this object in view the Trades Union Congress be approached to consider ways and means of enforcing same."

In respect of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers' annual Gala Day on Saturday, August 25th, at the London County Sports Ground, Herne Hill, entries for the trade events must reach the sports' secretary not later than Friday, August 10th (fees being enclosed) to 220, Blackfriars-road, S.E.1, or 21, John-street, W.C.1, or 53, Fetter-lane, E.C.1.

Canadian Kraft Paper Enterprise.

With the letting of tenders for timber cutting rights on 1,040 square miles of territory in the Sudbury and Algoma districts a new industry is heralded for Northern Ontario. The Continental Wood Products Co., Ltd., of Montreal, and Elsas, Ont., is the concern which has accepted the Provincial Government's terms in the new venture of manufacturing kraft paper, for wrapping and box making purposes, and in the agreement undertakes to have a $1,500,000 pulp mill in operation by June 1st, 1925. The company may later be called upon to construct a paper mill. The limits disposed of are known as the Trout-Chapleau pulp wood limits.

Messrs. James Hawes and Co., Ltd., have acquired the Syston Mills, near Leicester, lately owned by Messrs. W. H. Baldwin and Son, Ltd., and will there carry on the manufacture of leather boards, etc. Mr. James Hawes, the managing director, has had a long experience in manufacturing and was for some years works manager with Messrs. Baldwin. Messrs. Albert Pemberton and Co., 17, Belvoir-street, Leicester, have been appointed sole selling agents for Messrs. James Hawes and Co.

P.O. and "Trap" Envelopes.

Important Concession Granted.

A concession of very considerable importance to the commercial community has been granted by the Postmaster General, in response to representations made to him by the Employers' Federation of Envelope Makers and Manufacturing Stationers.

It may be recalled that in February last the Postmaster General announced certain restrictive regulations to be applied to "tuck-in" envelopes sent unsealed through the post at the printed paper rate. According to these regulations, an embargo was to be placed upon envelopes where the flap was merely tucked-in and which exceeded 4¼ inches in width. In view, however, of the hardship which might be caused to members of the stationery trade by enforcing this particular regulation without due warning, the commencing date of operation was postponed until the 1st January next.

This, however, did not meet the wishes of those who were interested in the matter, and further pressure was brought upon the authorities, with the result that Mr. F. L. Armstrong (secretary of the Employers' Federation of Envelope Makers and Manufacturing Stationers) has been able to inform his members that the new regulations which will come into force next year, while maintaining the general prohibition against the tuck-in envelope exceeding 4¼ inches in width, will embody a special exception, designed to protect the users of the ordinary commercial envelope by allowing "the use of small envelopes with tuck-in flap not exceeding 6 inches in width, when the depth of the envelope does not exceed 3½ inches."

The importance of this concession will be realised when it is remembered how difficult it is to change a practice which has been customary in commercial offices for very many years. The 6 inch envelope is very extensively used in all offices in the City for the transmission of communications sent not only by letter, but also by printed paper rate.

The amendment of the regulations, Mr. Armstrong informed a representative of this journal, will not only be for the convenience of the general public, but will also save the officers of the Postal Department a considerable amount of trouble, although so far as the envelope makers themselves are concerned, no doubt they can and will produce envelopes complying with the regulation as originally drafted.

The object of the Postal authorities was to prevent the trapping of other postal packages in envelopes with the tuck-in flap. While, however, the aim of the Department is met in regard to larger envelopes, the advantage is retained for the commercial community of being able to use an envelope which has been in vogue for so long, and which meets business convenience so well.

Printed Blotting Paper.

The Secretary of the General Post Office has replied as follows to an Association of Master Printers which raised a question as to the admissibility of blotting paper at Printed Paper rate:—"I am directed by the Postmaster General to inform you that blotting paper is not regarded as a substance ordinarily used for writing or printing, and there is, in strictness, therefore, no provision in the regulations for its transmission at the Printed Paper rate. As a concession, a single piece of blotting paper having an advertisement printed upon it, is allowed to pass at the reduced rate, but only provided that the advertisement does not refer to blotting paper and that the blotting paper is not sent as a sample; this concession does not in any case extend to more than one such piece of blotting paper."

UNEMPLOYMENT RETURNS.—It is officially stated that the number of persons recorded on the live registers of the Employment Exchanges in Great Britain as wholly unemployed on July 23rd was 1,184,900—4,239 more than in the preceding week but 300,978 less than the figures recorded on January 1st last. The number working short time and drawing benefit for intervals of unemployment on July 23rd was 62,100, as compared with 65,588 on July 16th and 56,261 on January 1st.

Postal Rates.

Reductions Advocated in Order to Promote Employment.

In the House of Lords last week Lord Southwark asked His Majesty's Government whether, in view of the unanimous opinion of the commercial community that an immense volume of postal communications would result from a return to the penny postage, and in view of the unsatisfactory result of increasing the weight of letter packets carried for the minimum charge of 1½d., he would now consider the desirability of reducing the minimum charge for letter packets at home and to all British Possessions, Egypt, United States of America, and Tangier to one penny, with a corresponding reduction of the weight to one ounce for inland letters and half an ounce for other parts of the Empire, United States of America, etc., thus again realising the ideal of Imperial penny postage, which, by increasing communication between this country and the different parts of the Empire, would increase trade, and thereby bring increased revenue to the National Exchequer. The noble lord suggested that the reductions recently made were not sufficient to encourage a large increase in correspondence. Now was the time to announce further reductions, as such reductions would, no doubt, lead to an enormous increase in postal business by the end of the year, with the result that there would be a reduction in unemployment and an increase in revenue.

The Earl of Lucan, in reply, said that although he could not on behalf of the Post Office quite meet the wishes of the noble lord in every respect, he thought he would find that the Post Office was not unsympathetic. He could assure the noble lord that his Majesty's Government cordially shared his views as to the desirability of re-establishing at the first possible moment the penny postage as soon as financial conditions would allow. It had been suggested that a reduction in the postal rate would lead to an immense increase in the volume of business, but he might say that the result of the reductions already made had been most disappointing.

British Empire Exhibition.

The Papermaking Exhibit.

Good progress is being made with the arrangements for promoting a papermaking exhibit at the British Empire Exhibition next year. To this end, a conference of papermaking engineers with the Special Committee of the Papermakers' Association was held in Manchester last week. As a result the co-operation was obtained of Messrs. Bentley and Jackson, Ltd., Mather and Platt, Ltd., the General Engineering Co., Porritts and Spencer, Ltd., the Watford Engineering Co., Ltd., and James Kenyon and Son, Ltd. Negotiations are in progress with one or two other firms.

Scandinavian Paper Trade.

Both from Norway and Sweden come reports of depression in the paper market.

In Sweden complaints about the depression are heard from most sections of the paper trade. Only news-print manufacturers are still fully engaged for months ahead. It might be that this slackening off of the paper business to a great extent only marks the usual summer dullness, but on the other hand there is also a marked tendency amongst the greater paper consumers and paper merchants to carry a minimum of stock, leaving the paper mills to bear the financial burden of having in store ready for prompt delivery all current sizes of their productions.

Although seasonal quietness prevails also in Norway, all mills are said to be working at full capacity, and mill owners anticipate satisfactory quantities of orders, in view of the recent development in exchange movements. The prices now obtained are declared not to be satisfactory, as costs of production are still very high.

Australian Notes.

(From Our Sydney Correspondent.)

MR. ROBERT SANDS, who has for about forty years been a director of the *Sydney Daily Telegraph*, has resigned owing to ill-health and has been replaced by Mr. J. L. Wallace, the managing director of the Sydney and Melbourne Publishing Co., Ltd.

CONSIDERABLE damage has been caused by fire to the premises of Mr. C. Jerrom, bookbinder and manufacturing stationer, Kent-street, Sydney.

THE board of Gordon and Gotch (Australasia), Ltd., has declared the following dividends: Preference half-year at the rate of 8 per cent. per annum on the amount paid up previous to September 30th last, and on those shares numbered 78,331 to 100,000 taken up since October 1st last, as from the date on which payment was received. Ordinary shares, half-year, 8 per cent. per annum.

MESSRS. LAMSON PARAGON, LTD., have declared an interim dividend at 10 per cent. per annum for the six months ending April 30th last.

MESSRS. THORNTON, HAMILL AND WINTER, LTD., have been registered as a company with a capital of £5,000, in £1 shares, as printers, publishers and stationers, Castlereagh-street, Sydney.

THE Cessnock Publishing Co., Ltd., has been registered with a capital of £10,000 to acquire all rights and interests of the *Cessnock Express*, to carry on the business of proprietors and publishers of newspapers, journals, literary works, etc., and to publish the *Cessnock Express*.

MESSRS. SMITH'S NEWSPAPERS, LTD., has been registered in N.S.W. with a nominal capital of £400,000 in £1 shares, to acquire the business now carried on by *Smith's Weekly* Publishing Co., Ltd.; to start, acquire, publish and circulate or otherwise deal with any newspaper or newspapers or other publications, etc.

THE Triad Magazine of Australia, Ltd., has been registered with a capital of £15,000 in 5,000 preference shares of £1 and 10,000 ordinary shares of £1; to purchase and continue as a going concern the *Triad Magazine* and other publications lately carried on by the Triad Magazine Ltd.

MESSRS. BERNICE AGAR, LTD., has been registered with a capital of £3,000, to acquire as a going concern, the business known as Bernice Agar, together with all assets and liabilities, and to carry on the business of photographers, photographic agents, printers, lithographers, engravers, etc.

MESSRS. W. J. CRYER AND CO., LTD., has been registered with a capital of £15,000, to acquire a certain business and carry on the business of printers, engravers, publishers, book and print sellers, bookbinders, art journalists, newspaper and magazine proprietors, newsagents, etc.

Paper Workers' Wages.

Negotiations on the National Agreement.

Negotiations took place at the Midland Hotel, Manchester, last week, between the Negotiating Committee of the Employers' Federation of Papermakers and the delegates of the National Union of Printing and Paper Workers and the Amalgamated Society of Papermakers on the question of the amendment of the National Agreement No. 3. The proposals of the employers were discussed and the reply of the unions is now to be reported to the members of the Employers' Federation for their decision as to future action.

ONE great enemy to business progress is pigheadedness.

U.S. News-Print Exports.

During April the exports of American news-print were as under to the countries mentioned:—

NEWS-PRINT.

	Pounds.	Dols.
Canada	144,990	14,966
Central America	107,485	6,058
Cuba	2,112,533	92,595
Other South America ...	170,168	9,274
China	44,566	3,445
Philippine Islands ...	269,293	12,332
Other countries	101,474	6,191
Total, Apl., 1923 ...	2,950,509	144,861
,, ,, 1922 ...	6,686,098	708,179
,, July-Apl. 1923 ...	33,002,240	1,576,643
,, ,, 1922 ...	32,974,278	1,557,175

U.S. Board Exports.

Exports of paper board and strawboard from the United States during April reached a total of 3,483,005 lbs., of the value of $187,681. Bristols and Bristol boards were sent abroad to the extent of 155,039 lbs. ($14,404).

Canada took the largest proportion of paper board and strawboard, namely, 1,530,036 lbs. ($70,611). China occupied the second place with 674,908 lbs. ($35,720), Japan coming next with 395,315 lbs. ($28,050), following by England 182,750 lbs. ($11,277) Considerable quantities of kraft were shipped to Central and South American States, but except for Mexico, none took a larger quantity than did England 84,720 lbs. ($4,966) or Australia 47,002 lbs. ($2,905).

America's principal market for Bristols and Bristol boards was Cuba with 103,129 lbs. ($6,897). A long way behind in the second place is Mexico with 13,486 lbs. ($2,168), followed by Canada, 11,142 lbs. ($1,851).

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

In the High Court of Justice
Chancery Division No. 00505 of 1923.
Mr. JUSTICE P. O. LAWRENCE

IN THE MATTER OF WARRILLOWS LIMITED
and
IN THE MATTER OF THE COMPANIES (CONSOLIDATION) ACT, 1908.

NOTICE IS HEREBY GIVEN that by an Order dated the 25th July 1923 the Court has directed separate meetings of

(1) The unsecured Creditors of the above-named Company (other than those whose debts are preferential or do not exceed £5)

(2) The holders of Preference Shares of the said Company and (3) the holders of Ordinary Shares of the said Company to be convened for the purpose of considering and if thought fit approving (with or without modification) a Scheme of Arrangement proposed to be made between the said Company and the Company's aforesaid Unsecured Creditors (other than those whose debts are preferential or do not exceed £5) and the holders of the Preference Shares and the holders of the Ordinary Shares respectively of the said Company and that such meetings will be held at Winchester House Old Broad Street in the City of London on Thursday the 23rd day of August 1923 at the times below mentioned namely:—

The meeting of the aforesaid Unsecured Creditors of the Company (other than those whose debts are preferential or do not exceed £5) at 11.30 o'clock in the forenoon.

The meeting of the holders of Preference Shares at 2 o'clock in the afternoon or so soon thereafter as the preceding meeting shall have been concluded.

The meeting of the holders of the Ordinary Shares at 3 o'clock in the afternoon or so soon thereafter as the preceding meetings shall have been concluded.

At which place and respective times all the aforesaid Unsecured Creditors (other than those heretofore excepted) and the aforesaid Preference and Ordinary Shareholders are respectively requested to attend.

Such Unsecured Creditors (other than those heretofore excepted) Preference and Ordinary Shareholders may attend such meetings respectively and vote thereat either in person or by proxy but all forms appointng proxies must be deposited with the Company at its registered office situate at Hampton House, Great Hampton Street, in the City of Birmingham not later than 12 o'clock noon on Wednesday the 22nd day of August 1923. In the case of joint holders of Preference or of Ordinary Shares the person whose name stands first in the Register in respect thereof shall alone be entitled to vote in person at the meetings. In the case of joint holders voting by proxy the forms of proxy must be signed by each of the joint holders. The person appointed to act as proxy must himself be a member of the same class as the appointor.

A copy of the said Scheme of Arrangement can be seen and forms of proxy be obtained at the aforesaid registered office of the Company.

The Court has appointed Edward Montagu of messrs Ihlee & Sankey or failing him Stanley Lane Chairman of the said meeting of Unsecured Creditors, William Studdy Hooper or failing him Percy Albert Button Chairman of the said meeting of Preference Shareholders, and William Studdy Hooper or failing him Dr. George Herbert Arthur Taylor Chairman of the said meeting of Ordinary Shareholders, and has directed the respective Chairmen to report the results of such meetings respectively to the Court.

The said Scheme of Arrangement will be subject to the subsequent approval of the Court.

Dated this 8th day of August, 1923.

THURSDAY, AUGUST 9, 1923.

The Printer-President's Passing.

THE British printing industry, we believe, felt with special keenness the surprise and sorrow conveyed last week by the news of the passing of Warren Gamaliel Harding, President of the United States of America. Mr. Harding's sudden death, at a time when he seemed to be safely on the road to recovery, removes with tragic suddenness a president who never ceased to be proud of his calling as printer and journalist. It is good to think that before he died he had already shown his capability in the high office with which his fellow-countrymen invested him, and that his record holds nothing unworthy of the craft he honoured. So recently as the annual gatherings of the Federation of Master Printers in London in May, Mr. Harding sent to the British printers his good wishes as a "fellow-printer," and the Federation promptly responded with a message of respectful greeting and appreciation. To day our respect and goodwill are mingled with regret, but there is consolation in the thought that the quality of Mr. Harding's character was in keeping with the straightness of the printer's make-up rule which he always carried with him, and that his name will ever be numbered amongst America's most honoured sons.

* * *

Inaccurate Reams of Paper.

FROM our own experience we are inclined to think that in the counting-off of reams there is less care exercised in some of our mills than there need be. On many an occasion recently we have heard complaints of short count, a serious matter in printing offices where it had become a custom to accept a ream of paper as an absolutely definite quantity. On the question of shortages disputes between departments arise, matter has to be reprinted, delay is occasioned, and, worst of all, there ensues a lack of confidence in reamage which leads to what should be unnecessary recounting. Printers and other paper users do not always report these defects to the merchant and the merchant does not always carry through reports to the mill. Foreign paper is infinitely less reliable than English in count, and here there is no redress in most cases. So far as our own mills are concerned, counting should be an automatic and foolproof process.

* * *

A Complex Position.

WHILE on the subject of ream content, it is high time that attention was drawn to the fact that the new trade custom of a 500-sheet ream is being practically ignored by those responsible for framing it. There is as much, if not more, complexity about the ream to-day than at any previous time. A few merchants have half-heartedly attempted to install the 500-sheet ream; mostly, the mills have ignored it. Printers, as a body, and with exceptions, have not sufficient interest in paper to care how it is made up so long as they get it cheap. The printers' warehouseman makes innumerable mistakes which are brought home to him in the shape of shorter overs and waste paper. All this is for the sake of an understanding. If nothing else can be done, at least the mills could stamp the number of sheets in the package in unmistakeable figures, both on the wrapper and the top sheet of the ream. That would prevent many mistakes and much wastage at the using end. And a printed label would be more efficient than a rubber stamp, which is too often subject to human error and frailty in its employment.

* * *

Strawboard Prices.

STRAWBOARD prices have eased still further. To-day's quotations for unlined Dutch boards are based on £8 17s. 6d. per ton, delivered, for substances from 6 oz. to 16 oz. For 1½ lbs. and up add £1 5s. per ton. A week or two ago certain Dutch mills withdrew quotations and the implication was that an advance was in contemplation. Actually the reverse process has been followed. At to-day's figure, foreign strawboard prices stand at just over twice the pre-war average. English box-boards remain unaltered and are meeting with a decided preference on the part of an increasing body of users. Although apparently higher in the listed price, there is little to choose in practical cost when substance and quality are taken into consideration. A point for careful consideration by large users is the fact that makings to special size, finish or colour can be put through and delivered at short notice.

* * *

Cheap Paper Offers.

AMONG recent cheap offers of foreign paper we note the following: M.G. kraft at £20 per ton; imitation greaseproof at £23 15s. per ton; news-print offcuts at £15 per ton; bleached greaseproof, fine grade, at 4¼d. per lb.; striped M.G. cap at £20 per ton; azure laid E.S. account book paper at 3¾d. per lb.; unglazed bank, £36 10s. per ton; M.G. nature, £20 per ton. Mainly, the prices are quoted at store, and railway carriage must be added.

* * *

News-Print and Export.

THE one branch of the paper industry which is credited with some measure of prosperity is that of news-print. Even here, however, complaint is made that prices are not satisfactory. Conditions are favourable to price competition, and these operate not only at home, but abroad as well. The unofficial dock strike is another factor which is helping to hold up paper business. Consignments at the docks cannot be shipped or landed; and it follows that if British paper is not available, then that which is at hand will be taken. In this way orders are lost, and business flows into another channel, from which it is not readily diverted.

Personal.

Viscount Leverhulme was admitted to the Freedom and Livery at a meeting of the Court of the Stationers' Company on Tuesday of last week.

Alderman Sir William Waterlow, the retiring president of the Marlburian Club, occupied the chair on Wednesday of last week on the occasion of the dinner of this association.

Mr. James Sykes, an ex-president of the Institute of Journalists, who for 21 years has been chief assistant editor of the *Yorkshire Post* and in all has had 30 years' service with that paper, will retire from regular work next month.

Mr. F. W. Shilling, of Norwich, has been appointed chairman of the Eastern District of the Institute of Journalists.

Mr. Kenneth McMillan, formerly of the editorial staff of the *Sheffield Telegraph*, and subsequently of the *Sporting Life*, has been appointed editor of the *Surrey Weekly Press*.

Mr. W. J. Cuthbert, the London manager of the *Newcastle Daily Journal*, has just celebrated the 25th anniversary of his wedding day.

Mr. F. G. Austin, of the Leicester School of Art, designed the new emblem (shown in our last week's issue) of the Federation of Master Printers, and he is therefore the winner of the prize of £5 offered in the competition for a suitable design.

Mr. S. H. M. Killik, J.P., one of the sheriffs of the City of London, has been re-elected a director of the Colthrop Board and Paper Mills, Ltd.

Mr. and Mrs. Joseph Chadwick, of Seymour-grove, Manchester, on Saturday celebrated their golden wedding. Mr. Chadwick, principal of Messrs. J. Chadwick and Sons, Ltd., paper bag manufacturers, Warrington, holds an unbroken record of 66 Whitsuntide "walkings" in the Sunday school processions at Mossley.

Mr. Granville Marshall is making a tour of towns in South Africa as the representative of Messrs. Charles Morgan and Co., Ltd.

Mr. Arthur Herbert has been busy with the taking over of commodious premises in Cape Town for Spicers (South Africa), Ltd.

City and Guilds Examinations.

Names of Prize-Winners.

The City and Guilds of London Institute, Department of Technology, has published a list of the prize-winners in the 1923 technological examinations organised by the Institute. The following are the prize-winners in the subjects of typography, lithography and bookbinding:—

Typography (Compositors' Work).—Albert Frank Hopper (London County Council), 1st Prize, Final, Silver Medal; Stanley Percy Brand (L.C.C.), 2nd Prize, Final, Silver Medal; James Stewart Stephenson (Heriot Watt College, Edinburgh), 1st Prize, Grade II., Bronze Medal.

Typography (Press and Machine Work).—Reginald James Nearn (L.C.C.), 1st Prize, Final, Silver Medal; Thomas Edwin George (Technical College, Cardiff), 2nd Prize, Final, Silver Medal.

Lithography—Ernest George John Winders (Municipal Technical School, Birmingham), 1st Prize, Final, Silver Medal.

Bookbinding (Forwarding).—Kenneth Holmes (Skipton Science and Art School), 1st Prize, Final, £2 (Skinners) and Silver Medal; Arthur Henry Johnson (L.C.C.), 1st Prize, Final, £2 (Skinners) and Silver Medal.

Canadians to Tour Britain.

Weekly Newspaper Men's Visit.

Plans are being completed for the projected 1924 tour of the British Isles by members of the Canadian Weekly Newspaper Association. Though the tour is to be associated with the annual convention of the Association, it is not intended to hold the actual convention out of Canada. The convention will in all probability be held in Toronto or some other convenient point and those going on the overseas trip will leave immediately afterwards.

Canadian Pacific steamships will carry the press party to and from the old country. Date of sailing has not yet definitely been arranged but it will be some time in the forepart of June and it is likely that seven weeks will be spent on the trip—that is from the time the party leaves Montreal until it returns to that port. The centre of the tour will be London. According to arrangements, however the party will first go to Glasgow and from this point will commence a tour of Scotland by rail and motor. The Scottish tour will include Ayr, Loch Lomond, Edinburgh and many other well-known and historic points. The party will then go through the eastern counties, stops being made at York, Leeds, Harrogate and some minor points. Continuing their journey, the party will cross to North Wales, visiting Chester and Manchester en route. On returning to England a stop will be made at Leamington and opportunity will be afforded to visit Stratford-on-Avon. From Leamington the party will go to Bristol, Exeter, Salisbury and Stonehenge. Arrangements include a visit to the fleet at Portsmouth if the fleet is in port, after which the party will travel to London. Ten days will be spent here before the party cross the channel for a tour of France.

Lloyd Memorial Seaside Home.

"Welcome Home" Concert.

A "Welcome Home" concert was held at the Lloyd Memorial (Caxton) Seaside Home, Deal, on the 3rd inst. to celebrate the return of Miss L. M. Gray and Miss I. Haste. Owing to illness Miss L. M. Gray was forced to retire some 10 months ago, but fortunately her health enabled her to take up duties again at the end of last month. In moving a vote of thanks to the "Promenade Pom-Poms," a first-class concert party who had given their services for the occasion, Miss Gray was greeted with such an enthusiastic reception that it was some time before she could proceed. In a voice full of emotion she thanked the 130 patients present for this wonderful testimony of the little she had been able to do for the sick ones who required convalescent care at their beloved home at Deal. It was a real pleasure to minister to the wants of those whose illness was such that special food and treatment demanded personal thought and consideration, because it set up a mutual bond of friendship between the patient and herself that made them life-long friends, which in itself was a reward that could not be estimated in language or coin of the realm. Not only would each patient continue to receive his or her proper dietary, but she would see that the more robust members had the best possible food provided them as well as a liberal and widely varied diet. Although sympathy with the sick and the needy was a most essential factor in dealing with the recovery of a patient's health, even that desideratum had to be backed up with good food. If, therefore, this policy had made her and the Home popular it was only right to say that the thanks were really due to the Committee who had insisted that neither time nor money should be spared to make their beloved home an ideal place to spend a happy and restful time during convalescence. In conclusion Miss Gray said she was deeply grateful for the kindness and consideration shown by the Committee and to the numerous expressions of sympathy sent her by those it had been her privilege to be associated with.

Her whistle can make a lot of noise, but it's her propeller that pushes a steamer forward.

Ink. By C. Ainsworth Mitchell, M.A. London, etc.: Sir Isaac Pitman and Sons, Ltd. Size 7 ins. by 4¾ ins. 128 p.p. Price 3s. net.

This further useful addition to Messrs. Pitman's "Common Commodities and Industries" series deals with the subject of inks and ink-making in a general and very readable fashion. As a manual for the works or the laboratory the author refers the reader to his own text-book "Inks and Their Manufacture," stating that it was his endeavour to make the present volume as free from technicalities as possible. He succeeds in rendering his subject both informative and interesting, and, with the aid of a goodly number of illustrations, gives the general reader an intelligible insight into the origin of inks and the methods of their manufacture. Printing inks can, of course, be dealt with only cursorily in a volume of this kind, but the author contrives to devote a 26-page chapter to their consideration, producing a most useful résumé. An interesting feature of this chapter is a full-page illustration showing special rotagravure ink mills at the factory of Messrs. B. Winstone and Sons, Ltd.

The Ventilation of Public Buildings.—By Robert Boyle. London: Robert Boyle and Son. Size 8 in. by 6 in. Price 6s. nett.

This compilation of data and opinions on problems of ventilation is of interest not only to those concerned with public buildings, such as churches, theatres and the like, but also to those who have to do with factories and offices. In the printing trade, where there is a large proportion of consumptive workers and where impure air is largely blamed for unhealthy conditions, the problem of providing efficient and healthy ventilation is of vital importance. This volume, published last week, bears striking evidence of the hygienic advantages of the "natural" method as contrasted with other methods of ventilation, viz., the method of ventilating by means of the natural motions of the atmosphere, these motions being utilised by the provision of suitable air inlets at a comparatively low level with suitable air outlets in the roof. Well printed and containing numerous line blocks illustrating ventilation systems, the book runs to over 50 pages, enclosed in a handsome paper boards cover. The printers are Messrs. Bemrose and Sons, Ltd.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

Switzerland.

The Acting British Consul at Basle reports that a local firm of manufacturers of photograph albums, filing cabinets, etc., are desirous of getting into touch with United Kingdom manufacturers of good quality black cardboard and Bristol board, white and coloured. Applications for further particulars regarding the inquiry should be addressed to the Department of Overseas Trade, 35, Old Queen-street, Westminster, S.W.1.

Spain.

The Acting British Consul at Bilbao reports that a local agent is desirous of obtaining the agency of United Kingdom manufacturers of typewriter ribbons, carbons and accessories, stationery and stationers' sundries and advertising novelties such as paper knives, pencils, ash trays, etc. For further particulars regarding this enquiry, application should be made to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1, quoting reference 8267/F.L./M.C.

Shareholders in rubber companies have recently been receiving specimens of writing paper containing latex in the form of pads. One who has received a dozen pads says they look well, are pleasant to write upon, and come out at the cheap rate of 2s. per block, which includes the address.

DIVIDENDS AND REPORTS.

BENN BROTHERS.—Net profit for year to June 30th, 1923, was £25,435, plus £11,068 brought in, making £36,503. Directors have placed to general reserve £10,000, and recommend dividend of 17½ per cent., less tax, carrying forward £10,133.

ABERDEEN NEWSPAPERS.—Directors announce interim dividend of 1s. per share, free of tax.

COLTHROP BOARD AND PAPER MILLS.—Profit £2,244 after providing £22,118 for depreciation, making available £6,128. Directors regret that profit is insufficient for dividend to be paid.

NORTHFLEET PAPER MILLS.—The holders of the existing debentures of Northfleet Paper Mills are invited to express their opinions on a proposal to exchange their holdings for a new issue of 7½ per cent. funding debenture stock. In the event of this being carried out £75,000 additional preference capital would be issued.

NEW COMPANIES.

J. C. ASTON, LTD.—Capital £5,000 in £1 shares; to acquire the business of a wholesale and retail newsagent and stationer, carried on by A. Aston, as J. C. Aston at 39 and 40, Smallbrook-street, Birmingham, and to carry on the same and the business of printers, lithographers, electrotypers, photographic printers, engravers, diesinkers, envelope manufacturers, bag and box makers, general carriers, railway and forwarding agents, etc. Private company. Directors: A. Aston, Mrs. K. H. Aston, and A. J. G. Aston. Registered office: 39 and 40, Smallbrook-street, Birmingham.

WALTER H. ROGERS AND CO., LTD.—Capital £1,000 in £1 shares; to acquire the business of wholesale paper merchants, carried on at 65 and 67, Neal-street, Shaftesbury-avenue, W.C.2, as "W. H. Rogers and Co.," and to carry on the business of paper merchants and dealers, stationers, printers, lithographers, paper bag and account book makers, box makers, cardboard manufacturers, etc. Private company. First directors: W. H. Rogers and E. C. Rogers. Registered office: 65 and 67, Neal-street, W.C.2.

THOMAS HALL AND CO., LTD.—Capital £7,000 in £1 shares; manufacturers and importers of and dealers in furniture, stationery and fancy goods, etc. Private company. Subscribers: J. C. Hall, G. Hall, T. Hall and H. Hall. Registered office: 41, South-road, Waterloo, Lancs.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

DARBY'S (PRINTERS), LTD. (Wimbledon).—Satisfaction in full on July 23rd, 1923, of debentures dated August 27th, 1921, securing £3,000.

A. COVERDALE AND CO., LTD. (printers, stationers, etc., London).—(A) First mortgage dated July 23rd, 1923, to secure £900, charged on freehold premises No. 21, Regent's-parade, Regent's Park-road, North Finchley. Holders: F. W. Maddocks, 10, Seagry-road, Wanstead; and R. C. Ratcliff, 2, Lancaster-road, Hampstead. (B) Mortgage of even date, to secure £300, charged on above property (subject to first mortgage). Holder: J. B. Smith, 15, Walbrook, E.C.

UDLOFF AND CO., LTD. (music engravers, printers, lithographers, etc., London).—Satisfaction to the extent of £500 on July 4th, 1923, of debenture dated January 4th, 1916, securing £1,000.

F. J. PARSONS, LTD. (newspaper proprietors, printers, etc., Hastings, and elsewhere).—Satisfaction in full (a) on June 30th, 1923, of debentures dated June 29th, 1921, securing £18,050; (b) on same date of mortgage or charge dated August 22nd, 1922, securing all moneys due or to become due, and (c) on July 17th, 1923, of transfer of mortgage dated December 4th, 1918, securing £4,950.

T. R. BECKETT, LTD. (newspaper proprietors, etc., Eastbourne).—Satisfaction to the extent of £1,000 on July 16th, 1923, of debentures dated January 18th, 1909, securing £7,000.

R. T. TANNER AND CO., LTD. (manufacturing stationers, etc., London).—Memorandum of deposit dated July 18th, 1923, charged on equity of redemption of leasehold premises No. 40-42, Primrose-hill, and 39 and 40, Hutton-street, E.C., to secure all moneys due or to become due from company to National Provincial and Union Bank of England, Ltd.

SOUTHERN EQUIPMENT AND SUPPLIES CO., LTD. (manufacturers of paper bags, boxes, stationery, etc., Brighton).—Debenture dated July 12th, 1923, to secure £150, charged on the company's property, present and future, including uncalled capital. Holders: Mrs. K. G. Theelke and T. A. Theelke, 20, Buckingham-place, Brighton.

PAVITT AND BARTLETT, LTD. (paper, twine, cord and packing material merchants, etc., London).—Particulars filed of £3,000 debentures authorised June 29th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £2,000.

Subsidiary of Warrillows.

Publishing Company's Affairs to be Investigated.

In the Birmingham County Court, recently, Judge Amphlett, K.C., made an order for the compulsory winding-up of the Art and Humour Publishing Co., Ltd., on the petition of J. T. Scrivens (trading as the Premier Engraving Co., 35 and 36, Hosier-lane), supported by creditors of the company.

Mr. Winning, who was for the petitioner, explained that Warrillows, Ltd., lithographers, stationers, etc., of Birmingham, claimed to be creditors for an alleged debt of £23,000.

The affidavit of the petitioner recited that the Art and Humour Co. had a capital of £5,000 and was established to carry on the business of manufacturers of and dealers in picture post cards, calendars, festive and fancy cards, and printed novelties. The company was indebted to the petitioner for £919 5s. 10d. It was promoted and formed by John Warrillow, Ltd., now known as Warrillows, Ltd. The registered office of the company was the same as that of Warrillows, although the company's business was carried on in London. A majority of its directors were directors of Warrillows, and of the 3,002 issued shares of the company 3,000 were held by Warrillows.

In March, 1923, a petition was presented to the High Court asking that Warrillows should be wound up. As a result the official receiver was appointed provisional liquidator and the petition adjourned for the purpose of enabling Warrillows to put forward a scheme of arrangement with the assistance of Sir Arthur Whinney, of the firm of Whinney, Smith and Whinney, chartered accountants, of London. On May 22nd, 1923, an extraordinary resolution for voluntary winding-up and for the appointment of Mr. F. T. Whinney, of the same firm as Sir Arthur Whinney, as liquidator, was purported to be passed by the Art and Humour Co. Six days previously Warrillows, in response to enquiries by a Mr. Maurice Spurgin (an important employee of the company) on behalf of a prospective purchaser of the company's business, wrote stating that the assets of the company were £48,137.

Searching Investigations Desirable.

On June 8th, 1923, a statutory meeting of the creditors of the company was held, presided over by Mr. F. T. Whinney as liquidator. At the meeting a statement of the company's assets and liabilities was submitted, showing the assets as being of the value of £5,830 only. Mr. Whinney was asked to explain the discrepancy, but said he was unable to do so. Thereupon a resolution was proposed that he should be replaced as liquidator by Mr. E. J. Palmer. All the creditors voted for the resolution, but Mr. F. T. Whinney stated he held a proxy for Warrillows as creditors for £23,000 which he was bound to use against the resolution, and it was lost. If the claim of Warrillows to be creditors of the company for £23,000 was valid and the assets of the company were only £5,830, the claims of the genuine trade creditors would be swamped by Warrillows.

In these circumstances a searching investigation into the transactions between Warrillows and the company, which had given rise to the alleged debt of £23,000, and into the apparent disappearance of assets of the company, was deemed to be desirable in the interests of the other creditors of the company. This, the petitioner contended, could not be effectively conducted in a voluntary liquidation by a liquidator nominated or appointed by Warrillows, and a brother and member of the same firm as the special manager of Warrillows, appointed in the proceedings for winding up that company, and engaged in formulating a scheme for saving Warrillows from having to go into liquidation.

The opposition to the granting of the order was that there was no reason for it. Warrillows were bona fide creditors, their claim for £23,000 representing a balance in their favour on certain transactions with the Art and Humour Publishing Co.

The Judge said the matter called for further investigation and he made a winding-up order.

Warrillows, Ltd.

A petition by J. S. Davey and Sons, Ltd., for the compulsory winding up of Warrillows, Ltd., was before Mr. Justice Lawrence in the Companies' Winding-up Court on July 31st.

Mr. Van Ek, for the petitioner, said this petition had stood over with a view to a scheme of arrangement. The company now said that the meetings would be held shortly and it was desired that the petition should stand over.

The petition accordingly stood over until next sittings.

Later Mr. Whinney, on behalf of the company, asked leave to bring a petition to sanction a scheme of arrangement during vacation if necessary.

His Lordship: You may make that application to the vacation judge.

PARTNERSHIPS DISSOLVED.

W. R. Pattinson and C. Yates, advertising contractors, at Prudential-buildings, St. Petersgate, Stockport, under the style of the Counties Advertising Co.

F. Congreve and T. N. Bradbury, advertising agents, at Sentinel House, Southampton-row, Bloomsbury, under the style of the Conbury Advertising Agency.

BANKRUPTCY ACT, 1914.

RECEIVING ORDER.

C. H. Hall, Constitutional Club House, Carr-lane, trading at High-street, Warsop, Nottinghamshire, printer, stationer and music dealer, lately general hardware dealer.

Wm. Tod, Jun. (1923), Ltd.

This company has been formed to acquire the business and assets of William Tod, Jun., and Co., Ltd., papermakers, Springfield Mill, Polton, Midlothian, and the Indurite Products Co., Ltd.

The plant installed consists of two complete papermaking machines and all necessary auxiliaries, and is modern and thoroughly efficient. The land on which the mill and employees' houses stand is owned by the company. During the years 1910 to 1914 new machinery was installed, at a cost of over £30,000, which very largely increased the manufacturing capacity of the mill, and at the same time materially reduced working costs. This new machinery had only run for one month when war broke out in 1914. As a consequence, the benefits which the new plant was designed to effect were only partially realised, the mill being continuously on short time from September, 1914 to September, 1922.

The Indurite Products Co., Ltd., has, after research extending over several years, perfected a process for the utilisation and conversion of paper mill waste material into a substance resembling vulcanite or ebonite, and for either of which it forms a highly satisfactory alternative. In its power to withstand the effects of heat it has been found far superior to most other insulating materials at present on the market. Indurite can be produced at a very low cost, and the plant for its manufacture is simple and inexpensive. The uses of indurite are numerous and varied, but it is the intention of this company to concentrate meantime on fittings and mouldings for the electrical industry.

The capital of the company is £190,000, divided into 120,000 7 per cent. cumulative convertible preference shares of £1 each and 70,000 ordinary shares of £1 each.

German Paper Industry.

The Commercial Secretary at Berlin (Mr. J. W. F. Thelwall) has forwarded to the Department of Overseas Trade a review, based on the reports of the Prussian Chambers of Commerce, of trade and industry during the month of June.

The month was noteworthy for a further extraordinary depreciation of the mark. On the one hand, this led to a strong revival of trade, with the result that an improvement occurred in many branches of industry, including paper. The machinery and chemical industries were also able to record better sales.

In the chemical industry the strong home demand was maintained owing to the heavy currency depreciation which occurred in the course of the month, and it was not always possible to carry out orders promptly. The raw material supply from abroad proceeded without interruption or difficulty.

With regard to the paper industry, owing to the depreciation of the mark, the prices of paper wood rose considerably. The small quantities still available on the inland market from the last fellings fetched prices two to three times higher than those in the previous month. Inland sales increased somewhat and foreign trade continued very brisk. Production equalled that in the preceding month. The labour supply was adequate. In the paper wholesale trade the demand continued satisfactory, and the factories were again better employed.

German Pulp and Paper Market.

Difficulties of Trading—Disputes as to Settlement of Accounts — Wages Stabilisation — Contract Pulp Quotations Unchanged—Consumption of Sulphite Exceeds Supply—Orders Placed in Sweden—Mechanical Market Satisfactory—Coal, Rail and Postage Rates Higher—Paper Production Costs Up—Prices Still Ascending — News-Print Deliveries Affected by Price Fixing—Attitude of Publishers—Paper Machine Installation.

(From Our Own Correspondent.)

In general, things are unchanged as regards ordering and development in the home price level. The exchange value of the mark is not able to prevent the coming ruin of the German mark value. Disputes between producer and wholesale and retail dealer concerning terms of payment and valuation of accounts paid too late are now the order of the day. Retail dealers claim gold prices, but existing legislation hinders this tendency.

Workpeople have reached in isolated cases wages of steady value. Yet prices of the necessaries of life to-day are higher by 278 per cent. than the average prices in June.

Quotations of chemical and mechanical wood pulp are unchanged where buyers have prepaid the necessary amounts for contract deliveries. Other sales are based upon the dollar level, which is higher from day to day in spite of the efforts of the Government to retard the fluctuation. The home demand for chemical wood pulp is brisk, and is not entirely satisfied. Orders for sulphite have been placed in Sweden by German paper mills having the advantage of low rates of shipping. Coal troubles, however, do not permit the pulp mills to run to capacity. Production and sales of mechanical pulp are satisfactory.

Coal prices were raised last time by 50 per cent. and by a further 63 per cent. since July 17th. Railroad rates will be raised by 150 per cent. for goods and 200 to 300 for passenger traffic. Postage will also be higher by more than 200 per cent. from August 1st. All costs of production will be higher considerably in consequence.

The joint Papermakers' Associations were not able to maintain their prices of July 1st and quotations for all papers were raised by 35 per cent. from July 16th. Further increases from July 23rd are expected. Present prices are: Printing and writing papers, containing M.W.P., 12,500 to 31,000; pure writings, 25,500 to 42,000; and pure printings 23,000 to 39,000 marks per kg. Quotations are more than 50,000 times higher than pre-war.

The Government has decreed compulsory prices for news print from July 15th. The consequence will be decreased quantities delivered by news-print mills, which are not willing or able to sell below producing costs. Publishers apparently trust that they will be able to bring pressure upon the mills by raising difficulties and objections to the export of news print and paper in general.

Exports of pulp from Germany in April were 7,786 metric tons and in May 12,366, the monthly average in 1922 being 6,189. Compared with a monthly average last year of 34,788 metric tons of paper and paper wares exported, the figures for April last was 46,398.

A new paper machine will be installed next spring at Odermünde, for the main paper mill of the Feldmühle A.G., Stettin. It will produce 100 to 120 metric tons per 24 hours. The trimmed web of paper to be delivered continuously at the rate of 300 to 350 metres per minute is 5.5 metres wide (216 inches). The machine will be up-to-date in every detail. The wire is 5,900 mm. wide and 25m. long (82 feet). There are three wet presses, 36 dryer rolls (1,800 mm. in diameter) and 12 felt dryers (1,500 mm. in diameter). The calender has 12 chilled iron rolls. The machine will be driven by a sectional electric drive.

Messrs. Suckling & Co.

The Market for Vegetable Parchment.

Dealing in a wide range of papers, Messrs. Suckling and Co., papermakers' agents and merchants, Royal London House, Finsbury-square, London, possess an excellent organisation for handling orders, which are the more easily attended to by reason of the fact that the firm have branches both in London and Manchester. There is the further advantage that Mr. E. J. Suckling himself directs the whole concern with energy and knowledge born of experience.

Over a period of many years Messrs. Suckling have built up a good connection, and it is gratifying to know that the business is constantly extending. Specialties are a feature of modern commerce, and the lines most prominent at Royal London House are pure vegetable parchment, glazed "news," S.C. printings and sulphite wrappings.

Just now there is a steady demand for vegetable parchments, due in some degree to the extending practice of protecting foodstuffs, but also to the fact that supplies are short of requirements. German supplies are not up to expectations. Fortunately Messrs. Suckling, who have the advantage of being manufacturers' selling agents, are concerned only with Belgian brands, for which there is a growing call.

Not only is the demand for vegetable parchment emphasised in ordinary directions, but special uses have been developed of late, and Messrs. Suckling, as specialists, are exceptionally placed for providing what is required at attractive prices.

In addition to pure vegetable parchment for a variety of purposes, the firm have also a wide experience of imitation parchments and greaseproofs, while, as already mentioned, their wrapping paper and printings are features of an extensive business.

Swedish Paper Exports.

Growing Demand in U.S.A.

The firm of C. K. MacAlpine and Co., 1855, Hudson Terminal, New York, hold a prominent position as importers of Swedish paper. They are the representatives of a number of important Swedish mills, whose production finds increasing favour in the American market.

Mr. C. K. MacAlpine has been on a visit to Sweden during recent weeks, and also spent some days in London prior to returning home.

The Jubilee Exhibition at Gothenburg naturally attracted his close attention, and he found much of an interesting and instructive nature, typical of the great industrial progress and expansion of the country.

"Full justice," said Mr. MacAlpine, "does not, however, appear to be done to the importance of Sweden's pulp and paper industry. One gets an excellent idea, but the exhibits are collective rather than those of individual mills."

Mr. MacAlpine during his visit took part in a conference of the trade interested in the prospects of the American market, and his intimate knowledge of the prevailing conditions afforded valuable help in the discussion.

It appears that excellent shipments of Swedish paper are being made to the States. "News" is not handled by Mr. MacAlpine's firm, whose attention is chiefly given to No. 1 Swedish kraft, and also to printings.

"A good market is likely to continue in the United States, owing to improved conditions," is the view of Mr. MacAlpine, who whilst on the continent, visited the mills of Messrs. Van Gelder, of Amsterdam, which firm they represent in the States.

Papeteries Outhenin-Chalandre, with paper mills at Geneuille, Chevroz, Deluz (Doubs) and Savoyeux (Haute Saône) is increasing the capital from 3,000,000 to 6,000,000.

Basis Weights Conversion.

By WILLY GRUNEWALD.

With the great variety of sizes of American and English papers it is rather difficult to convert the so-called basis-weights into weights per square metre. The following formulæ and tables will greatly facilitate the conversion of any required size, number of sheets, reams, or weights. The following formula will apply generally to all conversions of this description :—

$$x = \frac{P}{a \times b \times R} \times 703900$$

wherein x represent grams per sq. m.,
P ,, weight in lbs.,
a ,, length of sheet in inches.
b ,, width of sheet in inches.
R ,, number of sheets pr. ream.

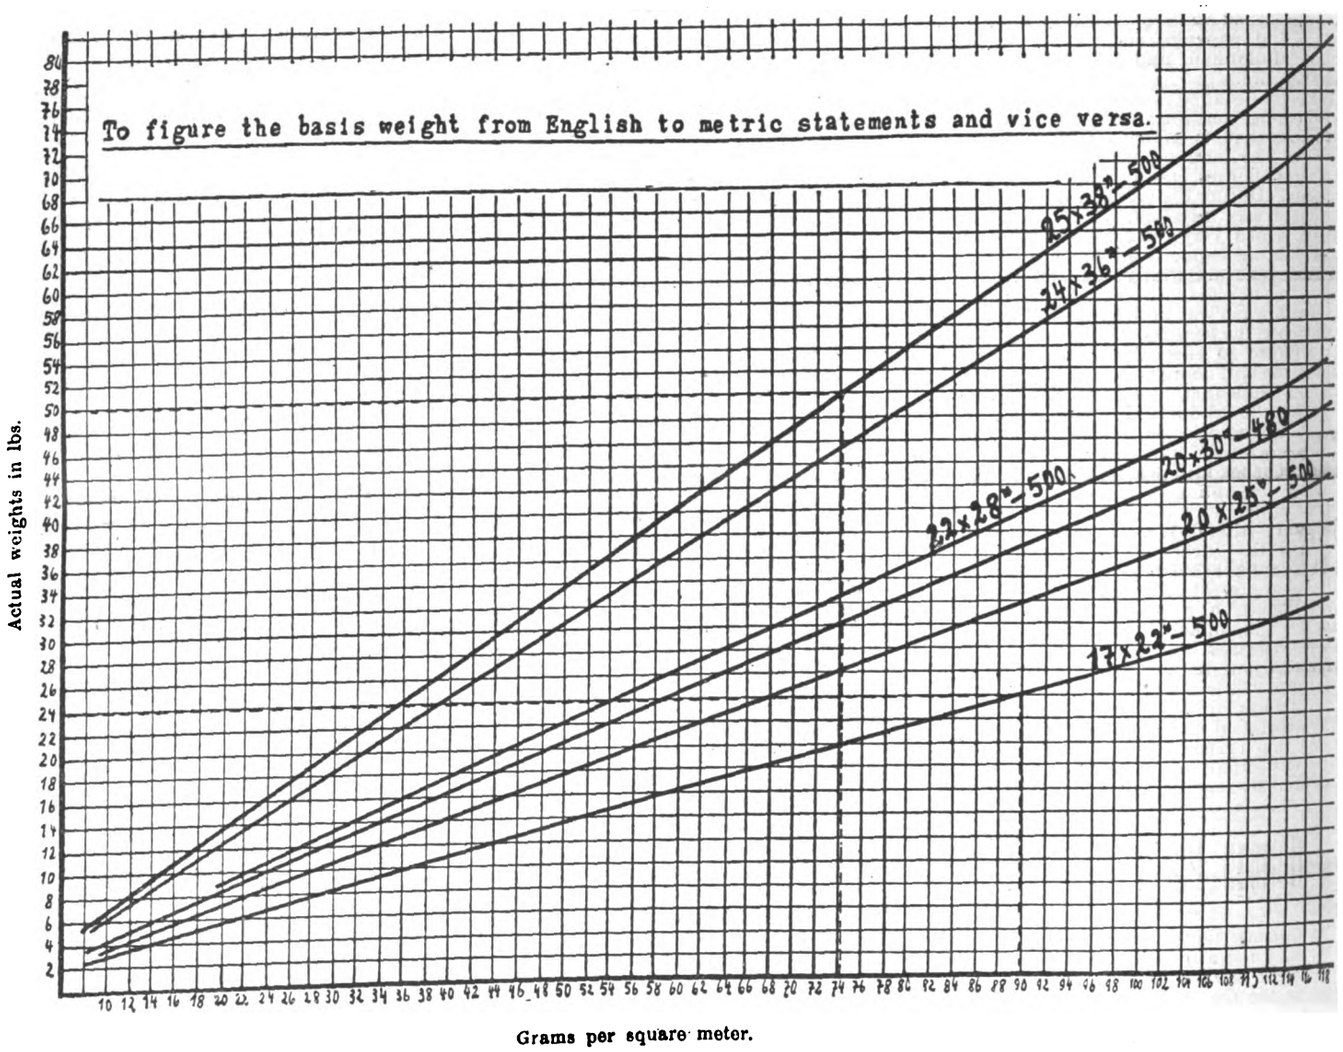
If in this formula the size of sheet is inserted with 17 by 22 in. and the number of sheets with 500, the formula may be simplified to

$$x = \frac{P}{17 \times 22 \times 500} \times 703900 = P \times 3{,}764$$

i.e., any weight given in lbs. for size 17 by 22 in. and 500 sheets has only to be multiplied with 3.764 in order to obtain the weight per sq. m.

In the same manner all the usual sizes of sheets may be converted by using the figures given in the following schedule.

Size of sheets inches.	Size in cms.	Co-efficient of conversion for 480 sheets.	500 sheets
17 by 22[1]	43,18 by 55,88	3,920	3,764
20 ,, 25[2]	50,80 ,, 63,50	2,928	2,812
20 ,, 30[3]	50,80 ,, 76,20	2,440	2,343
22 ,, 28[4]	55,88 ,, 71,12	2,378	2,282
24 ,, 36[5]	60,96 ,, 91,44	1,695	1,627
25 ,, 38	63,50 ,, 96,52	1,541	1,498



[1] Writing bond, [2] wrapping paper, [3] tissue paper, [4] cards, wrapping paper, [5] news-print, packing paper, [6] book print, news-print.

If it is desired to find the basis-weight in lbs. from the weight per sq. m. one has only to divide the weight per sq. m. by the co-efficient of conversion given above.

For daily routine work the conversion is simplified still further, if the conversion ratios for the various sizes are represented graphically. This will result in the diagram shown below.

From these diagrams of the various sizes of sheets it is possible to read off for every basis-weight the corresponding weight per sq. m. in a very simple manner. For instance if an order should be received for 500 sheets 25 by 38 in., 50 lbs., one starts from the weight-indication 50 on the left side of the table, and follows along the horizontal line until it cuts the line marked 25 by 38 in.—500; from the point of intersection of the two lines one goes vertically downward (see the dotted line) until meeting the last horizontal line bearing the weights per sq. m. In the instance given the weight per sq. m. will be slightly above 74 or roughly 74 g/sq. m.

Should on the other hand a weight of 90 g/sq. m. be given for paper of 17 by 22 in.—500 sheets, and the weight in lbs. to be found, one starts from the weight "90" on the lowest horizontal line of the table, and plots vertically upward (see the dotted line) till it cuts the line 17 by 22 in.—500, and thence horizontally to the left until one meets the number 24 as the value for the weight in lbs.

Hamburg Paper Fair.

The Fourth Hamburg Paper Fair, organised by the paper merchants and stationers of Hamburg, is reported to have attracted a very satisfactory number of exhibitors, there being some 550 stands showing the goods of about 200 exhibitors. Of the exhibitors, about half are firms having representatives in Hamburg and about half hail from other parts of Germany. The value of local fairs appears to be much enhanced now that the economic situation renders it impossible for many smaller houses to be represented at the big national exhibitions.

Austro-Italian Treaty.

Customs Modifications Affecting Pulp and Boards.

A Treaty of Commerce and Navigation between Italy and Austria was signed on April 28th, and was to come into force eight days after the exchange of ratifications. It is concluded for one year, and is subject to six months' notice of denunciation.

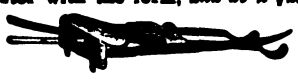
A number of pulp and paper items are affected by the modifications in the Customs Tariff. The reduced Italian import duties resulting from the Treaty will be applicable to similar goods produced in the United Kingdom.

Packing paper, not white or dyed, made of mechanical wood pulp, steam dried, of natural brown colour, even if glazed on both sides, weighing 40 grammes or more, but less than 300 grammes, per square metre, was dutiable under the Tariff of July 1st to the extent of 5.00 gold lire per 100 kilogs. The co-efficient of increase fixed by the Tariff (or subsequent treaties) was 0.5, and as fixed by the present treaty 0.2. The same rates apply to leather board, not coloured or glazed.

Ordinary pasteboard "dyed in the pulp, not glazed," was subject to a duty of 6.00 gold lire per 100 klogs. under the July 1st, 1921, Tariff, and the co-efficient as fixed by the Tariff (or subsequent Treaties), is 0.5

Fine pasteboard, bleached or dyed in the pulp, not coated, had a duty of 20.00 gold lire and the co-efficient fixed by the Tariff (or subsequent Treaties) is 0.5.

A note explains that pasteboard formed from one layer or more than one layer joined by pressure without the aid of glue is considered as "ordinary" cardboard. All other pasteboard formed from layers of paper stuck together, or covered with paper, is classed as "fine" pasteboard.



Manufactures of pasteboard and paper, not specially mentioned, other (*i.e.*, other than those with ornamentations), were dutiable at 70.00 gold lire under the 1921 Tariff, with a co-efficient of increase of 0.5.

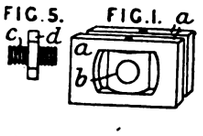
New Inventions

Printers' Extensible Furniture.

Printers' extensible furniture, which can be used to form a stereotype mounting-board, as patented by Messrs. C. C. Whitling and W. A. Gitsham, consists of two relatively sliding members A, B of wood, aluminium, brass, &c., one member B being T-shaped, and the other having a vertical slot in which the stem of the T-shaped member slides. The members are maintained at the desired extension by the insertion of packing material, such as

FIG.2. FIG.3.



quads, quotations, &c., between the head of the T-shaped member and the end of the member A. A scale on the member B shows the length of packing required. In a modification, two L-shaped members are used. The devices may be used to build up a mounting-board for stereotype plates, as shown in Fig. 3.

A Locking-Up Device.

This invention, patented by Mr. C. E. Goddard, referring to a locking-device for use in connection with printing machines, chases, formes, &c., and in other machines where a fine adjustment is required, comprises two slotted plates a, Fig. 1, in each of which is pivoted a semi-cylindrical nut b, the nuts being engaged by a right-and-left-handed screw c, Fig. 5, having an

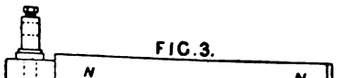
FIG.5. FIG.1. a

hexagonal collar d, by means of which it can be rotated. The swivel action in both plates enables the block, type, &c., to be adjusted without removal of the locking-devices. The Provisional Specification describes also an arrangement in which one plate is directly engaged by the screw.

Paper Bag Machines.

According to an invention, patented by Mr. R. Rolland, in machines for making paper bags of the block bottom type, the adoining

FIG.3.



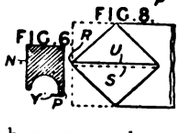


FIG.6. FIG.8.

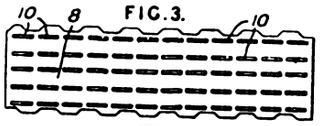
bottom edges of the bag are made to overlap by a horizontally reciprocating block having depending parts of unequal depth and length which comes into operation immediately after the diamond fold has been formed in known manner. The longer part P of the block N first comes into contact with the front triangular part R of the bag and presses the edge S flat on to the former plate thus ensuring that the edge U overlaps it. An inwardly projecting part Y may be attached to the part P.

Plates for Stamping Up.

To ensure uniform thickness in a series of printing plates of the kind in which the printing characters are stamped up from a sheet of metal or other material, irrespective of irregularities in the thickness of the sheet from which the plates are made, the plate blanks are formed with projections on one face, and are afterwards subjected to a reducing or levelling process to bring the combined thickness of the projections and the body of the blank to a standard thickness. The blank 8 is stamped with

10 8 FIG.3. 10



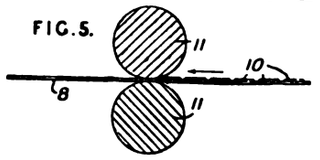


FIG.5.

rows of narrow projections 10 and is then passed between a pair of pressing rollers 11 which reduces the combined thickness of the plate 8 and the projections 10 to a predetermined standard. The printing characters are afterwards stamped up in the usual manner between the rows of projections but on the opposite side of the blank. The invention is by Addressograph, Limited.

Typecasting Machines.

Messrs. F. Reed and G. H. Davis have patented an invention that relates to (1) pump-stop mechanism to prevent splashing of the metal in case the mould does not close properly and (2) adjustable pump-wells (1) The piston-lever 1 of the pump is pivoted to the side of a standard 2, which guides the pump-rod, or to a bearing at the side of the metal pot. The pump-rod 7 is guided in a box-head 6, which is large enough to permit

FIG.1.

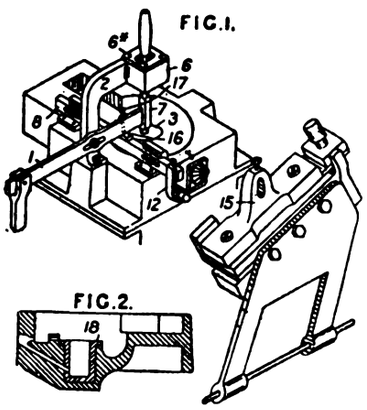

FIG.2.

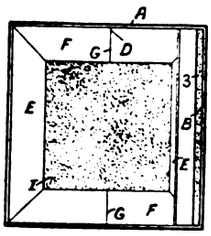


withdrawal of the pump 3 after the cover 6* has been removed. The lever 1 has a slotted engagement with its pivot to enable it to be withdrawn from engagement with the pump-rod. The pump is adapted to be locked by a sliding bar 8 having a projection 16, which is normally clear of, but can be moved beneath, a screw 17 on the pump-lever 1. The bar 8 carries an adjustable member 12, which is engaged by a projection on the top mould-block 15, when the mould fails to close properly. (2) The metal pot has an interchangeable smooth-surfaced flanged well, 18, Fig. 2.

Cleaning Type.

Mr. E. Thollmann has invented a plastic composition for cleaning the type of printing machines which preferably comprises 60-70 parts by weight of a mixture of "Plastilina" (particularly a preparation of clay and glycerin) colophony, and petroleum, 30-40 parts of ground para rubber, and some talc. Glycerin and a solution of resin is then added and the composition is mashed under heat, rolled by hot rollers, and cut into plugs.

Collapsible Boxes.

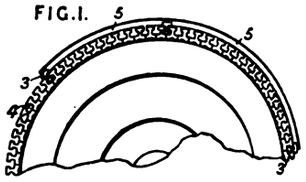
In an invention by the E. & A. Gunther Company, Limited, a collapsible box of the kind having a flexible bottom and two opposite sides A jointed vertically at D to allow them to collapse inwardly, is provided with flexible flanges E, F on the four

sides, lying above and supported by the flexible bottom I. A movable rigid bottom 3, which may be hinged at the lower edge of one of the sides B, serves to distend the box and to hold it in its erected position. The flanges F are divided at G.

Printers' Rules.

In an invention by Mr. C. F. Green, curved rules 5, Fig. 1, for printing vertical lines in rotary type duplicating and like machines are held in slots in blocks 3 which fit in the type-channels 4 of the forme or

FIG.1. 5



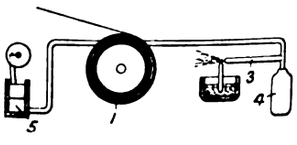


FIG.4.

printing-cylinder. The forward end of the rule may have a hook or projection 7, Fig. 4, adapted to engage in a type-channel, so as to prevent detachment of the rule.

Electricity in Paper.

A patent application has been made by Mr. C. W. Hartmann concerning a device for getting rid of electricity in paper. Accordingly, electricity is discharged from a paper web in a paper bag-making or similar machine by moistening the paper by directing against it particles of water or other moisten-

ing agent carried in a finely divided and uniformly distributed state by means of a gaseous medium which moves against the paper. This may be effected by an atomising device 3 in which air, compressed by a pump 5 driven by the machine, passes from a storage bottle 4 so as to direct a moistening mist on to the roll of paper 1.

THE best salesman is the man who not only makes sales but makes salesmen of his customers.

British Paper Industry.

Reflections on Present Market Conditions.

Business in British paper moves along very slowly, and there appears little prospect of recovery during the summer. This influence is being felt over a wide area, and both Europe and America are suffering the effects.

Where British mills might have secured some advantage from such demand as exists, this appears to have gone over to the Germans.

News-print is the one bright exception in a poor outlook, and here, according to a writer in *The Times* (Trade Supplement), quality and reliability are the factors that are keeping our news-print mills well employed. It is argued that the present cost of mechanical wood pulp would justify an advance in the price of news-print, but with a number of competitors, owing to the depreciation of their currencies, able to quote ridiculously low prices, it would be suicidal on the part of the news print mills to attempt to raise quotations.

German Competition.

In regard to wrapping papers, the writer points out that in this section of the industry conditions are much more difficult and infinitely more serious. Here we have English mills compelled to close down and others working only part time owing to the flooding of the market with cheap foreign paper. "So long as competition was restricted to Canada and Scandinavia the field was fair. Within recent months Germany has unloaded thousands of tons of wrapping paper for which she has no sale in her own country. The material does not always come direct from Germany, because, owing to the fallen value of the mark, it is a profitable proposition for neighbouring countries to secure supplies of paper for re-sale. The type of paper referred to is chiefly that known as kraft, but much the same thing is happening in the case of greaseproof wrappings and bank papers. It may be observed that the rapid decline in the value of the mark makes it necessary for German papermakers to look abroad for markets. Internally paper is too dear for normal consumption; externally it is so cheap that buyers can be found anywhere. German kraft wrapping papers fall far below the English standard.

"The home mills have developed kraft paper manufacture to a pitch of excellence only slightly below the best Swedish practice and well in advance of most of the second-rate grades imported from Scandinavia. In pre-war days the German mills made a very good kraft, but the product they are now exporting at such low prices is merely an imitation kraft produced from sulphite instead of sulphate pulp.

"German competition is also being severely felt by the manufacturers of super-calendered papers. Higher priced wood pulp and increased costs of coal have forced our mills to advance their prices a fraction. This provides an opening for low grade German S.C. printing paper at the old price. In the better class qualities the English and Scottish mills can easily hold their own. Fortunately for the British papermaking industry, supplies from the foreign mills are unreliable in regard to quality and delivery. The German mills are limited as to output, and their engagements run far ahead."

After sounding a more encouraging note with reference to esparto papers, we are told that among the fine paper mills there has been a slight decline in bookings. Compared with a year ago trade is infinitely better and the machines are more fully employed. Colonial requirements are providing good employment for manufacturers of tub-sized papers, and the foreign demand is increasing gradually. Shippers and Eastern traders are passing through a very difficult period, and their requirements in stationery are almost negligible. According to well informed opinion, there is a gradual reversion in favour of high-class papers in circles where lower standards had temporarily been adopted.

Inquiry among the hand-made mills reveals a very satisfactory state of affairs, considering the general condition of trade.

Paper Standardisation.

Progress of the Movement.

The paper standardisation question, which has been studied by the Paper Laboratory of the Bureau of Standards for the past two years, culminated in a general conference at the Bureau, attended by some 75 paper manufacturers, paper merchants, and representatives of the printing industry, as well as Government experts.

As a result of the conference, resolutions were passed adopting the final reports submitted by the various committees and sub-committee, which have already appeared in the *British and Colonial Printer*. It is proposed to hold a similar conference at the Bureau at least once a year, at which time the existing standards will be revised and brought up to-date.

Mr. Wm. A. Durgin, chief of the Simplified Practice Division of the Department of Commerce, described the work done in other industries in the elimination of waste. He pointed out that the only interest of his division was to eliminate the unnecessary but not in any way to curtail variety to such an extent that individual initiative would be hampered.

Dr. George K. Burgess, the new director of the Bureau of Standards, explained briefly the position of the bureau with regard to the question of standardisation and simplification. He pointed out that the bureau was not in the position of demanding or forcing standardisation or simplification in the industry, but was simply in the position of advising with industries with a view to enabling them to adopt anything having to do with elimination of waste.

U.S. Paper Production.

Comparative Figures During Last Six Years.

A recent report to the Federal Trade Commission, U.S.A., upon that country's paper production gives the production figure for the month of May in the years 1918-19-20-21-22-23. These figures generally show an advance in the more recent years, although in nearly every case a drop occurs in the year 1921. The totals in net tons for the years in question are as follows, the more recent figures being given first: 659,025, 589,971, 383,995, 645,413, 480,171, 538,416. The average production during these years was 542,958 tons net.

The production in net tons under separate headings for the years 1923 and 1922 are given below, together with the average figure for the six years. An advance will be observed in each case excepting bag paper:—

News print (standard and special grades of news): 1923, 138,868; 1922, 129,950; average, 115,908.

Standard news (included in news-print) 1923, 126,215; 1922, 120,654; average, 105 456.

Book (M.F., S.C. and Coated): 1923 97,221; 1922, 82,574; average, 77,7t6.

Paperboard—total (straw, fibre, leather, chip, box, etc.): 1923, 199,939; 1922, 176,790; average, 170,118.

Boxboard (included in paperboard): 1923, 135,185; 1922, 130,078; average (for 1920-23 only), 122,096.

Wrapping (kraft, manila, fibre, etc.): 1923, 85,348; 1922, 71,494; average, 63,362.

Bag (all kinds): 1923, 10,581; 1922, 17,345; average, 15,418.

Fine (writing, bonds, ledgers, etc.): 1923, 35,196; 1922, 30,129; average, 28,964.

Tissue (toilet, crepe, fruit wrappers, etc.): 1923, 16,589; 1922, 14,688; average, 13,962.

Miscellaneous Grades (specialties not otherwise classified): 1923, 28,705; 1922, 25,196; average, 22,230.

U.S. News-Print.

Statistics furnished by the Federal Trade Commission, Washington, show that the average production of total news-print and standard news, based upon the total combined production for the years 1918 to 1922, inclusive, amounted to 115,908 tons for total news-print, and 105,456 tons for standard news for a period corresponding to May. The actual production for May, 1923, amounted to 138,868 tons of total news-print and 126,215 tons of standard news, which was 20 per cent. above the average for the five-year period for both news-print and standard news.

The production of news-print for May, 1923, compared with May, 1922, shows an increase of 7 per cent. for total news-print and 5 per cent. for standard news. The production for May, 1923, compared with May, 1921, shows an increase of 76 per cent. for total news-print, and 72 per cent. for standard news.

Average Prices Paid by Publishers.

The weighted average price of contract deliveries from domestic mills to publishers during May, 1923, f.o.b. mill, in car load lots, for standard news in rolls was $3.726 per 100 pounds. This weighted average is based upon May deliveries of about 84,000 tons on contracts involving a total tonnage of approximately 602,000 tons of undelivered paper manufactured in the United States.

The weighted average contract prices based on deliveries from Canadian mills of about 63,000 tons of standard roll news in car load lots, f.o.b. mill, in May, 1922, was $3.777 per 100 pounds. This weighted average is based upon the May deliveries on contracts involving about 186,000 tons of undelivered Canadian paper.

The weighted average market price for May, 1923, of standard roll news in car load lots f.o.b. mill, based upon domestic purchases totalling about 11,000 tons, was $3.957 per 100 pounds.

New Zealand Paper Imports.

Figures relating to paper and stationery imports into New Zealand show that of the countries sending these goods the United Kingdom did best with £122,918 in the December quarter, 1922, against £74,429 in the same quarter of 1921. Canada followed with £92,703 against £59,148, the United States with £8,617, against £1,623, and Australia with £3,519, against £7,287.

Papermakers' Technical Library.

The library of technical books which is being assembled at the offices of the Papermakers' Association now forms a substantial and representative collection. It has been decided that the books shall be available for the use of members under the following conditions: (1) The library will be open for the use of members at the Association offices during the hours of ten to five, except on Saturdays, when it will close at 1 p.m. (2) Books will be sent to members by post on condition that the postage is paid both ways and the book is not kept longer than a fortnight. These rules also apply to the volumes presented to the Association by Mr. Lewis Evans, but Rule 2 will not apply to certain rare and valuable editions.

Recent additions to the library made by the Technical Section include the following:—

Title of Book.	Author.
Alternating Current Work	W. Perren Maycock.
Applied Colloid Chemistry	W. D. Bancroft.
Bleaching and Dyeing of Vegetable Fibrous Materials	J. Hubner.
Callendar Steam Tables, The	H. L. Callendar.
Calorific Values of Fuels	H. Poole.
Chapters on Papermaking, Vols. I., II., V.	Clayton Beadle.
Chemistry and Colloids	W. W. Taylor.
Chemistry of Pulp and Papermaking	E. Sutermeister.
Cotton and Other Vegetable Fibres	E. Goulding.
Critical Microscopy	A. C. Coles.
Deinhardt-Schlomann Series of Technical Dictionaries in Six Languages:	
Vol. I. The Elements of Machinery and the Tools most frequently used in Working Metal and Wood.	
Vol. II. Electrical Engineering, including Telegraphy and Telephony.	
Vol. III. Steam Boilers and Steam Engines.	
Vol. VII. Hoisting and Conveying Machinery.	
Vol. VIII. Reinforced Concrete in Sub- and Superstructure.	
Vol. XIII. Structural Engineering.	
Dictionary of Applied Chemistry, 4 vols.	Sir Edward Thorpe.
Dictionary of Applied Physics, 5 vols.	Sir Richard Glazebrook.
Electrical Engineering	Dr. E. Rosenberg.
Forest Products of British West Africa	G. C. Dudgeon.
Foundations of Alternate Current Theory	C. V. Drysdale.
Fuel, Water and Gas Analysis	J. B. C. Kershaw.
Handbook of Colloid Chemistry	Dr. Wolfgang Ostwold.
Industry and Trade	A. Marshall.
Introduction to the Study of Physical Metallurgy, An	W. Rosenhain.
Manual of Paper Technology	R. W. Sindall.
Manufacture of Paper, The	R. W. Sindall.
Mechanics Applied to Engineering	J Goodman.
Modern Microscopy	M. I. Cross and M. J. Cole.
Modern Pumping and Hydraulic Machinery	E. Butler.
Organic Chemistry, Vols. II., III.	Cohen.
Paper and its Constituents	H. A. Bromley.
Papermaking	C. F. Cross and E. J. Bevan.
Paper Mill Chemist, The	H. P. Stevens.
Physical and Chemical Constants and Some Mathematical Functions	G. W. C. Kaye and T. H. Laby.
Physics, 4 vols.	Poynting and Sir J. J. Thomson.
Pocket Book for Mechanical Engineers	D. A. Low.
Practical Papermaking	G. Clapperton.
Practical Physical Chemistry	Findlay.
Reinforced Concrete Construction, Vols. I., II, III.	G. A. Hool.
Researches on Cellulose, Vols. I. II., III., IV.	C. F. Cross.
Steam and Other Heat Engines	Sir J. Alfred Ewing.
Steam Turbines	W. J. Goudie.
Structural Engineering	J. Husband and W. Harby.
Text Book of Heat Engines, A.	Prof. Jamieson and E. S. Andrews.
Textbook of Mechanical Engineering	W. J. Lineham.
Textile Fibres	Matthews.
Timber and Paper Materials	Report of Imperial Institute.
Treatment of Paper for Special Purposes	L. B. Andes.
Valves and Valve Gear Mechanism	W. E. Dalby.
Water Softening and Treatment	W. H. Booth.
Wood Pulp and Its Uses	C. F. Cross, E. J. Bevan and R. W. Sindall.
More recent additions are: —	
Cellulose	C. F. Cross.
Das Faerben des Papierstoffs	Erfurt.
Das Papier, Vol. IV.	Kirschner.
Das Trocknen mit Luft und Dampf	Hausbrand.
Dictionary of Physics, Vols IV,, V.	Sir Richard Glazebrook.
Die Chemische Untersuchung Pflanglicher Rohstoffe	Schwalbe.
Die Praxis der Papierfabrikation	Schubert.
Engineering Year Book	Kempe.
H.M. Patent Office. Patent Abridgment Class 96 from commencement	
Hydraulics	Lea.
Mikroskopie der Technische verwendeten Faserstoffe	Hoehnel.
Organic Chemistry, Vol. I.	Cohen.
Papier Pruefung (1921)	Herzberg.
Pflengen-Stoff, Vols. I. and II.	Wissner.
Practical Alternating Current Power Transmission	Harrison.
Praxis der Pappenvarerbeitung	Hess.

LOVE'S PAPER RECOVERY MACHINE.

Patented (No. 144485) by Joseph Love.

THIS Machine has been invented for the purpose of speedily recovering the small quantities of paper left on centres or spools which are thrown out from Printing Machines, etc. (commonly known as "Reel Ends"), so that it may be cut into suitable sizes by the Guillotine.

CHIEF ADVANTAGES:

1.—No spindles, bars, or cones are required, the reels being kept in position by a patent spring device thus saving time and labour in loading and unloading.
2.—It occupies a space of only six feet on the run, and is quite noiseless.
3.—The power required is such a small amount that it can be driven from any existing shafting.
4.—Centres of any kind or width can be worked on the machine.
5.—It can be run at the high speed of 500 feet per minute, and will recover approximately 3 tons of paper per day.
6.—It can be constructed to suit all requirements in the off-cut trade, and is equally valuable to Printers or in Paper Mills.

The Elimination of Make-Ready.

A First-Hand Account of an Important Movement towards Precision in Printing.

It goes without saying that make-ready is a sop thrown to appease the devil of inaccuracy: it is a means of compensating for errors in printing surfaces and printing machinery—inequalities of heights of types and blocks, unevenness in plates and lack of truth in the surfaces and motions of printing presses. At what a cost does the printer indulge in these inaccuracies! The latest standard hourly rates of the Federation of Master Printers indicate that the time spent on make-ready ranges from one to 22 hours for sheets of sizes from demy folio 4 pp. up to quad demy 16 pp. For jobs of these sizes, one to six hours are reckoned to be the average time for make-ready on ordinary letterpress matter; 1½ to 12 hours on matter containing one half-tone block to each 4 pp.; and 3½ to 22 hours on matter which includes a block on each page. When these numbers of hours are multiplied by the number of shillings per hour which the work costs, and then multiplied by the number of jobs done in the year, some idea will be obtained of the size of the annual make-ready bill which the printer has to foot.

Important Field for Inquiry.

The possibility of obviating the inaccuracies which give rise to make-ready is one of the big questions of the day, and it offers the most promising direction in which letterpress printing can strengthen its defences against the inroads now being made by such methods as photo-offset and photogravure. In this connection a name which is becoming increasing familiar is that of Mr. Lex Claybourn, who recently established the Claybourn Process Corporation in Milwaukee, U.S.A. Previously he was for some years general manager of the Menasha Printing and Carton Co., and wild claims were made for a process which he has been developing for the past fifteen years. This was perfected some two or three years ago, and has been undergoing practical tests for some time. The outstanding high spot of these claims was that Claybourn was printing without recourse to to make-ready and securing better printing. Thorough inquiry into Mr. Claybourn's work was made recently by Mr J. E. Gilbert, of the Gilbert-Harris Overlay Co., and special interest attaches to his first-hand account, contributed to the *Ben Franklin Monthly*, from which we extract the following:—

After spending several hours in the Claybourn plant I had to admit that everything I had heard of the Claybourn Process was not only true, but that the simplicity and the results secured are beyond belief. The Claybourn Process, Claybourn machinery and equipment are nothing more nor less than plain common sense, with all the inequalities and frailties of guesswork removed. In their place stand sound reasoning and fact. Claybourn does print without make-ready, and he prints in quality that has never been surpassed. After viewing the results of his work, I felt, as never before, that letterpress printing, especially process colour work, is creeping into a new vista of beauty and utility. I never before had had the fortune to inspect such wonderful printing. It all seems more like a dream. And they talk about opportunity petering out! Unless I miss my guess, opportunity in the printing business is just starting to show.

So thoroughly has the Claybourn process been developed and perfected that no one feature of the progress of work, from the artist to the completed product, has been overlooked. Claybourn began a good many years ago, when yet a boy, to ferret out and correct the inequalities and pitfalls of printing. He went every bit of the distance through the graphic arts industry and delved deeply into mechanics of many lines in an effort to get at the bottom. That's where he started in his quest of perfect printing.

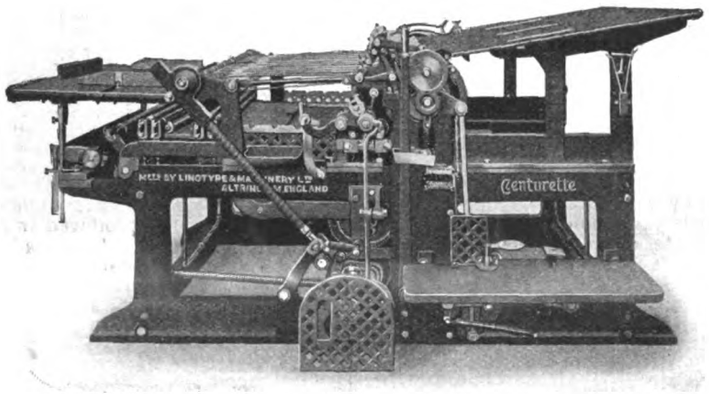
Mr. Claybourn's Investigations.

At first, I learned, he gave all his time and research endeavour to producing a perfect printing plate. This he finally accomplished. But, that done, he found he hadn't even made a start. Too many other factors play their part in good printing. Perfect printing, he found, did not hide entirely behind the printing plate. He had to start all over again. This time he started again at the bottom, only from an entirely different angle.

The artist's sketch came first within the line of investigation. Every conceivable colour was found on the pallette, from which pictures were produced that the pressman was expected to reproduce faithfully but never did achieve. Claybourn is an artist himself and possesses the artist's instinct. Besides he knows technique. So the artist and his methods were surveyed, tests made, new theories evolved, exploited, accepted or discarded, until the work of that department came within a new range of perfection. It was obvious that process colour work could not be followed out satisfactorily with four colours when the artist used eight and sometimes more colours in preparing his drawing. And it was found that hitherto unattained results could be achieved with the four base colours involved in process work by adopting new methods.

The thing that impressed me most about the whole thing was the fine detail with which everything has been carried out. No one not intimately acquainted with every phase, feature and factor of art, photo-engraving, electrotyping, presswork, and possessing a flexible, comprehending mind that can adapt itself at once to engineering, drafting, and mechanics of every conceivable kind, could possibly cover all the ground and come anywhere near achieving the results attained by Claybourn. He had to run the entire distance, and he registered a perfect goal in every one.

New Working Methods.



Preparation of the original engravings follows new lines. Instead of all the dead metal being routed away, it is all left. The router bit is merely run around the detail matter, and the balance is left as a bearing-off surface, affording protection to finest detail in the process of electrotyping or lead moulding. Isolated portions of the plate which ordinarily stand out in the open, are thus preserved instead of being broken down. Claybourn is unalterably opposed to printing from original engravings. His point is entirely tenable and well taken. The originals are too valuable to be entrusted to the numerous dangers that may befall them in the process of printing.

In platemaking by the Claybourn process all the ingenious machinery that has been perfected comes into play. Chief of these machines is the correcting and solidifying press, which is also a lead moulding machine. The treatment of the plate after the shell has received the backing metal is unique. It goes into the solidifying and correcting press first to be trued to an absolutely even plane of surface on the printing face. It then receives the solidifying treatment, which takes every imperfection out of the backing metal. In the process the backing metal is actually made to flow under pressure, excess material flowing upward into the solidifying plate. Upon first withdrawal the back of the plate shows plainly what the pressman would have had to do by way of make-ready to make the plate print perfectly had it not undergone the correcting and solidifying process. The toothed areas of the solidifying plate, of which there are three, each adapted to different classes of work, plainly leave an indention on the back of the plate, showing the high and low spots and other inequalities.

The solidifying and correcting press is not large, yet it incorporates more unique features than the most ponderous lead-moulding machine known to the electrotyping industry to-day. Though the machine is subjected to stresses and strains that seem almost unbelievable, it is all done so noiselessly that one hardly can appreciate that all the things *accomplished transpired* during the short time the plate was within the machine. Tonnage pressure can be set at any desired point up to 1,000 tons. When the pressure reaches that point the machine recedes and

THE

THOMPSON TYPE, LEAD & RULE CASTER

Reliability of a typecaster consists of the high quality of its product at a cost low enough to make non-distribution economical.

Thompson quality is a standard of accuracy not surpassed even by typefounders.

Simple, complete and compact, using Linotype, Intertype and its own matrices interchangeably, the Thompson produces more type than any other typecaster on the market and equals the out-put of two of some other makes.

Type in all languages from 5 to 48 point, leads, slugs and rule 2 to 12 point, accurate in every detail, are produced on the Thompson Type, Lead and Rule Caster.

THOMPSON TYPE MACHINE CO. 223, W. Erie St., Chicago, Ill., U.S.A.

Digitized by Google

the power is automatically cut out. A depth gauge at all times registers the density to which the solidifying plate is penetrating. The machine is simple and so finely balanced that every movement is one of grace and ease. There is no strain or groan.

After first withdrawal it may be found the plate corrected must be shaved and again returned to the press for another treatment. As originally prepared, the backing metal is somewhat thicker than the finished height of the plate. This surplus metal is absorbed in solidifying and the balance shaved off by the Claybourn flat plate shaver. The machine is radically different in construction and operation from other machines doing like work. Its chief feature is the construction and operation of the shaving head and knife. The former is much heavier than any other machine; the latter is provided with a series of hardened steel rollers spaced at intervals of about ¾ of an inch across the surface of the shaving knife. Each roller is provided with a torsion spring. The function of the rollers is to hold the plate firmly and snugly against the platen while the shaving is progressing. No buckling, stretch, warp or distortion can occur because of this feature. There are so many salutary features about this new shaving machine which are real innovations that I could make a story of it alone.

Claybourn Precision Machinery.

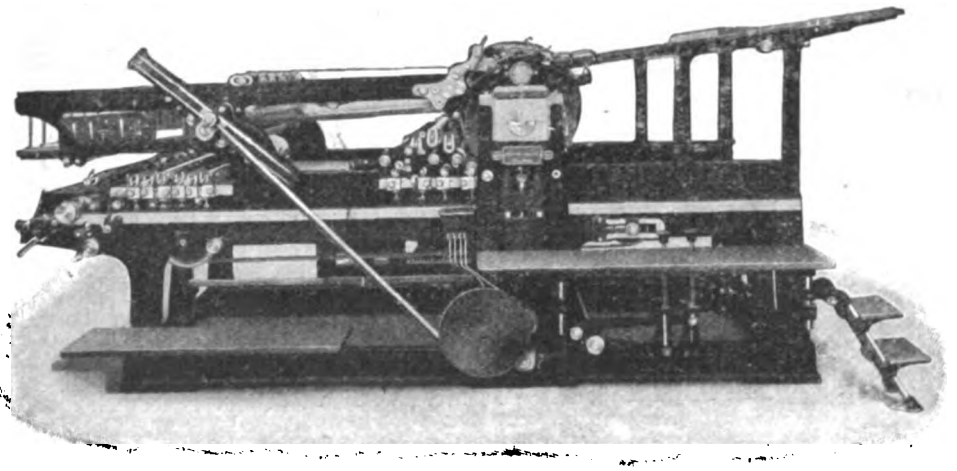
Now Claybourn takes the plate to the Claybourn proof press and in a few minutes he has a proof that is in every respect a counterpart of what the finished job will be like. In its every feature of construction and operation this press embodies the same principles which are incorporated in the cylinder press. Cylinder, bed, fountain, rollers, grippers, guides, tympan, packing, and all, follow the same identical details as its larger brother, the cylinder press. In all my experience as a printing engineer who has given particular time, thought, study and research to presses, I have never inspected or witnessed in operation a press which presented so finished an appearance as the Claybourn proof press. I saw this press doing the highest grade colour work—better than cylinder press work having hours of make-ready—yet there was never a spot of overlay or underlay on work produced on this machine. It is the finest bit of co-operative aid the pressman has had since printing was invented.

After producing the perfect plate Claybourn got nowhere with the pressman if the latter's presses were out of tune with his principles of precision. Investigation and research disclosed that more inequalities existed in the cylinder and rotary press than in plates. Beds were found out of true with cylinder, the latter out of periphery, unstable in travel, not in register, etc. All these faults are overcome by the Claybourn Process of press correction. In fact, so fine are the lines of precision and accuracy drawn through the workings of this process that a form of plates can be transferred from one corrected press to another, and identically the same results obtained on each without recourse to make-ready.

Practically all my life has been spent as a presssman and in engineering, experimental and development work involving the cylinder press. If anyone had told me before I inspected the Claybourn Process, and witnessed the results, that you could print the most elaborate work without make-ready, and do it with a "kiss" contact instead of pressure, I would have looked upon him as an escaped lunatic. Claybourn is doing this thing and doing it so thoroughly, with the finished result so beautiful, and right before you, that one instinctively rubs his eyes to make sure it is not a dream. It is an actuality.

Australian News-Print.

Prospects of Local Manufacture.



A further stage has been reached in the interesting investigation which is being made by the Institute of Science and Industry in Australia with a view to determining whether paper can be manufactured from Australian timbers on a commercial scale.

Sir George Knibbs, director of the Institute states that the standard paper used for newsprint consists of 25 per cent. chemical pulp and 75 per cent. mechanical. The results of the investigations to date indicate that chemical pulp can be produced in Australia at an outlay sufficiently low to admit of its use in the manufacture of news print. The question of manufacturing mechanical pulp has yet to be considered in detail. It will now apparently be practicable to carry this side of the inquiry to a satisfactory conclusion, in conjunction with the forestry departments of the several States, as a result of the agreement between the Federal Government and the State Premiers to develop the Institute's work on a co-operative basis.

The importance of timber research has been in view at the institute for some time, but hitherto, owing to the lack of funds and the absence of necessary facilities in the way of laboratories and expert staff, it has not been possible to make a beginning with the work. In other countries comprehensive tests have been carried out on standardised methods, so that results may be fully comparable.

Most men with swelled heads wear small hats.

The Latest "K. & B."
Two-Revolution Single-Sided Press.

The
Last Word in Flat-Bed Presses

It contains improvements never previously embodied in this class of press, which produce an efficiency and smooth running ——— hitherto unapproached. ———

Can be seen running in London any time by appointment.

PRINTING TRADE EXPERTS pronounce it to be the
Finest Two-Revolution Press in the World.

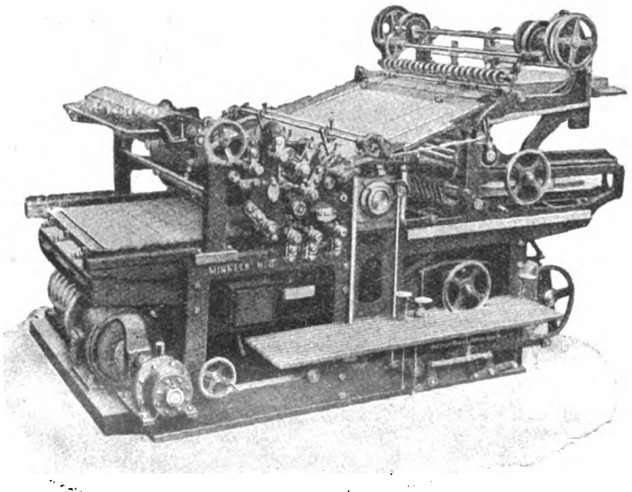
Are you planning for the new Postal Regulations ?

After December the Post Office will not acce t envelopes with tucked in flaps when they exceed 4½ in. in width. This will mean a larger demand for commercial and pocket shapes with tongue flaps.

We can supply you with "LEADER" envelope machines without drying chain, which will produce these shapes at a high speed, the output being more than

50,000 per day.



DAVID CARLAW & SONS, Ltd.

The TRADE "LEADER" MARK.
Envelope Machine.

The "WINKLER" High Speed Automatic Art Press.

With Oscillating Cylinder and Printed-Side-Up Delivery Without Sticks.

Discriminating printers recognise it to be the ideal machine for producing Fine Half-Tone and Multi-Colour Work.

Unequalled for Dead Register, Rolling Power, Impressional Strength, Speed and Noiseless Running.

Occupies only about half the floor space of a two-revolution machine for the same size of sheet.

The middle inking roller is of smaller diameter, thus eliminating any possibility of circumference marks on solid surfaces.

The forme is supplied with **fresh** ink from **all** inking rollers both during the forward and backward space movement of the bed.

To prevent "picking" when printing difficult work on art paper **electric heating** of the bed is provided, the inking rollers being specially **water-cooled.**

Automatic Cylinder Check, Throw-off of inking rollers and Slow Motion.

Trade Notes.

The Salisbury Supply Co., printers and stationers, have presented a petition for the winding up of Benz Motors (England), Ltd,

Of interest to many printers, stationers and manufacturers of office supplies is the Business Efficiency Exhibition, to be held at Cardiff, from October 15th to 25th. Particulars can be obtained from Office Appliances Trade Association, 37, Strand, London, W.C.2.

The names of Mr. A. Pitman and Mr. I. J. Pitman, both publishers of Bath, are given as the directors of a new company, Dun Mallard, Ltd., registered with a capital of £1,000 to acquire property and act as capitalists, builders, constructors of wharves, roads, etc.

British Trade Ship.—Mr. Godfrey Cheesman, general secretary of the National Union of Manufacturers, issued a statement in regard to the British Trade Ship. The president of the union, Mr. John Walker, he says, views the project as one of great national importance, and the union have placed office accommodation at the disposal of the promoter, Commander Roderick Day, for some time past. They have also lent clerical assistance. The union, as a body, is in no way running the British Trade Ship, but will undoubtedly give considerable support to the scheme.

Rochdale and District Printers' Guild.—On the 8th inst., the final was played at Healey for the Guild Cricket Shield between the *Rochdale Observer* and the Combined Team. The Combined Team won scoring 81 runs to the *Observer* 56. The result of the bowling tournament was: 1st, Mr. C. Morgan, *Observer*; 2nd, Mr. H. Wild, *Observer*; 3rd, Mr. F. Sladen, Yates.

On Tuesday, the anniversary of the death of Lord Northcliffe, the following two items appeared under the "In Memoriam" heading in *The Times*: "Northcliffe.—In grateful memory of Viscount Northcliffe, who died August 14th, 1922, for 14 years a principal proprietor and a devoted servant of *The Times*. Northcliffe.—In ever-grateful and and affectionate memory of my chief, Viscount Northcliffe, who died August 14th, 1922. There has never been anyone just like him before, and there never will be again, and the world is the poorer for his death."

Viscount Northcliffe's grave in St. Marylebone Cemetery was visited during Tuesday by relatives, friends, old associates in journalism, and by former servants, many of whom brought wreaths.

The death has occurred at Oxford of Mr. George Sheppard, principal of the well-known Oxford printery of Sheppard and Co. Mr. Sheppard was a highly qualified technician, and his firm had been entrusted with much special work for the University.

After a long illness, Mr. G. A. Roberts, chief reporter of the *Bath Chronicle*, died at Bath on Saturday last.

Extraordinary honours were paid to the memory of the veteran journalist, Mr. Edwin M. Hood, at his funeral at Washington, on Saturday. The British and other Embassies as well as the State Department were represented, and a wreath from Sir Auckland Geddes, the British Ambassador, was prominent among the floral offerings. Mr. Hood was one of the representatives of Reuter's Agency in Washington.

The *Clarion*, in its last week's issue stated that its intended cessation would be deferred for a fortnight, there being some possibility of readers of the paper coming forward to arrange for its continuance. It is stated that, should the *Clarion* close down, the Utopia Press, the printing department of the paper, will have to be discontinued, unless further money can be found to finance it; £3,000, the valued price, is required, of which £1,000 is promised, to purchase the machinery and plant, and the remainder of the lease of the building, which is modern and fulfils all the County Council requirements, and has five floors. The Press has a fairly good outside printing connection.

A copy of the first number of the *Daily News*, dated January 21st, 1846, edited by Charles Dickens, together with a "trial specimen copy," dated two days earlier were offered for sale at Hodgson's on Tuesday. Bidding started at 10s., and the lot was withdrawn at £10 as the reserve price was not reached.

The Institute of Journalists has completed its list of members for the current year. Names of effective members—Fellows, Members, Junior Members, Honorary Members and Associates are arranged alphabetically, the address, name of paper, and other information being given in each case.

"Circulation is not the alpha and omega of a paper," said Mr. Dingle, returning thanks for re-election as editor of the *Foresters' Miscellany*, at the High Court of Ancient Order of Foresters last week. "God help the editor of a paper who depends for circulation on the issuing of insurance or other coupons," continued Mr. Dingle. "The British Press was at one time the admiration of the world. To-day we find subjects that matter crushed out and the columns filled with racing and divorce cases that are sapping national life."

Silhouette Exhibition.—Some impetus may be given to the use of silhouettes in decorative printed matter—on box tops, calendars, greeting cards, etc.—by the very representative collection of silhouettes which Captain Desmond Coke has presented to the nation, and which are now exhibited at the Victoria and Albert Museum. The art of the silhouette, whether painted or cut from paper, has of late years received increasing attention from the collector, both in this country and the United States, and interest in the subject has been greatly stimulated by the researches of Mrs. Nevill Jackson and Mr. Desmond Coke. The latter's book "The Art of Silhouette" is one of the few important works on the subject. The collection is open free daily from 10 to 5 p.m. (Sundays 2.30 p.m. to 6 p.m.).

The prompt action of a number of employees prevented what might have been a serious fire at the Ely Paper Mills, Ltd., Cardiff (Messrs. Thomas Owen and Co., Ltd.). Smoke was seen to issue from the roof of a machine shed in the western portion of the works, but the fire was extinguished by the time the brigade arrived. It was found that a piece of timber underneath a sheet of corrugated iron had become ignited.

British Newspapers in Russia.—The Moscow *Isvestia* publishes a list of "bourgeois" British periodicals, which in view of "their sympathetic attitude towards the Soviet Government" and the fact that they "refrain from publishing hostile attacks and libels on the Soviet system," are permitted to circulate freely in Soviet Russia. The list of specially privileged English periodicals includes only the following: *Daily Herald*, *Manchester Guardian*, *Daily News*, *Daily Chronicle*, *Observer*, *New Statesman*, and *Nation and Athenæum*. The Press Department of the Commissariat for Foreign Affairs announces not only that these English papers may freely be imported into Soviet Russia, but that the Department itself and its branches and book shops will in future accept subscriptions to and advertisements for them.

Bogus Tram Tickets.—Several arrests have been made in Cape Town and Johannesburg of a sensational nature, bearing upon the printing and issue of bogus tramway tickets. It appears that a secret press was installed at Jeppestown, and that a vast quantity of tickets was printed there, which were such an excellent imitation of the official tickets that only the skilled eye of a printer could tell the difference. The loss to the town is estimated at between £5,000 and £10,000.

Strikes of printers in Berlin have caused suspension of newspaper production and seriously hindered the printing of paper currency.

M. Bernard Grasset, a well-known Paris publisher, died suddenly on Monday.

Catalogues for Norway.—The Commercial Secretary at Christiania has forwarded a list of certain Norwegian Government Departments who are desirous of receiving catalogues from British firms. The list, which sets out the nature of the requirements of these Departments, can be consulted by United Kingdom firms interested on application to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1.

Describing the worthlessness of Austrian paper money, Sir Arthur Salter, director of Economic and Finance Section, secretariat of the League of Nations, says he has seen Crown notes being used as waste paper for scribbling. The Crown note was worth one-thousandth part of a penny, but actually it cost ninety times as much as the paper was worth to print it.

Trade Union Matters.

Excessive Overtime Fines at Londonderry.—The Executive Council of the Typographical Association have accepted a recommendation of the Londonderry branch to impose a fine of 10s. each on members of a newspaper chapel in that branch who had refused to appear before the branch committee to answer a charge of balancing time and working excessive overtime.

Christmas Card Printers and Piece Rates.—At a recent meeting of the Executive Council of the Typographical Association a report was received from the North-Western Group of the Association intimating that an application had been received from the Mid-Lancashire Christmas Card Manufacturers' Association for reductions in piece rates, and asking for the Council's permission to enter into negotiations on the subject. The group also asked for the attendance of Mr. T. Roberts at the proposed conference. The Committee granted the necessary permission for the holding of the conference and appointed Mr. T. Roberts to attend.

"Natsopa" Film.—Arrangements are being made by the National Society of Operative Printers and Assistants to make a film showing the ordinary activity of the Society as well as the activity at the Memorial Home. It is proposed to utilise part of the Society's Educational Fund for this purpose. The film, when complete, will be shown at meetings of members and their friends in all branches.

At a meeting of the London Trades Council on Thursday evening Mr. W. W. Howe, assistant organiser of the Platen Printing Machine Minders' Society, moved, and Mr. Jackson, of the Vehicle Builders, seconded, that "owing to gross misrepresentation made by the newspaper Press from time to time of the position of the workers in trade disputes, the Trade Union Congress should be asked to consider ways and means of exercising a Press censorship." Delegates who opposed the motion wished to know how such censorship could operate. They pointed out that the task of such a censor would be enormous, for not only the London papers, but the provincial daily and weekly Press would have to be dealt with. No editor worthy of the name, said one, would allow any dictation as to what he should print. The finest censorship they could have was that of public opinion. The motion was rejected.

The death is announced of Mr. John McParland, president of the International Typographical Union (U.S.A.). He died at St. Vincent's Hospital, Indianapolis, on June 16th, after a period of ill-health. Mr. McParland, who was born in Talbot, Australia, January 6th, 1868, has been one of the important figures in the American printing world for many years, and was elected in 1920 to the head of the Typographical Union, and was re-elected in 1922. Before his election Mr. McParland was for many years a conspicuous figure in the "Big Six," the New York Typographical Union.

The business premises of the Civic Press trade-union owned printing concern and *Forward* were endangered by fire at Glasgow on Saturday. The outbreak occurred in a warehouse in the same building, at Howard-street, but was prevented from getting a hold of the flat in which *Forward* is printed.

Australian Dumping Duties.—The High Commissioner for Australia is officially advised that playing cards from the United States have been brought under the operation of both Sections 4 and 5 of the Customs Tariff (Industries Preservation) Act.

The Waste Paper Merchants Association of New York has petitioned the Attorney-General to bring an action vacating the charter of the Salvation Army on the ground that as a religious and charitable corporation it is violating the provisions of the act under which it was created by conducting an extensive waste paper business.

"The Placard and Service Billposter," the house organ of Messrs. Sheldons, Ltd., poster specialists of Leeds, maintains its usual high efficiency in the July Issue. Containing 56 pages in all, this organ deals in interesting fashion with current posters, putting forward criticism and suggestions appertaining to the lay-out and general display adopted by well known every-day advertisers.

Printers' Managers and Overseers ASSOCIATION.

The Seeley Cup Competition.

This long-looked-for event was played on the green at the Bear and Staff Hotel, Gateacre, on Saturday last, when the Manchester members of the P.M. and O.A. were the guests of the Liverpool Centre. It was early seen that the players from Cottonopolis were no match for the trundlers of Shippingopolis, who had been training for the past two years under their able captain, Mr. C. Peate. The green was in excellent condition, being very fast, and having a certain peculiarity unknown to those who were strangers. There is a familiar quotation that "All roads lead to Rome," and it was not until the match was finished that the Manchester members were informed that the phrase had been modernised, the knowing tip being "All woods trundle to the pub." The next time Manchester players meet Liverpool on the same ground they are obtaining woods from Pussyfoot, so that they will go straight to the jack.

The following is the result of play :—

LIVERPOOL.		MANCHESTER.	
Ball, P.	21	Hellewell, A. ...	4
Cain, W.... ...	21	Ball, J.	8
Caldwell, H. ...	21	Paterson, G. W. W.	6
Dyson, B. ...	21	Scouler, F.... ...	10
Edwards, H. ...	21	Balls, E. C. ...	12
Field, R.... ...	21	Winstanley, J. ...	20
Graham, J. ...	21	Fisher, E.	8
Mackie, C ...	21	Hughes, F. J. ...	12
Martin, F. ...	19	Smith, W.	21
Maxwell, W. ...	19	Robinson, F. E. (captain) ...	21
Peate, C. (capt.)	21	Mayo, Jas. E. ...	8
Pitney, H. ...	21	Goat, Chas. ...	5
Roberts, W. E....	13	Young, A.... ...	21
Rignall, T. ...	21	Gavin, A.... ...	20
Wilson, J. ...	21	Knowles, Chas. N.	9
	303		185

After a substantial and enjoyable tea, President Mackie, on behalf of Liverpool, welcomed Manchester, and congratulated them upon accepting defeat as true sportsmen should. Such meetings as those he said, were beneficial to all concerned, and no one should attempt to put obstacles in the way of unity.

Captain Peate said he had every confidence in his team, but was surprised at the great trouncing they had given to Manchester. If his team played as well when it met Yorkshire he was sure the cup would find a resting place in Liverpool.

President Robinson stated that so far as the outing was concerned, the pleasure was that of Manchester. His bowlers had fallen far short of expectations, as he thought, after reading the Liverpool scores against the Great Eastern, there was not much effort required to win. They had lost, and took their defeat in a sporting spirit, hoping that when Liverpool met Yorkshire they would be in the same form, and then success would be theirs. Manchester thanked Liverpool for their generosity, and, at a later date, hoped to reciprocate the kindness. He always had been a great advocate of more unity between the two Centres, and he would be delighted to see increased social intercourse, seeing that travelling expenses were coming within reasonable bounds. He would not like Liverpool to go away confident that they would beat Yorkshire, otherwise they might be like Manchester, and have to suffer defeat.

Secretary Poole, who had just returned from a holiday in Leekland, said that Liverpool and Manchester were Lancashire, and he did not care which of them won so long as the team that met Yorkshire would bring back the cup to Lancashire. Manchester appeared to be pessimistic about the game, whilst Liverpool were optimistic all the time, and their confidence had stood them in good stead. He admired several of the Manchester members present that day, among them being Messrs. Robinson, Rignall, Scouler and Caldwell. It was often remarked that there were more acres in Yorkshire than there were letters in the Great Book, but he would say there were more people in Lancashire than in any other county, and when some of them did meet Yorkshire they would show who were the champion trundlers.

Secretary Hughes remarked that such gatherings always proved beneficial, but he regretted that there was one member absent who would have enlivened that assembly by his presence. Mr. Seeley, the donor of the cup, which was given originally as a link of good comradeship, unfortunately was unable to be with them, but he hoped to be there at the final competition to see the best team win. Manchester members had not been as enthusiastic as they might have been, and now that they had been thrashed by Liverpool and bowled out by Yorkshire, next year they would take up in earnest the ancient game. As President Mackie had mooted more of such competitions he thought the members of the Centres should subscribe for another trophy, in order to create more matches and greater cohesion.

Messrs. J. Wilson, Thos. Rignall, and Chas. N. Knowles (first Manchester secretary) also added their appreciations.

Mrs. Poole and several other ladies were present, and as Faith, Hope and Charity brought good luck to their favourite team, we suggest that Yorkshire bring a bevy of ladies on the final day if they desire success, and also a reliable guide who will be able to convey them safely home.

WEE MAC.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

CANADA.

His Majesty's Trade Commissioner at Winnipeg (Mr. L. B. Beale) reports that a firm in Manitoba, Canada, desire to be placed in touch with United Kingdom manufacturers of school fountain pens and kindergarten supplies. Reference 11735/ED/MC/B.

UNITED KINGDOM.

An enquiry has been received for the names of British makers of painted or printed heavy paper or parchment for lamp shades. (Reference No. 125.)

SWITZERLAND.

An agent resident in Switzerland is desirous of obtaining the representation of British firms for the sale of novelties in the stationery trade. (Reference No. 150.)

SOUTH AFRICA.

H.M. Trade Commissioner at Cape Town reports that a bank with its head office in Cape Town is desirous of receiving catalogues from British manufacturers of loose leaf ledgers. (Reference D.O.T. 11703/E.D./M.C./2.)

POLAND.

An association in Warsaw desire to secure the representation of English firms manufacturing carbon papers, typewriting requisites, etc., addressing machines, calculators, perforating machines, numerators, and office furniture. (Reference No. III.).

The "Daily Herald's" Position.

Mr. George Lansbury, writing in the *Daily Herald*, states that that newspaper has increased its circulation by about 160,000 copies daily since the reduction of price to 1d. He stresses, however, the need for further increase, drawing attention to the great expense involved in establishing a daily newspaper.

"Some may say," he writes, "we have spent a large sum of money on the paper, and ere this it ought to have paid its way. We have not raised a tenth of the capital any group of capitalists thinking of starting a daily paper would consider it necessary to raise.

"Very quickly we must get another 200,000 readers, or we shall be not merely in rough water, but on the rocks. This is the cold brutal truth. Do not imagine this is another of George Lansbury's periodical screams. In a way it is, but as a matter of fact the position is much more serious than ever before, because we have been obliged to dare everything in order to reach the relatively excellent position we find ourselves in to-day. The joint bodies, recognised as the leaders of our movement, have done all that is humanly possible to give the paper a chance. If the rank-and-file, of whom we often hear so much, had been as enthusiastic and hard-working as the leaders who meet at 32 and 33, Eccleston-square, we should long ago have secured the 500,000 circulation we went out for last September."

How the Exchange Chaos Hits the Printer.

SIR—A glaring incident proving the absolute necessity for exchange stabilisation has just come to my notice. The case appeals to me particularly at the moment because my firm have just sent out 5,000 circulars relating to a British engineering product, and, further, because about two years ago I toured Great Britain at the direction of one of the leading London daily journals in special reference to the stabilisation of the money rates of exchange. The Austrian rate of exchange has been stabilised in the meantime through the efforts of the League of Nations, although one of our late Chancellors of the Exchequer declared in the House of Commons that "You might as well ask the master of a ship in the middle of the Atlantic to stabilise his craft as ask somebody to stabilise the Exchanges of Europe." However, to get to the present incident.

The 5,000 circulars referred to above cost in British postage ..	£10 8 4
5,000 envelopes made in London ...	3 15 0
5,000 circulars printed in Birmingham	5 5 0
Addressing by a British citizen (out of situation—a temporary job just to help)	5 10 0
	£24 18 4

Due to the general depression it would pain me to report the result of the issue of these circulars, but that by the way. This morning we hear from a firm in Berlin offering to supply the same size circular, supply the envelopes, address them, enclose a printed addressed envelope (this is additional to what we have just sent out), and provide the postage and post them from Berlin to 5,000 firms in Britain from our list or their list of addresses for the total of £9 5s.

This letter from Berlin is being sent all over this country, and the firm is simply trading on the fact that since the German postage rates were last fixed the exchanges have depreciated still further, and this enables them to post these circulars at such a low cost that they can include circulars, envelopes (two sets), addressing, and posting, all for less money than the cost of postage in this country. The firm send samples of the circular and the envelopes, which are as good as the British ones we sent out.

Your readers will be able to form their own opinions on the anomaly, but it makes one ask, "When is the farce going to be stopped?" The same unfair anomaly hits all of us in various ways in trade with France and Belgium and Italy and many other countries.

—Yours faithfully,

For and on behalf of the Judson-Jackson Company Limited, J. JUDSON, Director.

50, Marsham-street, Westminster, Aug. 9.

Bowater's Enterprise.

New Paper Mill on the Thames.

Messrs. W. V. Bowater and Sons are to be congratulated on the excellent site they have secured at Northfleet for the building of a "news" mill on up-to date lines.

Evidently no time will be lost in proceeding with the undertaking. According to present arrangements, two of Walmsley's famous fast-running machines, 221 inches wide, will be installed.

The mill will be situated on the banks of the Thames, opposite Tilbury Docks, on a site formerly known as the Old Northfleet Dockyard. Steamers will be able to arrive alongside the wharves with raw materials, coal, etc. The finished product can be easily conveyed by water to the firm's warehouses in London, or if necessary by motor or rail.

As is well known, Messrs. W. V. Bowater have very extensive connections in the supply of news print.

PAPER merchants in Bombay, Calcutta and Delhi report a growing demand for kraft and wrapping papers throughout the country. There are two distinct features to this demand—the Bombay cotton mill market and the general bazaar trade.

Necrology

Mr. H. V. Beedell.

We regret to chronicle the death under tragic circumstances of Mr. H. V. Beedell, principal of the printing house of Ed. Couchman aud Co., Ltd., of 15, Moorgate-court, E.C.2, and son-in-law of Sir J. J. Baddeley, ex-Lord Mayor of London. Mr. Beedell was involved in a motoring accident toward the end of last week, and later died in a nursing home from the injuries sustained. The funeral took place at Hendon Cemetery, Mill Hill, on Tuesday.

Mr. David Cowan.

The death occurred suddenly, on Tuesday of last week, at Ulvik, Hardanger, Norway, of Mr. David Cowan, who was for 26 years a member of the staff of *The Times*. He had gone to Norway for a holiday, but became suddenly ill and died of heart failure. Educated at King's College School and at Trinity College, Cambridge, Mr. Cowan was called to the Bar before he entered journalism. In 1897 he joined the Foreign Department of *The Times* as a temporary helper, and his marked abilities, particularly his linguistic powers and knowledge of foreign affairs, made him a valued servant of *The Times*, with which journal he continued for over a quarter of a century, being engaged at first as an assistant in the foreign sub-editorial department and latterly as head of the room.

The Late President Harding.

High tribute to the memory of the late President Harding is paid by the United Typothetæ—the employers' organisation of the printing industry of the United States. On the cover of the organisation's *Bulletin* for August 6th is printed the following, under the heading "The Printer-President has Passed Away":—

"The strife torn world has learned that it has lost a sincere friend; the nation an honest and earnest public official; the printing craft its most illustrious member.

"President Harding was typical of the best in the American nation. He would have been glad to call himself an *average* American. He rose to the highest position in the gift of the greatest nation on earth by hard work, conscientious and honest dealings with his fellow men and a knack for making friends that has characterised all his public deeds.

"Like Lincoln, he was a 'small town' man by birth and upbringing. And the rugged honesty and conservatism generally attributed to the 'small town' population guided him all through life—as a farmer, as a newspaper man, as a politician and as the president of the nation.

"May his memory long live among us!"

Mr. Harding's Estate.

Mr. Harding left estate, according to well-informed estimates, of the value of three-quarters of a million dollars (£150,000 at par), making his wife the chief beneficiary. His share in the Marion *Star* was recently sold for $424,000 (£84,800), and he recently sold his Washington residence for $50,000 (£10,000). The other assets include shares in various banks and Ohio industrial concerns aggregating about a quarter million dollars (£50,000).

Mrs. Harding has considerable estate herself, and, in accordance with custom, it is probable that Congress will vote her a life pension of $5,000 (£1,000).

Swiss Import Regulations.

The "Recueil des Lois Fédérales" for July 25th contains a Decree of the Swiss Federal Council and a Decision of the Federal Department of Public Economy, both dated July 18th, and effective as from July 25th, which modify the import prohibitions in force in Switzerland.

A General Licence has been accorded for the importation over all frontiers of the following:—Pasteboard covered with paper of a natural colour (Tariff No. 310); albums for pictures and post cards (Tariff No. 338*a*).

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion 3/0
Three Insertions 6/0
For every line exceeding three lines 1/.

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion 1/6
Three Insertions 3/0
For every line exceeding three lines 6d

Sales by Auctions, Tenders,
Patents for Sale,
Legal and Financial Announcements

Per line 1/0

Paper Standardisation Conference.

Further Investigation Proceeding.

Progress in the discussion of paper sizes is steadily gaining, and the wide interest in the matter was shown by the fact that the conference at Washington on June 19th brought out over 80 representatives of various manufacturing and industrial interests, says the New York *Publishers' Weekly*. Book publishing was represented by Robert McGlaughlin of the National Association of Book Publishers.

These conferences, which are the outgrowth of work done by the Bureau of Standards in the Department of Commerce, are proceeding with the idea that, while they cannot enforce any rules as to paper sizes, they can by gathering the facts and placing them in an authoritative way before the users of paper, demonstrate so clearly the economies to be gained from a lessening of paper sizes, that reforms will proceed under their own headway. The Bureau of Standards has already been of great service to other industries by helping outline standardisation and thus bringing about enormous savings.

It is pointed out that papermaking machinery can run off long rolls of single width with very much economy over changing sizes that necessitate constant shifts of machinery. The jobber, on his part, is enabled to carry more complete stocks, and the publisher is enabled to prepare to manufacture his books with less delay.

A careful canvass among book publishers has shown that there are a number of special paper sizes being used that could be largely eliminated on new books and gradually eliminated on old books or reprints. A very considerable concentration on the 30½ by 41 and 41 by 61 size has already made it much more easy to obtain paper supplies in those measurements.

Just what the complications are in paper sizes in trade paper printing at present is shown by the Department's statistics that show there are 95 different paper sizes used in trade papers, 85 sizes used in house organs and 179 sizes used in trade directories. It would be hard to prove that such divergence had done anything to improve the appearance and useableness of the books.

As the result of this conference, some further investigation is being made in the trade before the final report of the committee is made.

Patent Plurality Envelope.

A novel envelope, just patented, aims at economy in the quantity of paper used at the same time providing an easy method for use in connection with inter-departmental correspondence of large business houses, public services, etc. Combined with the body of the envelope is a plurality of double flaps which are interleaved with the single flap and on removal leave the envelope intact. The use of the envelope is multiplied ten times over.

The patent rights for Great Britain are taken by Messrs. Taylor, Garnett, Evans and Co. (Hudson, Kearns, Ltd.), *Guardian* Printing Works, Manchester. Patents are also taken out in U.S.A., Germany and 14 other countries.

The new envelope is being placed on the market under the name of the "O.T.O." (office to office) envelope, which name is being registered as a trade mark.

Representatives also in Australia, India, South Africa, Canada, etc.

THURSDAY, AUGUST 16, 1923.

Printers' War Orphans.

A CHARITABLE call which should find many responsive hearers in the printing industry is that which makes known the needs of the children of printers killed in the War. In 1918 a Fund to meet these needs was instituted by the Printers' Pension Corporation. War widows throughout the United Kingdom were invited to make application for the proposed benefits. As a result, no fewer than 1,200 war orphans, one third of whom reside outside London, received weekly grants amounting on the average to £10 per child per annum. For the first four years of the existence of this Fund support was forthcoming, very largely from London. During the past year, however, a serious falling off in contributions has taken place, with the result that there is at present an overdraft of £12,000 which will be increased to £17,500 by the end of the year, unless subscriptions are immediately forthcoming. From its inception it was intended that the Fund should continue its useful work until the last child should have reached the age of fourteen years. This, however, will not be possible unless the printing industry can provide the necessary financial support. Indeed, the Printers' Pension Corporation, who generously undertook the organisation and management, are most reluctantly compelled to face the possibility of closing the Fund.

* * *

Some Whole-Hearted Support.

THE printing industry's characteristic generosity has in some directions been manifested in respect of this need. The majority of the London master printers and a number of provincial master printers have wholeheartedly supported the movement. The Scottish Alliance of Master Printers has assumed responsibility for the support of all the orphans in its own area, whilst the London employees have rendered very valuable help, the London Society of Compositors having contributed £6,500 and now having under consideration an annual grant of £600 until the whole amount expended upon the orphans of their late members is reimbursed. The Electrotypers' and Stereotypers' Society are undertaking the same liability. More than this, however, is urgently necessary, and the Federation of Master Printers is widely circularising its members bringing these facts to their notice—particularly in the provinces, where a very large number of orphans are being helped from this fund.

* * *

Aid of the J.I.C.

THE Joint Industrial Council of the Printing and Allied Trades is also giving its assistance in the orphans' behalf by circularising the industry making known what the position is. At the quarterly meeting of the J.I.C. held on July 11th, an appeal was made to the Council for its aid in regard to the Printers' War Orphan Fund. After the position had been explained at the meeting, the Council unanimously resolved that they should do everything possible to assist the Fund, and the Organisation Committee was asked to meet at once to consider what steps should be taken to make the appeal effective throughout the country and to ensure the attention of employers and employees being drawn to their responsibility in this matter. The Committee met on July 23rd, and resolved that special attention should be called to the national character of the appeal and to the onus resting on every section of the industry, both employers and employees, to provide the money necessary to support these children whose fathers have given their lives for the country. The Organisation Committee is accordingly doing its best to make the position known, being confident that it is only necessary for all the facts to be realised to ensure that the money will be promptly forthcoming.

* * *

Paper Trade Statistics.

IT comes as a little surprise to those who are interested in paper trade information to learn that the Federal Trade Commission at Washington has decided to discontinue its report on the production and consumption of pulp and paper. Considering the importance which Americans always attach to statistical information, this decision marks an important departure. The act of discontinuing the work is attributed to financial reasons. In making the announcement the Commission states that there has been considerable difficulty in getting complete and prompt returns as the work is done entirely on a voluntary basis. Moreover, the heavy increase in the expense of the Commission for its legal work has made it seem necessary to reduce the amount of appropriation allowed to economic and statistical work. The task of furnishing the statistics, which is no light one, has, however, been undertaken by the American Pulp and Paper Association. The success of the effort will be dependent, of course, upon the co-operation of the mills of the country, and as they have previously reported to the Federal Trade Commission, it is not thought likely that they will be less willing to file the same statistics with their own organisation. Although the details of the collection of statistics are rapidly being worked out, there may be some delay in issuing the figures for June.

* * *

Paper, etc., Imports from Germany.

FIGURES which have just been made public regarding the business done between this country and Germany during the first six months of 1923 indicate that paper and cardboard were imported from Germany to the extent of £1,030,60. The total British imports of the same class of goods from Germany during the whole of 1922 were valued at £1,153,800.

Personal.

Sir Rowland Blades, M.P., is again amongst the aldermen eligible for election as Lord Mayor of London for the coming year. The choice, however, is expected to fall on Sir Louis Newton on account of seniority.

Sir John Foster Fraser has been appointed editor of the *Caterer*, in succession to Mr. F. Bourne Newton, who had held the post for more than 40 years.

Sir Henry Lucy, to whom the world is already indebted for several interesting and valuable volumes of reminiscences, now gives us Vol. III. (Fresh Extracts) of "The Diary of a Journalist," Mr. John Murray being the publisher.

Mr. T. Moles, M.P., a member of the literary staff of the *Belfast Telegraph*, has been congratulated by the Dublin and Irish District Committee of the Institute of Journalists as being the first working journalist to be appointed a Privy Councillor.

Mr. Edward Joyce, J.P., has been presented with a pocket wallet and notes by the employees of the *Lincoln, Rutland and Stamford Mercury*, on his retirement from the management of that paper. The presentation was made by Mr. Fox Wright on behalf of the subscribers.

Mr. A. J. Daines, a past president of the Printing, Bookbinding and Kindred Trades Overseers' Association, addressed the members of that body on Tuesday evening at St. Bride Institute. The address, entitled "Some Problems," dealt interestingly with the many disharmonies met with in Nature.

Mr. George Donaldson, a member of the Liverpool News Guild and also of the Typographical Association, is the winner of the Liverpool Press Society's Golf Cup. There were 30 entrants, and the runner-up is also a member of the News Guild.

Mr. Morris Duparc has been the recipient of a presentation from the board of directors of the *Jewish Chronicle* on his completion of 50 years' service with that journal.

Mr. Arthur Cruse, who for 47 years has been a member of the staff of the *Hereford Times*, has been presented with an illuminated address and a purse of money on his retirement.

Mr. W. Brand, the president of the Nottingham Branch of the Typographical Association, has completed 21 years of service as father of the chapel of the *Nottingham Guardian*.

Mr. Hugh Savage, formerly of Stratford-on-Avon, and now editor of the *Cowichan Leader*, Vancouver, has just been appointed the new president of the British Columbia and Yukon Press Association. Besides being president of the local newspaper association, Mr. Savage has been a director of the Canadian Weekly Newspaper Association for the past two years.

Sir John Irwin and Mr. W. Gregory (of the Irish Paper Mills Co., Ltd.), were amongst those who gave evidence at the recent meetings of the Irish Free State Fiscal Inquiry Committee, under the chairmanship of Professor T. A. Smiddy.

At Farningham, on Thursday, 2nd inst., Lieutenant Meredith Spalding, D.S.C., Royal Navy, was married to Anne, daughter of Mr. and Mrs. Guy Evans, of Farningham Hill, Kent.

Lieutenant Spalding is the youngest son of Mr. Sydney Spalding, the head of the house of Spalding and Hodge, Ltd. After the ceremony, in brilliant weather, a reception was held at Farningham Hill, which formed a picturesque setting for a gay scene of uniforms and pretty frocks.

Good will is the cheapest thing in porportion to its value.

Cost of Government Printing.

Shelving Results of Inquiry.

Sir Charles Higham, who was a member of the select committee appointed to inquire into the cost of Government printing, has learnt to look with scorn on Government committees in general, and he inclines to the opinion that the labours of the committee dealing with the cost of Government printing represented so much wasted time. The need for reform in the direction he indicates is so evident that we quote in full a forceful protest which Sir Charles contributes to the *Daily Express*. He writes:—

Select committees appointed by the Government—not necessarily this Government, but any Government—have become utterly farcical, and they are so regarded by the public generally. More than that, there are a great many people who have grown to look upon these committees as merely a convenient way of shelving troublesome questions raised in Parliament.

A committee is appointed to investigate a certain matter to which attention is called in the House of Commons following, probably, a storm of public protest to which wide publicity has been given in the Press. Men whose time is valuable are asked to serve on the committee, and many people whose time is equally valuable spend hours giving evidence before them.

A report is published. The finding may be sensational or commonplace. The fate of the report seldom varies. It sinks into oblivion in a pigeon-hole in some Government office, unless a public spirited newspaper like the *Daily Express* starts a campaign for further action, or unusually energetic members of Parliament insist that the report shall be brought before the House. The time for a drastic change has come. If men are of sufficient mental calibre and efficiency to investigate an important matter of public interest on behalf of the Government they can surely be given wider powers that will ensure an effective result of their labours.

Extended Powers Required.

If, for instance, a committee is set up by the Government to inquire into alleged irregularities in any transactions carried out for the Government, and they arrive at the conclusion that there have been irregularities, it should be possible for the committee to take obvious action without referring back to the Government. These powers should extend even to obtaining a warrant for the arrest of any official if the committee is satisfied such a step is justified.

If a statement is made in a public report that irregularities have taken place, or that the committee consider certain officials are guilty of conduct for which they would be immediately proceeded against either in the civil or criminal courts in the ordinary way of business, it is certain that the committee have very good grounds for making such a statement. Surely that in itself is justification for their taking action at once.

Until such powers are given to these committees their appointment and the many hours they spend in obtaining evidence and compiling their report will be so much time wasted. The committee which inquired into the cost of Government printing, of which I was a member, felt this. So far as I am aware not a single one of the recommendations we made was acted on.

The public should demand that this ridiculous state of affairs be ended at once.

The Irish Republican "*Daily Bulletin*," in a final number published on Saturday, thanks the journalists who knew and honourably preserved the journal's secrets.

The staffs of the *Yorkshire Post* and the *Yorkshire Evening Post* held a "Wounded Warriors' Day" on Saturday on their new sports ground at Weetwood, Leeds, when about a hundred wounded ex soldiers from the Beckett's Park Hospital were entertained. A series of games including a golf tournament, skittles, quoits, and other attractions, had been arranged, for which handsome prizes were given, and a cricket match and tennis tournament played by the members of the club gave additional interest. Mr. D. B. Wilson, a director of the *Yorkshire Post*, attended and distributed the prizes, and Mr. A. H. Mann, the editor of the *Yorkshire Post*, was also present.

Printing Trade Conditions.

Reporting to the *Bulletin* of the Federation of British Industries on the subject of conditions in the printing trade, Mr. A. E. Goodwin writes:—

"Business in the printing trade is fairly well maintained. The final instalment of the reduction in wages agreed to last year came into operation early in July, and under the terms of that agreement neither employers nor employees can make any application for a revision of wages during the present year. It is certain that the reductions have had their effect in bringing down the cost of printing, with the result that firms who in pre-war days were large users of catalogues and circulars are being encouraged to revert to these methods of publicity. After a long period, in which labour matters have overshadowed all else, the Federation of Master Printers is now enabled to turn its attention to other phases of the industry. As instances of recent activities mention may be made that a sub-committee is to be formed to consider the question of standardisation (of printing blocks, types, paper sizes, and colours and the like), while meetings have been held with the representatives of the National Association of Wholesale Stationers and Paper Merchants with a view to closer co-operation and to preventing any overlapping between the two trades. These and many other questions have hitherto had to make way for the more immediate problems connected with labour. The fact that consideration can now be given to them is at least a sign that conditions are more closely approximating to those existing in pre-war days."

Baxter Exhibition.—In announcing the opening on Tuesday of an exhibition at 47, Leicester-square, where the Baxter Society have collected a thousand specimens of Baxter prints, the Society recalls the following facts about Baxter's services to the printing craft: "Baxter was the first to illustrate popular books by mechanical means in the colours of nature. He was the finest printer from wood blocks in the same colours up to his day. He made great improvements in printing inks. He was the first to unite satisfactorily the two arts of printing from plates and wood blocks in colours. He was the first to imitate effectually an oil painting in colours by mechanical means. He was a pioneer who took into the homes of the poor for the first time cheap, artistic, mechanically produced pictures." The exhibition is to remain open for ten days.

Brains do not wear out with work—they rust out with worry.

DIVIDENDS AND REPORTS.

WELDONS.—Including £9,798 recovered in respect of excess profits duty, an increase of £34,546 in the profits is shown by the report of Weldons for the year to June 30th, 1923. The net profit, after writing off depreciation on leasehold property, furniture, etc., and making allowance for taxation and reserve for depreciation of investments, totalled £53,538, and with the addition of £9,734 interest and transfer fees and £9,798 excess profits duty refund, the total profit was £73,071, compared with £48,525 for the previous year. With the addition of £40,077 brought in and after providing for the dividend on preference, preferred ordinary and deferred shares, including the dividend payable on the preferred ordinary shares, there remains to be carried forward £50,948.

HEYWOOD AND CO.—At the annual meeting of Heywood and Co., Ltd., publishers, Mr. Walter Judd, chairman and managing director, declared a dividend of 15 per cent. on the ordinary shares and 6 per cent. on the preference shares for the year ended March 30th, 1923, and, in continuance of an arrangement made some time since, distributed 3,730 deferred shares to the staff.

NEW COMPANIES.

JOHN RISSEN (1923), LTD.—Capital £5,000 in £1 shares; to take over the business of manufacturing stationers, bookbinders and printers, carried on by J. Rissen and H. E. Thomas, 44A, Clerkenwell green, E.C., and 4, Gospel Oak-grove, N.W., as John Rissen and Co., and to carry on the same and the business of paper, paper bag, box and account book makers, photographers, manufacturers of and dealers in fancy and other cards, etc. Private company. First directors: W. T. Fletcher, H. E. Thomas and J. Rissen. Registered office: 44A, Clerkenwell green, E.C.

HANNAFORD-MACINTOSH, CO., LTD.—Capital £500, in £1 shares; printers, publishers, advertising contractors, lithographers, block engravers, photographers, paper merchants and manufacturers, stationers, box makers, etc. Private company. First directors: H. S. Macintosh and P. Offord. Registered office: 11, Great Turnstile, Lincoln's Inn-fields, W.C.

CARRON GROVE PAPER CO., LTD.—Capital £100, in £1 shares; manufacturers of paper and pulp of all kinds and articles made from paper pulp, esparto and other like substances, paper mill owners, merchants and agents, fancy box manufacturers, stationers, printers, etc. Private company. Subscribers: A. Carter and J. S. Magrath. Registered office: Carron Grove Paper Works, Denny.

ECONOMY STAMP CO., LTD.—Capital £200, in £1 shares; to acquire offices at 238, Blackfriars-road, S.E., to issue blue economy stamps to tradesmen and others entitling the holders to receive goods in exchange for such stamps from the trader issuing 3d. blue economy stamps in such manner as the company may decide to sell such stamps to tradesmen and others; to carry on business as grocers, house furnishers, printers, publishers, etc. Private company. Subscribers: C. R. Pearch and S. H. Dobson. Directors by subscribers. Registered office: 246, Old Kent-road, S.E 1.

A. AND F. WATKINSON AND CO., LTD.—Capital £2,000, in 1,500 preference shares of £1 and 10,000 ordinary shares of 1s.; to take over the business of a wholesale paper and cardboard merchant, paper and cardboard mills, agent and stationer, carried on by A. F. Watkinson at 27-29, Carter lane, E.C.4, as A. F. Watkinson and Co., and to carry on the same and the business of box makers, bookbinders, etc. Private company. Directors: A. F. Watkinson and Mrs. M. E. Watkinson. Registered office: 27 and 29, Carter-lane, E.C.4.

CANNON PAPER CO., LTD.—Capital £500, in £1 shares; manufacturers of and dealers in paper, and articles made from paper or pulp, and materials used in the manufacture or treatment of paper, including cardboard, railway and other tickets, millboards, and wall and ceiling paper, etc. Private company. Subscribers: C. H. Clayton and W. C. Powell. Directors by subscribers.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

HUNTERS, LTD. (printing machinery manufacturers, etc., London)—Satisfaction in full on July 31st, 1923, of second debenture dated January 4th, 1922, securing £3,492 3s. 10d.

FERRESTONE PRESS, LTD. (London).—Issue on July 17th, 1923, of £4,000 debentures, part of a series already registered.

KEALEYS, LTD. (printers, stationers, etc., London)—Particulars filed of £1,000 debentures authorised by resolutions of July 17th and 25th, 1923, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £700.

DARBY'S (PRINTERS), LTD. (Wimbledon).—Particulars filed of £1,500 debentures authorised July 23rd, 1923, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

JAKEMAN AND CO. (PRINTERS), LTD. (Hereford).—Particulars filed of £500 debentures authorised July 30th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital and ranking *pari passu* with £1,500 prior debentures, the whole amount being now issued.

BRENTWOOD GAZETTE PRINTING CO., LTD.—Mortgage dated July 21st, 1923, to secure £400, charged on 16, St. Thomas's-road, Brentwood. Holder: Miss M. Salt, Gipping, Burland-road, Shenfield, Essex.

NUNEATON OBSERVER, LTD. — Particulars filed of £5,000 debentures authorised July 5th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

READING OBSERVER, LTD.—Particulars filed of £6,000 debentures authorised December 22nd, 1922, and covered by trust deed dated July 9th, 1923, charged on 19 and 21, Belagrave-street, Reading, and the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued. Trustees: A. F. Clark, 6, Station-road, Reading; P. H. Palmer, 101, Kings road, Reading; W. C. Bell, The Elms, Emmer Green, Caversham, Reading.

HORACE T. POINTER, LTD. (paper and cardboard manufacturers, New Cross, S.E.).—Particulars filed of £2,000 debentures authorised July 12th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued. Also registered land registry charge constituting a specific charge on 29, Pomeroy-street, New Cross, S.E., of even date, to secure £2,000 as collateral security to above debentures. Holder: G. H. Wilkinson, 66, Upper Thames-street, E.C.

NEWS AND BOOKS SUPPLY, LTD. (London).—Mortgage on 6, Cameron-road, Ilford, and goodwill of business, etc., dated July 11th, 1923, to secure £1,225. Holders: Reformatory and Refuge Union (Incorporated), 117, Victoria street, Westminster.

JAMES CROPPER AND CO., LTD. (paper-makers, etc., Burnside, near Kendal).—Particulars filed of £15,000 debentures authorised May 24th, 1923, charged on the company's undertaking and property, present and future, the whole amount being now issued.

ANGLO-CANADIAN WAX PAPER CO., LTD. (London).—Satisfaction in full on July 31st, 1923, of debenture dated March 3rd, 1922, securing all moneys due or to become due from company to Lloyds Bank, Ltd.

BANKRUPTCIES, etc.

THE LEADER PUBLISHING CO., LTD.—The first meetings of the creditors and shareholders of the Leader Publishing Co., Ltd., 367, Strand, W.C., were held on August 14th, at the Board of Trade Offices, Carey-street, W.C., when accounts were submitted showing liabilities £1,532 expected to rank, against net assets valued at £328, after deducting £1,100 in respect of debentures. The paid-up capital was returned at £1,000, and the account with the contributories disclosed a deficiency of £2,203. Mr. E. T. A. Phillips, official receiver, reported that the company was formed in October, 1922, to acquire a business carried on by Mr. Frederick Reader, and to trade as publishers of sporting periodicals and promoters of sporting competitions, etc. The failure of the company was attributed to the cost of publishing and distributing the *Racing and Football Leader* having exceeded anticipations and to the inability of the company to obtain advertisements. In the opinion of the official receiver the failure was also due to insufficiency of working capital. The liquidation was left in the hands of the official receiver.

Paper Agents' Affairs.

A general meeting of creditors was held recently at the London Bankruptcy Court under the failure of Godfrey Isaacs and Michael Levy, trading as George Harrison, paper agents, 32, Queen Victoria-street, E.C. The statement of affairs presented by the debtors showed liabilities £50,550. The official receiver reported that the debtors had submitted a proposal for the payment of a cash composition of 5s. in the £. The terms appeared to be reasonable and calculated to benefit the general body of creditors.

According to the debtors' statements Godfrey Isaacs commenced business on his own account in November, 1912, as a paper merchant, at 31, Eastcheap, E.C., under the style of "George Harrison." The debtor, Michael Levy, joined the firm in November, 1913, and they traded in co-partnership under the same style; the business was very successful until the end of 1920, when, in consequence of the slump in trade and their inability to recover their book debts, they were compelled to pledge their stock with their bankers in order to carry on the business. In July, 1922, they registered "George Harrison (Agencies), Ltd.," with a nominal capital of £4,000, to carry on business as paper merchants and agents; both debtors were appointed directors at a salary of £750 per annum, which position they held at the date of the receiving order.

DERBY District Committee of the Joint Industrial Council announces a half-day excursion to Matlock Bath on Saturday, September 1st. A Venetian Fair and Carnival is only one of many attractions offered to participants.

Warrillows, Ltd.

Meetings of Creditors and Shareholders Ordered.

It was announced in Friday night's *London Gazette* that the Court has directed that separate meetings of the unsecured creditors of Warrillows, Ltd. (other than those whose debts are preferential or do not exceed £5), the preference shareholders and the ordinary shareholders be convened for the purpose of considering a scheme of arrangement.

The meetings will be held at Winchester House on August 23rd at 11.30 a.m., 2 p.m. and 3 p.m. respectively.

Proposed Scheme of Reconstruction.

The directors of Warrillows, Ltd., announce that a scheme has been evolved which has been accepted by the secured creditors of the company, and which the board recommend as the only means of avoiding liquidation and saving something for the unsecured creditors and shareholders.

The directors, in a circular addressed to the shareholders, state that the London Joint City and Midland Bank has a first charge on the land, buildings and fixed plant and 440,000 De la Rue shares. It is proposed to create 5 per cent. first mortgage debenture stock for £210,000, to mature in 1933, but redemption will in the meantime proceed by the application of 75 per cent. of the net profits after charging interest on the debenture stock and the income debenture stock to be issued. The whole of this debenture stock will be deposited with the Midland Bank as collateral security for its existing claim up to the amount of £150,000, in respect of which sum of £150,000 the Midland Bank shall retain its existing charge. If at the end of the third or any subsequent half-year there shall have been a trading loss, or if it appears that the stock in trade and the debtors treated as good have together fallen below the sum of £75,000, the Midland Bank shall have the right to call for immediate payment of all moneys secured collaterally by the first mortgage debenture stock.

In respect of the balance of the Midland Bank's claim, namely, £195,236, it is proposed to issue a like amount of income debenture stock, while the bank shall be entitled to retain the 440,000 De la Rue shares, and to realise them as it thinks fit.

In addition to the income stock to be issued to the bank, there will be issued, in satisfaction of the claims of trade and other creditors (other than those under £5, which will be paid in cash in full), income debenture stock which may approximately be stated to be £380,000 in all. No dividends will be paid while any of the first mortgage debenture stock and the income debenture stock remains undischarged.

The preference shares will be reduced to 10s. per share and the ordinary shares to 1s. per share. To facilitate the reorganistion the preference shareholders shall surrender their participating and cumulative rights and claims to arrears of dividends, but their dividend shall be increased from 7½ per cent. to 10 per cent., and in the event of liquidation shall be entitled to rank for 20s. per share in priority to ordinary shareholders.

Benn Brothers, Limited.

At the annual meeting of Messrs. Benn Brothers, Ltd., publishers of 8, Bouverie-street, E.C.4, held at the offices on Friday last the accounts and report were approved, with confirmation of the proposed dividend of 17½ per cent., less tax, for the year. The accounts for the twelve months to June 30th last showed a net profit (after allowing for the directors' percentage of the earnings) amounting to £25,435, as compared with £16,809 for the previous year, and £10,000, as against £4,000 a year ago, is put to reserve. The larger profits earned were attributed to the successful development of the company's books department, there having been, owing to the higher printing costs, a shrinkage in the net revenue derived from trade papers and periodicals. The business of periodicals and books has been separated, for which purpose a subsidiary company under the title of Ernest Benn, Ltd., has been formed. This, it is understood, is purely in the interests of organisation. An addition of £7,565 to capital account represents the amount of shares further allotted to members of the staff. While the general reserve has now been brought up to £22,375, the position on trading and other account has been improved slightly, debtors exceeding creditors by £33,315, which is a betterment of £6,121 on the year. The item of goodwill and copyrights has been lowered by £10,000, to £71,545, and the cash holding reduced from £29,526 to £17,801, but there has been a considerable increase in investments. Last year the latter figured at £5,786. There are now British Government securities, taken into the balance sheet at under cost, totalling £24,273, and, in addition, shares in subsidiary and other companies to the amount of £27,515.

Sir Ernest J. P. Benn, who presided at the meeting, said in the course of his speech, that a great deal of progress was being made both at home and abroad in the art of printing and the processes of reproduction. Since the days when his father, the founder of the business, published in 1880 the first Meisenbach block to appear in a trade paper, Benn Brothers, Ltd., had always led the way in illustrated journalism and artistic reproduction. Their art books had given them opportunities to develop in this connection, and it was literally true to say that during the last year they had ransacked the world's markets for new ideas and new processes. In that way they were doing their share to set a new standard in publishing.

Check to Paper Statistics.

According to the *Paper Mill*, N.Y., the Federal Trade Commissioner at Washington announces that Congress had neglected to appropriate sufficient funds for the work of collecting and distributing statistics on the production, shipment, importation and exportation of paper and pulp. The work would accordingly discontinue from the week ending June 30th. Our contemporary urgently suggests that the American Paper and Pulp Association undertake the task of compiling the figures.

From the London Gazette.

PARTNERSHIP DISSOLVED.

THE FUTURE OF SOUTH AFRICA

THE strong development and progress shown by South Africa, even during the depression of 1922, indicates in no uncertain fashion the measure of prosperity that country will enjoy in more normal times.

The trade outlook for the Union of South Africa in 1923 is extremely encouraging at the present moment, and the attitude of all in that wonderful country—from the Premier (The Hon. Gen. Smuts) down to the smallest Printer—is one of well-founded optimism.

Supply houses catering to the Allied Trades anxious to develop the South African market will be sent a post-free copy of

THE SOUTH AFRICAN PRINTER AND STATIONER

Trade Examination Successes.

Liverpool City School of Art.

Awards have been made in respect of examinations held at the School of Art, Hope-street, Liverpool, on May 3rd and 4th last, arranged by the Printing and Allied Trades Advisory Committee of the Liverpool Education Committee. The following are the results:—

Typography (Composition: theoretical practical).—Victor Gill, 1 guinea; A. Thewlis, scholarship value 31s. 6d. Lithography (practical): Sydney Thompson, 1 guinea; T. Williams, scholarship. Bookbinding (forwarding): A. Harper and W. Broughton, 1 guinea each. Bookbinding (finishing): S. R. Brooks, scholarship. Photo-mechanical process: Ernest Williams, 1 guinea; and W. G. Fazakerley, scholarship.

Forty candidates presented themselves for examination. The money prizes were contributed by the Liverpool Master Printers and Allied Trades Association, and the scholarships were granted by the Liverpool Education Committee. In addition sums of 21s. and 10s. 6d. given annually by Messrs. L. S. Dixon and Co., Ltd., were awarded to H. Fairbairn and L. G. Soley respectively for the best letterpress display title page in two colours.

The work of the Advisory Committee, which consists of two employers and four employees' representatives, was directed last session to considering the nature and condition of the school equipment, and reporting upon its adaptability to modern requirements, the present syllabus and its revision to suit current local necessities, and the efficiency of the existing training methods, with the object of making recommendations thereon to the Liverpool Education Committee.

An Up-to-date Equipment.

The outcome of these recommendations is that additions are now being made to the school equipment of a new Waite and Saville's offset rotary litho machine, a new No. 4 model linotype, and of accessories to the letterpress, lithographic, binding, and photo-mechanical process departments, which will considerably enhance the value of the school for the training of apprentices and young students, and also afford facilities for men to acquire a knowledge of litho rotary printing and mechanical composing which in small printing establishments it is now impossible to obtain.

It is hoped that this endeavour to bring the equipment and training of the school up to present-day requirements will meet with the support of parents and guardians and of employers and trade unions affected, and that they will further the opportunity afforded for securing the desirable experience of a training supplementary to that obtained under workshop conditions.

The development of the school's resources synchronises with the movement for obtaining the co-operation of employers and employed in jointly selecting only those boys whose elementary education, aptitude and physique qualify them for apprenticeship, and to secure for them when in employment a progressive training by means of occasional examination of the boys and advisory suggestions to the employer.

Irish Paper Industry.

Swift Brook Mills Not Closed.

Alarmist reports have appeared in certain Irish newspapers concerning the condition of the paper industry in that country. One statement was that the Swift Brook Paper Mills, Saggart, Co. Dublin, had closed down owing to depression in trade.

We are informed by Messrs. John McDonnel and Co., Ltd., the owners of the mills, that the works have not been closed down. They have, in fact, been making some extensive alterations, including the erection of a new power house, and the taking out of old steam engines and installing new electric motors. This has caused a certain amount of interruption in the regular running of the mills, but that is all.

Messrs McDonnel add: "We are glad to say that we do not anticipate any further interruption, and will be glad if you will contradict the report that we are closed down."

An Historic Printery Site.

Story of Printing House-Square.

The City Corporation has fixed a plaque on the wall of Printing House-square bearing the following inscription:—

Site of the
Blackfriars
Playhouses
1576–1584
1596–1655.

The first important building on the site now occupied by the offices of *The Times*—it is stated in an article in that journal—was the Blackfriars Monastery, founded in the last quarter of the thirteenth century. King Edward II. stayed here early in the fourteenth century and held a Parliament on the spot. Another Parliament, known as the Black Parliament, was held here by King Henry VIII. in 1523, and the divorce trial of Katherine of Aragon took place in the Great Hall.

On the dissolution of the monasteries the conventual buildings were sold or leased in portions. Among the buildings which took the place of the monastery in Queen Elizabeth's reign was a "private" (roofed-over) theatre, the Blackfriars Playhouse. When Burbage constructed the theatre the inhabitants of Blackfriars objected to its use as a playhouse, and as a result it was leased to the "Queen's Children of the Chapel." Here the "children" performed plays and music. Later Shakespeare's company bought them out, and used the building as one of its regular playhouses. This was in 1608 or 1609, by which time Shakespeare had ceased to be an actor. Here were acted the works of great Elizabethan dramatists—Ben Jonson, Marston, Fletcher, Massinger, and probably of Shakespeare himself. The theatre has hitherto been commemorated in the name of Playhouse-yard, just north of Printing House-square, which is occupied by the publishing offices of *The Times*.

The Great Fire of London devastated the Blackfriars region in 1666, and a year later there was built on this spot the King's Printing House, whence Printing House-square takes its name. In the new Printing House John Bill, the King's Printer, printed the *London Gazette*, which was the only paper in England for thirteen years. The King's printers moved to another place of business in 1770.

For fourteen years the Printing House remained unoccupied, and in 1784 it was taken by the first John Walter, founder of *The Times*. Here, on January 1, 1785, appeared the first number of the *Daily Universal Register*. Three years later the title of the paper was changed to *The Times*, and this journal has been printed on the same spot ever since.

Halfpenny Postage Restriction.

Traders have for some time been inconvenienced by the limited availability of the halfpenny rate for invoices, statements, and printed matter—writes a correspondent of the *Manchester Guardian* (Commercial). In most towns the rate is only applicable to matter posted earlier than about 4 p.m. (in Manchester, for instance, the time is 4.15 p.m.). Before the war, when many firms worked until 8 or 9 p.m., invoices posted up to the latter time usually reached their destination next morning. Nowadays the bulk of this matter is posted by 5.30 p.m.

A request has recently been made to traders by the Manchester Post Office that letters should be made up in packages, with all addresses uppermost, instead of being posted loosely or in bags. If this is done a great deal of extra work will be thrown on to the staffs of the various firms. The writer has tried the system for a night or two, and finds that—especially on statement days—it involves increased assistance for an hour or two each night. At the same time, the task of the postal officials is appreciably lightened.

I do not think traders generally would object to the extra work if they received something in exchange. The Post office might extend the hours for posting halfpenny matter by, say, one hour. This would allow for the greater ease of dealing with matter made up in packages, and would give considerable relief to most firms. Thus, the Manchester head office's time for posting such matter would be 5.15 p.m. and the Newton-street time 5.30 p.m. I believe the Manchester firms, for this concession, would allow the extra time to be given by their own staffs for the preparation of the mails.

"Daily Telegraph" Paper Mills.

The greatest enthusiasm was displayed on the occasion of the first annual meeting of the *Daily Telegraph* Paper Mill Sports Club which was held at the Mill Sports Field, Burnham Park, on August 7th. The gathering was graced by the presence of Lord and Lady Burnham. The hon. president of the club is Col. F. E. Lawson, D.S.O., M.C., and the president Mr. Philip T. Goldney. During the latter's association with the management or the mills he has identified himself with considerable interest and spirit with the social welfare of the employees, and when it was suggested a sports meeting should be held he displayed that remarkable energy which he possesses to make it a success, and it was truly a big success. The weather conditions were ideal; Burnham Park provides excellent facilities for the recreation of the employees of the *Daily Telegraph* Paper Mills, bowls, cricket and other games being in full swing during the summer season.

The following were the officials: Referees, Chas Higgens and W. J. Starkie; judges, Gerald Watson, G. Buchanan, H. Burcham Hart and W. C. Warrell; timekeeper, R. Michie; hon. secretary, E. J. Clarke; hon. treasurer, W. H. Evans; clerk of course, T. Pickup; starters, W. H. Evans and P. H. Selves; telegraph stewards, F. Miller and R. Digby; Grounds Committee, — Stapley (chairman), Clifton, Denyer Jun., Hooker, R. A. Jenkins, R. H. Jenkins, Keep, Lambkin, Pickup, Toone, Wiggins, H. White; chairman Sports Committee, W. E. Bentley.

Lady Burnham, who was presented with a handsome bouquet by Miss Goldney, presented the prizes, and some interesting speeches followed. The prizes were well selected, useful and valuable, and were contributed to by several trade friends.

The Dartford United Silver Band was in attendance during the day, and in the evening there was dancing to the music of the *Daily Telegraph* Paper Mill string orchestra.

Paper Prices Unsatisfactory.

The situation on the paper market is still anything but satisfactory in one respect, namely that the prices are extremely low, especially in view of the rise in the costs of production which has taken place during the past few months. In several countries, moreover, many paper mills are beginning to complain of the scanty supply of orders, so that it has been necessary to make a number of restructions in output. It is the consumption of fine papers and wrappings, in particular, on the European markets that has been diminished, while the demand for export is still fairly good. The news-print mills are usually working full time; and there is a steady demand for news-print, especially from the United States.—*Swedish Export.*

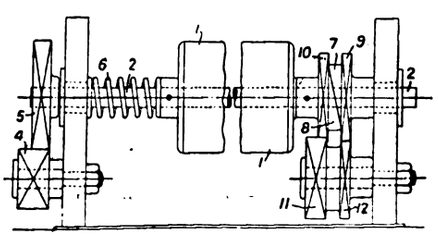
New Inventions

Sheet Delivery.

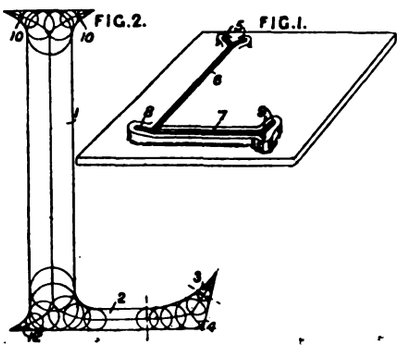


In a sheet delivery mechanism for printing machines comprising a chain delivery co acting with another sheet carrier such as a transfer cylinder, etc., mechanism is provided on one of the carriers, to steady the other carrier or each carrier at the time the sheet is being transferred from one to the other. The arrangement shown comprises a transfer cylinder 5 from which sheets are transferred to delivery chains 11 driven in unison by the gears 7, 8. The cylinder 5 carries grippers 19 co-acting with a cross bar 21, and the chain grippers 22 are mounted on a spring tensioned rock shaft 23 journalled in a bearing 24

together with a cross-rod 26 carrying lugs 25 co-acting with the grippers 22. Said bearing 24 is carried by a flat plate 27 adjustably secured by pins 28, 29 to the chain 11, and opposite the flat plate 27 a barrel 15 is secured on the transfer cylinder 5, the barrel containing a plunger 16 under the influence of a coil spring 18. When the chain grippers 22 are opened to take the printed sheet from the cylinder grippers 19, the spring plunger 16 contacts with the flat plate 27 and forces the adjacent links of the chain 11 firmly against the bottom of the teeth 12 of the sprocket wheel 10, thus steadying the chain grippers against vibration as they close on the sheet and preventing tearing of its edge. The invention is patented by the Harris Automatic Press Co.

Ink Distribution.

An ink distributing roller of a printing machine or a coating roller in a coating machine is reciprocated longitudinally by means of two co-acting face cams in continuous contact and rotated by gearing at different

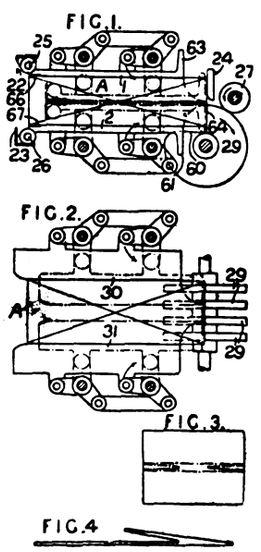


speeds. As shown, the cams 7, 8 are carried by loose and fast gears 9, 10 on the shaft 2 of the roller 1 and are held in contact by a spring 6. Gears 11, 12 transmit the drive from the gear 10 to the gear 9, the shaft 2 being driven by gears 4, 5. The invention is patented by Mr. H. W. V. Wilson and the Victory-Kidder Printing Machine Co., Ltd.

Stereotype Matrices.

A method of preparing a stereotype matrix, as patented by Mr. F. W. Wirth and others, consists in coating by spraying, painting, etc., the impression side of the ordinary flong with a liquid containing a heat-insulating medium such as borax and ammonium sulphate and a fermentation preventing medium such as carbolic acid, coating the back of the flong with paste to which fermentation preventing medium is preferably added, applying to the paste layer a covering sheet of unsized paper or other material impenetrable to the paste, placing the flong on the forme and subjecting it to heat and pressure to impress and dry the matrix. A suitable liquid for applying to the flong is composed of 1 kilogramme of water, 50 grammes of ammonium sulphate, 15 grammes of borax, 20 grammes of boric acid and 3 grammes of carbolic acid, the paste being preferably matrix paste with the addition of dextrin.

Engraving Machines.



In engraving machines, particularly adapted for copying letters, figures, etc., on metal, wood, stone, etc., of the pantograph or other type, as patented by Messrs. A. Taylor and E. Backhouse, a conical cutting tool is used in combination with a linear pattern of variable contour, so that movement of the tracer over the pattern causes the cutter to cut a groove varying in breadth and depth with, or reversely with, the contour variations of the linear pattern. Fig. 1 shows the pattern

for producing the form of letter L shown in Fig. 2, the part 7 of the pattern to produce the narrower and shallower limb 2 being raised higher than the part 6 to produce the wide and deep limb 1, whilst the serifs 10, 12, 3, 4 are produced by ascending portions 5, 8, 9 on the pattern.

Making Paper Bags.

An invention that relates to apparatus for flattening paper bags of angular cross-section after manufacture has been patented by the Hesser Machinenfabrik Akt. Ges. The bag A

is placed between plates 1, 2 and creasing blades 30, 31 with the closed end against a fixed abutment 24 and a recess 64 in a sectional drum 29. Members 22, 23 are rotated about shafts 25, 26 to clip the open end of the bag against recesses 66, 67. The plates 1, 2 and the blades 30, 31 are swung inwards and rearwards to the positions shown in broken lines in Figs. 1 and 2 respectively, causing the bag A to assume the cross-section shown in broken lines in Fig. 3. Pressing plates 63, 61, on the plates 1, 2 respectively, flatten the bottom portion of the bag against the abutment 24 and recess 64, the plate 61 being slotted to pass between the sections of the drum 29. The drum 29 rotates and the rear edge 60 of the recess carries the lower flattened portion of the end upwards so that it is caught between the circular portion of the drum 29 and a drum 27, thus effecting a further flattening and feeding the bag out of the machine, the members 22, 23 meanwhile having been released. The completed bag is shown in side elevation in Fig. 4.

De-Inking Processes.

Two Recent British Patents.

Investigations into the treatment of waste papers are proceeding vigorously, and two recent British patents have been taken out in relation to this matter.

According to one method of an invention by Mr. Adolph L. Burlin, the waste paper (freed from dust) is introduced into a Hollander, breaker, or some other suitable mill or beater, provided with a washing drum or steam pipe, and the waste is thoroughly broken up or reduced to pulp therein. A small quantity of soda ash (Na_2CO_3) is then added, and the mass agitated for about ten minutes with the necessary quantity of water, the temperature being raised by a circulation of steam, from the steam pipe or by other means to about 35 degs. C., after which a solution of oxalic acid ($C_2H_2O_4$) is added, and the mass is again agitated and allowed to soak and expand, until the paper is thoroughly treated. The mass is then washed to clean it of the foreign matter dissolved or expelled by the treatment. This treatment is continued until the desired effect is attained. The period of chemical treatment usually varies from a quarter of an hour to an hour, or sometimes longer, and the effect can be readily observed from time to time. If a very white final product is required, a small quantity of bleaching substance may be added after the washing treatment, and the mass agitated in luke-warm condition for a short period, say about ten minutes. For the treatment of ordinary news-print, the inventor has found that 8 lbs. of soda ash and 2 lbs. of oxalic acid will suffice for the treatment of 5 cwts. of material.

Instead of performing the operations in a single beater with special appliances, the material may be reduced in an ordinary beater, and then withdrawn to a second vessel for subsequent treatment.

In a process patented by Mr. Paul Bourcet and Mr. Henri Regnault, the printed paper is pulped up with 20 per cent. of its weight of hot water, brought to a temperature of 50 to 100 degs. C., and 1 to 2 per cent. of its weight of a mixture of equal parts of oleic acid and sulphoricinate of soda. In the course of this operation the liquid and soluble elements of the printing ink enter into solution, and also the pigments, which the ink contains, become separated in the pulp thus obtained. The operation is complete in about one hour, and at this moment there is added to the pulp volatile carbide or hydrocarbon in weight equal to that of the paper operated upon. The mass is intimately mixed so that the liquid completely absorbs the carbon and the pigments, separated in the pulp, and there is then added to the whole tepid water, the mass being agitated the while. The quantity of tepid water added is such that the cellulose shall be in suspension in the proportion of about 2 per cent. The liquid which contains the cellulose in suspension is subjected to the action of a centrifugal filter. The hydrocarbon may be recovered by distillation, as well as the pigments which it has absorbed.

THE late Mr. George Develly Robey (71), of Purley, Surrey, and of Fenchurch-street, E.C., manufacturing stationer, of Messrs. Worrall and Robey, Limited, left £17,750 (net personalty, £17,311).

Australian Market for Printings.

Further Interesting Comparisons.

The total imports of flat news into the Australian Commonwealth, during 1921-22, were 2,749 tons to the value of £81,955, as compared with 5,282 tons, to the value of £305,354, in 1920-21. The quantities and values of the imports from the various exporting countries were as follows, the figures in parenthesis representing the quantities and values during 1920-21:—United Kingdom, 439 tons, £21,745 (970 tons, £94,665); Canada, 351 tons, £8,962 (996 tons, £35,551); Newfoundland, nil (42 tons, £2,595); Belgium, 26 tons, £618 (5 tons, £421); Finland, 18 tons, £439, (270 tons, £15,816); Japan, 36 tons, £1,413 (18 tons, £524); Netherlands, —, £9, (7 tons, £381); Norway, 827 tons, £21,081, (977 tons, £50,996); Sweden, 1,052 tons, £27,634 (1,676 tons, £65,787); U.S.A., —, £54 (321 tons, £38,618).

The quantities and values imported into the various Commonwealth States were as follows, the figures for the previous year being shown as above:—New South Wales, 1,232 tons, £35,752 (3,229 tons, £206,098); Victoria, 1,060 tons, £32,159 (1,274 tons, £55,444); Queensland, 228 tons, £7,744 (401 tons, £13,905); South Australia, 109 tons, £2,658 (132 tons, £9,534), Western Australia, 107 tons, £3,198 (222 tons, £17,700); Tasmania, 13 tons, £444 (24 tons, £2,673).

The total imports of printings (other kinds) during 1921-22 were 10,717 tons of the value of £402,358. During the previous year 11,748 tons were imported to the value of £1,036,728. The figures for the various exporting countries are given below, together with those of the previous year:—United Kingdom, 394 tons, £275,549 (5,668 tons, £557,490); Canada, 904 tons, £32,505 (250 tons, £6,795); Ceylon, 3 tons, £116 (nil); New Zealand, 1 ton, £85 (nil); Belgium, 190 tons, £7,254 (243 tons, £22,372); Finland, 43 tons, £1,183 (32 tons, £1,385); France, £10 (nil); Japan, nil (9 tons, £417); Netherlands, 42 tons, £1,319 (22 tons, £1,679); Norway, 1,350 tons, £43,552 (2,075 tons, £126,606); Russia, nil (5 tons, £201); Sweden, 393 tons, £14,152 (482 tons, £52,469); U.S.A, 397 tons, £26,633 (2,962 tons, £267,314).

The figures for the individual States were as follows:—New South Wales, 3,018 tons, £140,898 (4,918 tons, £437,588); Victoria, 6,209 tons, £199,061 (4,865 tons, £433,681); Queensland, 821 tons, £35,466 (1,139 tons, £91,540); South Australia, 395 tons, £16,751 (437 tons, £37,633); Western Australia, 263 tons, £9,591 (356 tons, £35,965); Tasmania, 11 tons, £591 (3 tons, £321).

Paper Imports for the Six Months Ending December, 1922.

The total arrivals of paper and stationery from all countries into the Australian Commonwealth during the six months ended December 31st, 1922, amounted in value to £3,176,527. This figure compares with £2,462,673, the total value of the same class of merchandise entering the Commonwealth during the corresponding period of the preceding year. Of the various countries sending paper and stationery to the Australian market during the six months ending December, Great Britain's contribution—£1,784,592—places the Mother Country a good first on the list. The order of the other countries supplying paper is as follows: Canada, £416,767; United States, £337,047; Japan, £15,978, and Germany, £9,470.

The following table shows the countries of origin and the comparative percentages of the value of the paper and stationery imports for the respective six-monthly periods ending December, 1922 and 1921:—

Country.	1922.	1921.
United Kingdom ...	56·1	48·7
Canada	13·1	16·9
United States ...	10·6	10 3
Japan...	·5	·4
Germany	·2	—*
Other countries ...	18·9	23·6

* Prior to August, 1922, the importation of German goods was prohibited.

A POSTCARD containing an aerial view of the Hele Paper Mills of Wiggins, Teape and Co. (1919), Ltd., informs us that the postal address is now "Devon Valley Mill, Hele, Bradninch, Devon."

Overseas Markets.

January to June Values Compared with the Corresponding Period of 1922.

Some interesting calculations are published in the *Board of Trade Journal* showing the declared values of imports and exports during the first half of the year compared with a similar period last year The calculations represent the value which would be put upon imports and exports in the mass if each item had the same average value per unit of quantity as was declared for goods of the same description in 1922. In this way, aggregate figures are obtained, the comparison of which, with the corresponding figures for 1922, enable the extent of the influence of price-changes and the aggregate changes in the volume of goods imported and exported to be estimated. The figures are in thousands of pounds.

Taking paper and cardboard imports, the declared value of these for the first 6 months of last year is shown to be 5,340, as against 6,183 during January to June of the present year, while the value in 1923 estimated at the average values of 1922 are represented to be 6,642. Index numbers are given for 1923 compared with 1922 where 1922 equals 100, and on this basis it is indicated that the average value of paper imports this year stood 93·0, and the quantity at 126·4.

Imports retained are dealt with in a similar manner. The declared value in the first half of last year is given as 5,203, as contrasted with 6,022 during January to June. Values in 1923 estimated at the average values prevailing during the first six months last year are put at 6,466. The index numbers for 1923 compared with 1922 are: average value, 93·1; quantity, 124·3.

The statistics dealing with the exports of British paper and cardboard are no less interesting. Under this heading it is shown that the declared value during January to June last year stood at 4,214, as against 2,984 for the corresponding period of the present year, while the values estimated at the average values in 1922 are shown to be 5,816. The index numbers of 1923 compared with 1922 were: average value, 72·5; quantity, 194·9.

Why Some Printers Succeed.

An Inquiry into Business Principles which Lead to Success in the Printing Industry.

"Nothing succeeds like success" says the proverb. And evidently the old saw is borne out in the case of certain well-known businesses which, once set on their feet—and that perhaps takes a lot of doing—thenceforward progress by leaps and bounds, and appear, as it were by an inherent principle of good fortune, to achieve ever-increasing heights of success. No doubt much of the secret of this is to be found in the word "confidence." There is nothing like confidence in oneself and in one's business to give one the energy, the imagination and the enterprise which are the best guarantors of progress. And a small amount of success achieved not only heartens the ambitious printer himself, but also gives confidence to his business friends and connections and so eases the further course of trade.

The proverb, however, does not take us very far. It holds out a promise that every item of success achieved is likely to aid us to still greater progress, but it gives no indication of the business principles which experience proves to be best to follow in endeavouring to place a business on a firm and lasting foundation. Some interesting particulars in this connection have been put together by Mr. Frank H. Williams who, writing in the *American Printer*, hands on to the trade some pointers worth the thought of printers in this country. He puts his observations into the mouth of a successful printer of the Middle Western States, which printer soliloquises thus:—

There's plenty of data and statistics available telling why printers fail, but there are mighty few statistics to be found as to why printers succeed. And yet, while it is of course important to a printer to know the reasons why other printers fail to make good, it would certainly be many more times valuable to the average printer to know just what it is that has enabled other printers to put their businesses across to big successes. I've had this thought in mind for some time and have done some digging into available reports trying to find out success reasons among printers. But this digging into books hasn't brought me the worth-while results that have come from investigating such successful printers as I bump into from time to time, here at home and in other cities when I go out of town on trips. Altogether I have recently investigated the reasons why twenty very successful printers have put their businesses across and made money.

The Question of Capital.

Among the twenty I didn't find a single printer who attributed his success to adequate capital. And yet the lack of adequate capital is blamed by the failure statistics for the failures of a big percentage of all printers who don't make good. In other words, the fact that a printer hasn't sufficient capital needn't keep him from making a success if he has the other qualifications for putting his business over.

In fact among these twenty printers I actually found twelve who declared that they had constant battles during their early careers to get enough money with which to carry on their businesses. They triumphed in spite of these capital handicaps. And surely their successes and the successes of so many other printers who have gone ahead in spite of a lack of money should serve as an inspiration to all other aspiring printers.

Honest Work.

Among the twenty printers I found that there was a pretty thorough consensus of opinion that one of the biggest reasons for success is keeping everlastingly at the job.

"I've been on the job twelve and fourteen and even sixteen hours a day ever since I started in business," said one printer who has built up a splendid business. "I've done everything around this plant that there is to be done. And I'm still doing it. Personally I don't see how a printer can expect to build up a really big, really outstanding business success unless he is willing and able to stick on the job all the time." This one printer's example is, perhaps, considerably too strenuous for the average printer to follow. But, surely, what he says is something for every printer to ponder.

Avoid Scattered Fire.

Another interesting success-reason I found in my investigation among these twenty printers was that every one of them had spent his entire life in the printing business!

There wasn't a single printer among the lot who had come into the printing business from some outside occupation. In other words, experience is a tremendous factor in making a print shop a success.

And here too, there should be cause for inspiration among those printers who are devoting years to the printing business, and who are gaining in experience with each new year.

The Value of Salesmanship.

Selling ability was rated quite high among these twenty printers as an essential to success.

"When I started my print shop," said one of these successes, "I was anything but a good salesman. I hated to go out and mix with people. I was diffident and shy. And I had an idea that I could hire someone to do the 'dirty work' for me, as I called the selling end of the game. But I was soon disillusioned. I found that good printing salesmen didn't grown on trees. I not only found that they were hard to secure, but I also found that top-notch salesmen were generally financially interested in the companies they represented, and couldn't be lured away. So it was up to me to go out and sell printing or go under. I did it. I got busy, and studied salesmanship at night. In the day time I went out and met the trade. I ran my plant in between times. And, finally, I became a good salesman. I've been a success ever since I made myself go out and sell printing."

Printing must be sold. It can't simply be turned out and piled up on shelves and in warehouses. And here, too, there seems to be an important point for other printers to consider.

Keeping Up-to-Date.

Keeping step with the procession was also rated high by many among the twenty printers as an essential to success.

"Style in printing," said one of the successful small-town printers interviewed, "is just as important to business success as style is important in women's wear in putting women's wear manufacturers over the top. This is just as much true in the small town, in my opinion, as it is in the larger cities. It is a mistaken idea to think that the small-town people don't know good, modern printing when they see it. Small-town people are constantly receiving printed matter from the largest cities in the country. They are familiar with new type faces and new methods of make-up, even if they don't know the type names or other technical terms connected with printing. And the local printer who can keep up with the trend of the times, and turn out printing of which his customers will be proud, is the printer who gets the business, in my opinion."

Keeping Promises.

"Keeping promises" was also held by a goodly number of the printers to be a fundamental rule for success in the printing business.

"Our slogan," said one of the biggest of the printers interviewed, "is simply 'Prompt Printers.' We live up to this slogan. We are prompt. And we also keep our promises. In the early days of our career we did what so many printers do. We failed to keep our promises, and we put customers off with one excuse and another from day to day. Finally we found that many of our best customers were going elsewhere. Of course we looked into the reasons for losing these customers, and we found that it was our policy of not

THE [illegible] CUTTER AND CREASER

Specially designed for the accurate cutting and creasing of carton work at high speed.

SPECIAL FEATURES

Built on similar lines to the Miehle Press, and all the desirable features of the latter, ensuring dead register, smoothness of working, etc., are incorporated in it.

The tympan or cutting plate on the cylinder is held at the front and rear edges by special locating and clamping devices.

The cards are fed to the front lays in the usual manner, and are then taken by the cylinder grippers at the front edge of the tympan plate with a small amount of over-lapping gripper edge.

The cylinder with the card around the tympan plates comes into contact with the forme in the same way as on the two-revolution printing machine.

The card is taken directly off the cylinder by a special gripper delivery mechanism.

Delivery grippers and pads are adjustable.

An endless band travelling at the same surface speed as the cylinder extends from the point of take-off to beyond the point of release of the delivery grippers.

Another endless band on the delivery carriage receives the card from the first endless band.

The card is transferred from the first to the second endless band at the commencement of the outward stroke of the delivery carriage; the second band rolls away from under the card, leaving it to fall directly on to the pile delivery.

The delivered cards are jogged up so that they can be easily stripped.

There are no tapes or sticks in the pile delivery.

From the point of take-off from the cylinder until the card is deposited on the pile it is supported by endless bands.

It is easily handled, and requires no special knowledge on the part of the operator.

This Cutter and Creaser can, if desired, be supplied with a specially designed pile hoist for raising the cards to the feed board.

being prompt and not keeping our promises. Right away we revised our whole scheme of doing business. We decided to simply not take jobs if we couldn't turn them out when wanted. We made it a rigid rule to live up to our promises. And we adopted the slogan 'Prompt Printers.' Right away we began to recover lost ground. Soon we were actually booming, and we've been going ahead in a very satisfactory manner ever since."

Prices and Quality.

Among all these twenty printers I found that there was a strong feeling that to make a success of the printing business the printer must get the right price for his work. The printer simply can't afford to cut prices simply for the purpose of getting work and keeping his shop running, according to the opinion of these men who have made successes of the printing business.

Perhaps other printers would be more successful in their businesses if they, also, refused to take work at cut prices.

There was, too, of course a strong feeling that quality work must be turned out. Several printers commented forcefully on the bad results to their own business when slipshod work was inadvertently allowed to go through and reach the customer.

Aren't there some worth-while pointers in all this for other printers who want to make successes of their shops?

I found all this to be worth while in helping make more money. And I'm hoping that other printers will find the same thing to be true of all this investigation.

Chas. James Drummond, M.B.E., J.P.

A Remarkable Life Record.

Amongst the veterans of the London printing trade, few can look back upon longer or more varied services than those which Mr. C. J. Drummond has rendered, both as printer and as a citizen of the greatest city in the world.

Though he has lived most of his life in London, Mr. Drummond is not a Londoner by birth, having been born in Ipswich in 1848. It was in Ipswich also that he made his earliest preparations for the battle of life. He was educated in that town at Queen Elizabeth's Grammar School and afterwards served a seven years' apprenticeship at the offices of the *Ipswich Journal*.

In 1869 came the important step of removal to London, where Mr Drummond settled down to a life-work in connection with the printing trade, working at his craft as a compositor, first with Messrs. Cassell and Co. and later with other firms in the Metropolis.

A Trade Union Leader.

In the previous year he had been admitted a member of the Typographical Association—in which Society he still holds a card—and before starting work in London he took the first opportunity of joining the London Society of Compositors, thus taking a step which proved to be of much importance to his later career, for he was destined to play a prominent rôle in the world of trade unionism and industrial problems. He was soon marked out in the L.S.C. as one of the Society's "livest" members, and he was in 1875, so soon as eligible, elected to the Committee of this Society, shortly afterwards being made chairman of the Committee. This was soon followed, in 1878, by his election as assistant secretary of the L.S.C., and three years later he attained to the influential position of secretary of that important trade union. His occupancy of the secretaryship, which continued until 1892, included eleven strenuous and important years of the Society's development. An outstanding feature of the period was the introduction of the Linotype, an event which caused much excitement and some uproar in the trade. But for judicious handling of this matter by the L.S.C., the compositor might not have established his claim to the working of this machine.

On the technical side of the printing industry, Mr. Drummond's name is recorded also as an Honorary Consultative Examiner in Typography for the City and Guilds of London Institute; a founder of the Institute of Printers of the British Empire, and that Institute's vice president and honorary secretary; also president of the Printers' Jobbing Guild.

Industrial Activities.

Mr. Drummond's activities in connection with the L.S.C. extended beyond the boundaries of his own Society, and he eventually

Mr. C. J. Drummond.

became a prominent figure in trade unionism generally. Before accepting the secretaryship of the L.S.C. he had represented the Society as delegate to the Trade Union Congress and became secretary of the Standing Orders Committee. Then in 1883 he was elected vice-president of the Trade Union Congress. Trade unionism will remember him as an outstanding figure in many important movements. Thus it was he who was the author in 1884 of the Fair Wages Resolution, and who in 1889 fathered the clause in the Revenue Act placing trade unions in the same position as friendly societies in respect of the payment of Income Tax.

His prominence in the trade union movement caused Mr. Drummond to attract Government notice, and his services have been requisitioned in connection with various matters of national importance. He was in 1885 made a member of the Royal Commission on Trade Depression, and eight years later he consented, at the request of Mr. Mundella, to serve the Board of Trade as labour correspondent; then in 1908 he was appointed chief labour correspondent to the Board of Trade. He has done a large amount of work also in connection with various Trade Boards, having served as vice chairman of the Tin Box Trade Board, a chairman of the Scottish Board Under the Coal Mines (Minimum Wage) Act, 1912, a member of the chairman's panel under the Arbitration and Conciliation Act, and vice-chairman of the Paper Box Trade Board. He also acted, by appointment of Sir William Harcourt, as Honorary Visitor of Convict Establishments. He has been a member of the Old Age Pension Committee of the L.C.C., also chairman of the local committee for the Borough of Lambeth.

Civic and National Services.

Amongst the many duties performed for his city and country may be mentioned his acting in 1889 as a member of the Mansion House Committee for the Paris Exhibition (for which service he was created by the French Government an Officier d'Academie). In the same year he was appointed by the Crown a Trustee of the City Parochial Foundation, in connection with which he acted as vice-chairman of the Finance and General Purposes Committee, also as chairman of the Pensions Committee. In 1889 he was appointed a member of the Governing Body of the St. Bride Foundation, of which he served as chairman for 16 years. The Cripplegate Foundation is another London centre of educative and recreational activities, of whose governing body he is a member and of which he was chairman for the year 1920-21. He is a member also of the governing body of the Sir John Cass Foundation. And, of course, he is a Liveryman of the Worshipful Company of Stationers.

The war brought to him, as to most, an increase of calls for effort and service, and to his already exacting multitude of labours he added a number of special temporary activities. Amongst these may be recalled his membership of the Prince of Wales' Committee, of the City of London Local Tribunal, of the Civil Liabilities Committee, and of the Local Food Control Committee for the City of London, whilst he was also Sub-Commissioner for trade exemptions under the Ministry of National Service, a member of the Profiteering Appeal Committee for the City of London, and a member of the War Pensions Committee.

Charitable Efforts.

The mention of pensions reminds us that this indefatigable worker has not left charitable and benevolent movements outside his fields of effort. The fact that in 1887 the "Drummond Pension" of £20 per annum for aged printers was established in connection with the Printers' Pension Corporation—to be followed later by a second pension of £20—indicates that quite early in his career his name was prominent in connection with printing trade charities. In the Printers' Pension Corporation he holds no less a position than that of deputy-chairman, and to this he adds membership of the Committee of the Royal Normal College for the Blind, and he is also a life governor of Charing Cross Hospital, and president of the Caxton Convalescent Home, Limpsfield. He is a past Grand Officer in Freemasonry, and secretary of three Lodges, a trustee and chairman of the Friendly Societies Convalescent Homes, past president of the Hearts of Oak Benefit Society, a member of the Manchester Unity of Oddfellows, and of the Ancient Order of Foresters.

But enough of this list of the activities and offices—many of them exacting as well as honourable—with which this veteran of the printing craft has been occupied during his long and distinguished career. Little wonder that he has felt for some time that most of the work in which he has been engaged must now be delegated to younger shoulders, and that the future must hold for him less of strenuous effort and more of rest. His numerous friends in the industry will wish him many years more of health and happiness, so that he may enjoy the retirement which has so well been earned.

The greatest of buildings rise only one brick or one beam at a time.

— SIMPLICITY —

The Keynote of the WINKLER Automatic Feeder.

Simplicity also means efficiency. Simplicity permits quantity production at moderate cost. The WINKLER Feeder, through its simplicity and absence of confusing adjustments has set a new standard of value, combining the utmost efficiency and reliability with a remarkably low price. Standard parts are used exclusively for the construction.

SWISS MANUFACTURE.

SEPARATION of sheets by suction and blast.

Length of printing machine is not increased and access not impaired.

Feeds to register any stock from tissue to board.

Works in unison with the machine, and at any speed up to the maximum guaranteed by the press makers.

Rapid change of jobs, and therefore suitable for short runs.

No tapes or friction wheels, and therefore no marring of colours or setting-off when working colours or backing up.

The blast of air frees the sheet from dust and fluff before it is fed.

Adaptable to any type and size of sheet fed press; if desired, with a Stacking Arrangement.

Trade Notes.

RECEIVING orders under the Bankruptcy Act, 1914, have been made in respect of: W. Armistead, 91-93, Leadenhall-street, London, E.C., journalist; E. C. Kny, lately residing at 2, Holmwood-gardens, London, S.W., but whose present residence or place of business the petitioners are unable to ascertain, journalist.

ON six summonses under the Factory Act, Messrs. Johnson, Riddle and Co. (Limited), colour printers, of Southwark Bridge-road, were last week fined a total of £63. Of this amount, £50 and 10 guineas costs was for failing to fence a goods lift securely.

AT Mansion House Police Court last week, fines and costs amounting to over £7 were inflicted on Mr. W. J. Head trading as the Headley Press, in Fleet-street, in respect of inadvertent non-payment of contributions required under the National Health and Unemployment Acts for a girl clerk in his employ.

"PRINTERS, machine minders and linotypers working at newspaper offices always give me a lot of trouble," said a tax collector at the London Guildhall last week, when Alderman Sir H. de Courcy Moore had before him a big batch of income-tax defaulters. Several committal orders were made.

UNDER the presidency of Lord Riddell, the Printing and Allied Trades Sports Association are forming an Amateur Boxing Club, with affiliation to the A.B.A., with headquarters in the vicinity of the City. Particulars of membership, active and honorary, etc., can be obtained of the hon. secretary, Mr. C. Anderson, 25, Canonbury Park North, London, N.1.

THE Printers' Miniature Bisley will be held on Saturday, September 1st, at the Ham and Petersham Rifle Range. The competitions are open to all *bona fide* members of the printing and allied trades, and over 140 prizes and three trophies are to be fired for. A book containing the programme, entry forms, and other information can be had on receipt of a stamp from the hon. secretary, Mr. A. J. Pescud, 158, Erlanger-road, New Cross, S.E.14.

SUNDERLAND JOBBING GUILD.—Mr. N. H. Patterson, chairman of the Sunderland J.I.C., has presented the Sunderland Jobbing Guild with a silver cup, to be competed for during the autumn session. The competition set is for the best design of a guild card. Mr. Patterson has also offered to print the cards free of charge.

THE death is announced, at Edinburgh, in his 77th year, of Mr. Alexander Ross, who was an employee of Messrs. Thomas Nelson, printers and publishers, Edinburgh, for over 50 years.

THE death occurred on Monday, in his 81st year, of Mr. Edwin Tunstall, for 50 years in the composing room of the *Manchester Guardian*.

THE death has occurred at Liverpool of Mr. Herbert S. Douglas, of the Mersey Stationery Co., Ltd.

THE sudden death occurred on Thursday, at the age of 45, of Mr. William Allan, of Middlesbrough, eldest son of the late William Allan, stationer, of Newcastle-on-Tyne.

A VERDICT of "Death from pneumonia caused by the deceased trying to drown himself in the river" was returned at an inquest on Harry Bilton (64), compositor, of Newmarket.

THE late Mr. Joseph Dewick, of Cannon-street, E.C., and Lewisham, S.E., wholesale stationer, who died July 2nd, aged 77, left £37,570.

PEARSON MEMORIAL FUND.—According to a report of the Arthur Pearson Memorial Fund, which is now closed, from its inauguration in December, 1921, to May, 1923, the receipts totalled £49,886 6s. 11d., of which £48,099 9s. came from donations and organised collections. After the payment of necessary expenses there remained a sum of £28,738 2s. 4d. In New Zealand Mr. Clutha Mackenzie, himself a blinded soldier trained at St. Dunstan's, and son of the late High Commissioner, Sir Thomas Mackenzie, is engaged in raising the sum of £100,000 as a memorial to the late Sir Arthur Pearson, and has already obtained more than half the required amount.

AUGUST 23rd, according to information that reaches us from Christiania, is the date on which pulp and paper mill workers in Norway have decided to come out on strike.

THE majority of the shares in the *Vancouver Daily Province*, which hitherto has been the property of the Lieutenant-Governor of British Columbia, Mr. W. C. Nichol, has been purchased by Messrs. William Southam and Sons, the largest publishers in Canada, who own a chain of newspapers from coast to coast.

THERE commenced publication on Tuesday a free daily newspaper produced in Rangoon, known as the *Burma Exchange Gazette and Daily Advertiser*. It is stated to be similar in contents to any other up-to date newspaper, but in this case the advertisements pay for the paper.

THE Berlin police authorities have suspended for two weeks the publication of the *Deutsche Tageblatt*, owing to its attacks on Dr. Stresemann and the Republican form of Government.

Printing Bogus Banknotes.

United States Secret Service agents seized last week at Long Island a complete plant for manufacturing counterfeit $100 Federal Reserve banknotes. The capture was effected at the precise moment when the counterfeiters were running off the first set of proofs, and the circulation of the notes was thus prevented. The authorities state that this is the second capture within a week of counterfeiters of Federal Reserve banknotes before the notes got into circulation.

According to the chief of the Secret Service, the plates seized in both instances were manufactured in Canada, where a month ago Secret Service agents co-operating with the Dominion Government captured five Frenchmen, together with a complete equipment for turning out $5 and $10 American banknotes. All three plants have been broken up. It is believed that the same gang was responsible in all three instances, the plates being identical in make.

University Degree for Printers.

Particulars of Leeds Course.

The University of Leeds has now issued a prospectus of the newly constituted course for printing students qualifying for the degree of Bachelor of Commerce and a diploma in printing. The following details are given:—

The University has received evidence which seems to establish the need for a prolonged course of training for young men who look forward to occupying posts of directive responsibility in the printing trades. A degree course has therefore been instituted which is designed to meet this need. The students will require to become familiar (1) with the technology of the printing and allied industries; (2) with the principles of Economics and Commerce as applied to modern business.

The course has been made possible by co-operation between the University and the Leeds Education Committee. For the purpose of the scheme the Printing Department of the Leeds Technical School has been affiliated to the University, which will take full responsibility for the students' degree course and examinations. Instruction in all the subjects except printing technology will be given in the University itself.

The degree course will extend over three years, and, at the end of the third year, if he has satisfied the requirements, the student will receive the degree of Bachelor of Commerce. But he is then advised to spend a fourth year in further technological training in Printing at the Technical School, under the care of the School Authorities, in preparation for the Diploma in Printing offered by the School. There he will find ample facilities for the practical and theoretical study of every branch of printing, bookbinding and photographic processes, including the latest methods of photo-lithographic work. During that year he will be entitled to remain a member of the University Union.

The Ordinances and Regulations for the degree in Commerce are given in the Appendix. The full course for the printing student is constituted as follows:—

First Year.—Physics; Mathematics; Economics; Commercial Law. (Attendance is also required at the Printing School for one afternoon—three hours per week).

Second Year.—Engineering; Statistics; Economics; Commercial Law. (Attendance is also required at the Printing School for one afternoon—three hours per week).

Third Year.—Printing; Economics; Accountancy.

Detailed Syllabus.

The following syllabus explains more in detail the nature of the various courses.

ECONOMICS.

First Year.—The evolution of modern economic conditions. Modern industrial, commercial and social organisation. The national income. Value and distribution.

Second Year.—(*a*) Financial and Commercial Organisation.—Business organisation and management; large and small businesses; stock enterprise; the trust movement. Land and water transport. Insurance. Currency and banking; the money market; stock exchange and foreign exchanges. The organisation of foreign trade. (*b*) Labour Organisation.—Methods of remuneration; trade union organisation; conciliation and arbitration; joint industrial councils, works committees, etc. Industrial fatigue. Trades Boards. Factory legislation.

Third Year.—(*a*) Advanced study of principles of economics, with special reference to Public Finance and Administration. (*b*) A special course of study on the Economics of the printing and allied industries. The student will also be required to investigate a selected economic problem relating to this group of industries.

ACCOUNTANCY.

(NOTE.—A knowledge of bookkeeping will be assumed in this course).

(*a*) A general course on Financial Accounts; cost accounts; business administration. (*b*) A special course on the methods of cost accountancy employed in the printing trades.

COMMERCIAL LAW.

First Year.—The Law of Contract; Sale of Goods; Bills of Exchange.

Second Year.—The Law of Partnership; Company Law; Carriage by Land.

MATHEMATICS.

First Year.—The one-year course for Applied Science students, which enables a student to proceed with the applications of Mathematics to Statistics. The course will include a study of Analytical Geometry and the Calculus as far as Trigonometrical Functions and the Exponential.

STATISTICS.

Second Year.—Mathematical Laboratory and Theory of Statistics.

Third Year.—Students will be required, in their third year (as part of the special course on Economics) to become familiar with the sources of statistics and other information relative to the printing and allied trades, and will be trained to evaluate the available statistical material.

PHYSICS.

The first year course prescribed for students taking the degree of Bachelor of Science, *viz.*, Introductory Physics.

ENGINEERING.

The first year course in Engineering prescribed for students taking the degree of B.Sc., *viz.*, General Engineering I.

PRINTING.

(*a*) Practical Composition; (*b*) Mechanical Composition; (*c*) Letterpress Machine Work.

Second Year.—(*a*) Principles of Lithography; (*b*) Preparation of the various printing surfaces used in Lithography; (*c*) Lithographic Machine Work.

Third Year.—(*a*) Bookbinding; (*b*) Illustration Processes; (*c*) Manufacture and Use of Printing Papers; (*d*) Works Organisation and Management; (*e*) General Finance of Printing.

Fourth Year Diploma Course.—(*a*) General Course. Practical work in all sections of the Printing trade; or (*b*) Special Course. Specialised study of one (or two) sections of the Printing trade.

FEES.

The composition fee (including subscription to the University Union) payable for each of the four years of the course will be £45.

Manchester College of Technology.

The prospectus of the forthcoming session of the courses in printing and photographic technology at the Manchester Municipal College of Technology, shows the comprehensive nature of the training offered. The courses commence on October 1st, 1923, and continue until May 9th, 1924. The value of the instruction lies not only in the provision of lectures by experts upon every phase of the activities of the up-to-date printer, but also in the opportunities available for practical work. In this way is the hand trained in conjunction with the mind.

In the composing room there are 36 frames and cabinets, with a supply of type of standard faces. There are three linotype machines and hand presses for proofing. The machine room contains a double demy Miehle machine, a demy Summitt machine, a double crown Wharfedale, Phœnix, Caxton, Golding Jobber, and Arab platens. The lithographic section is equipped with a demy lithographic printing machine, two Mann rotary offset machines, a power demy transfer press, five hand presses, a power plate-graining machine, a collotype hand press and a copper plate press.

The photographic section includes pure photography and the photo-mechanical processes. The studio is equipped for portraiture by artificial light and there is also a dark room, daylight studio, photographic printing room and laboratory. For negative making for the processes of photo-engraving, photo-lithography and offset photo-lithography there is a studio with three dark rooms, which contain one 12 by 10 camera and three 15 by 12 cameras. The dark rooms are arranged for wet collodion sensitising, wet collodion development and dry plate work respectively, and the etching room has the necessary equipment—including two etching machines—for block-making, photo-lithography and collotype. The finishing room is fitted with Royle router, power saw, guillotine and other plant used in the mounting of photographically-engraved blocks. The bindery is fitted for work in forwarding and finishing, and contains a blocking press.

The prospectus, which is admirably arranged, is issued together with "An Outline of the Day Courses held in the Department of Printing and Photographic Technology," both of which handbooks are printed by the Department. The whole get-up is most tasteful and is a striking example of the value of the Department as an instructional centre.

Necrology

Mr. W. H. Thomas.

We regret to record the death, which occurred on Saturday, at his residence in Roman-road, Middlesbrough, of Mr. W. H. Thomas, J.P., principal of the firm of Jordison and Co., Ltd., printers. Mr. Thomas' end came suddenly, as the result of a seizure, and it removes one who was prominent in the printing trade as well as being a public figure in the life of Middlesbrough. He was president of the North-Eastern Master Printers' Alliance, a member of the Executive of the Federation, and a representative of the employers on the Joint Industrial Council. Mr. Thomas was 66 years of age, and a bachelor. At the funeral, which took place on Tuesday, the Federation of Master Printers was regresented by Mr. H. E. Woolston, hon. secretary of the Middlesbrough Association of Master Printers, and the North-Eastern Alliance by Mr. J. English, secretary. Among the wreaths sent was one inscribed "From the President, Vice-president and Members of the Council of the Federation of Master Printers."

Mr. P. J. M'Cullagh.

The death has occurred, at his residence in Dublin, of Mr. Patrick J. M'Cullagh, who for the past 22 years had been travelling representative for Messrs. W. and G. Baird, Ltd., printers, Belfast. Mr. M'Cullagh was formerly Irish representative for Messrs. Marcus Ward and Co., lithographers and art stationers, and later represented Messrs. M'Gowan and Ingram, Ltd. He joined the firm of Messrs. Baird in June, 1901, and had booked some of the largest orders ever given for lithographic work in Ireland. The funeral took place in Dublin on Friday last.

Trade Union Matters.

T.A. AND INTERCHANGE OF TYPE.—At a recent meeting of the Executive Council of the T.A. a report was received from the secretary of the Hull Branch that during one month 42 columns of advertisement matter had been exchanged between two offices, and that at one of the offices an advertisement compositor was under notice. The Council decided to forward to the Master Printers' Federation a request for an immediate conference on the subject of the interchange of such matter.

ELECTION OF T.A. ORGANISER.—There are thirteen nominations for the position of organiser in the Typographical Association, to take the place of Mr. Matthewson, retired.

LEEDS TYPOGRAPHICAL SOCIETY.—The quarterly report of the Leeds branch of the Typographical Association states that the condition of affairs in the local printing trade during the past quarter has remained uniformly bad. The number of unemployed members has varied between 70 and 80, with an inclination to rise rather than fall. In addition there has been an increase of 6,000 hours of short time among the working members, and a reduction of 2,000 hours in the overtime worked. The trade at present is in a state of stagnation, with no appreciable sign of improvement. A feature of the slump is an increasing tendency on the part of employers to put our members on an indefinite suspension for lengthy periods. The Branch Committee are of opinion that such methods of dealing with the present situation are grossly unfair, and an application has been made to the Leeds Master Printers' Association to receive a deputation on the subject.

MANCHESTER Machine Section of the Typographical Association will hold their annual picnic on September 1st, when Marple will be visited.

THE "VERTICAL" PLATEN.—A dispute is in progress between the Platen Machine Minders' Society and the Printing Machine Managers' Society as to which shall have control of this new type of machine.

ACCORDING to the *London Chamber of Commerce Journal*, the activity of German manufacturers in Syrian markets, regarding certain industries, including the paper trade, is worthy of note.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion	3/0
Three Insertions	6/0

For every line exceeding three lines 1/.

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion	1/6
Three Insertions	3/0

For every line exceeding three lines 6d

Sales by Auctions, Tenders,
Patents for Sale,
Legal and Financial Announcements

Per line	1/0

Replies may be addressed to Box Numbers, Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C.4, for which a fee of 6d. is charged to cover Postage of Replies.

Cheques and Post Office Orders to be crossed and made payable to STONHILL & GILLIS.

Telegrams: Stonhill, Lud. London.
Telephone: 8407 City.

Situations Vacant.

PROCESS ARTIST—AEROGRAPH for really first-class work; also Good GENERAL ARTIST.—Box 14229.

SUBSCRIPTION CANVASSER wanted for old-established Printing Trade Journal; ground, South of England.—Reply, in first place, to Box 14162.

Situations Wanted.

FOREWOMAN (PRINTERS) disengaged; thoroughly experienced and reliable; very energetic; highly recommended. — R. L., 3A, Brondesbury-road, Kilburn, N.W. 14234

LAYER-ON seeks engagement; all-round experience on Cylinder Machines; age 20.—G., 27, William-street, E.10. 14230

LOOSE-LEAF BINDER requires sit.; 15 years' experience English and American systems; take charge if required.—Replies to Box 14227.

MACHINE MINDER, Half-Tone, Colour, etc., requires sit.; first class.—63, Rosebery-road, Brixton, S.W.2. 14225

PRINTERS' WAREHOUSE OVERSEER, shortly at liberty, seeks re-engagement.—Cox, 4, Geary-road, N.W.10. 14219

SITUATION wanted as WORKS MANAGER or FOREMAN; anywhere; News or Jobbing; 20 years' English and Colonial experience; used to Lino's and Mono's; 35.—Gordon, 42, Dragon-avenue, Harrogate. 14233

THE PRINTERS' PROVIDENT ASSOCIATION, 39-40, Shoe-lane, E.C.4, is able to supply ALL CLASSES of EFFICIENT LABOUR for the Printing and Allied Trades at short notice; no charge —Phone, Holborn 527. 14180

WAREHOUSEMAN and CUTTER offers quick reliable services.—Box 14220.

Managers, etc.

MANAGER requires engagement as PRODUCTION, WORKS or GENERAL MANAGER; exceptional knowledge of all branches of the trade, also papers and other materials; first-class organiser, accustomed to handle large staff.—Write, Box 14222.

Machinery for Sale.

SMYTH-HORNE, LTD.,
1-3, Baldwin's-place,
Gray's Inn-road, London, E.C.1.

Occasionally we have Rebuilt Smyth Book Sewing Machines to offer, such Sewers having been thoroughly overhauled and refitted with New Standard Parts where necessary. We erect and teach on a trial basis.—Box 13993.

Patents, etc.

THE Proprietors of Patents, Nos. 137,471 and 137,507, relating to LEDGERS, wish to Licence or Sell the Patent Rights.—Inquiries should be addressed to John E. Raworth and Moss, Chartered Patent Agents, 75, Victoria-street, S.W.1. 14232

Miscellaneous.

PHOTOGRAPHIC STUDIO, wanted to Rent, near Ludgate-circus.—Box 14228.

620 FULLY PAID CUMULATIVE PREFERENCE SHARES of £1 each in James Burn and Co., Ltd., Bookbinders, of 33, Hatton-garden, E.C., for sale at 14s. 6d.—Box 14231.

WASTE PAPER: ITS RECOVERY AND RE-MANUFACTURE. By Jas. Strachan. A Fund of Information; price 12s. 6d.—Stonhill and Gillis, Publishers, 58, Shoe-lane, London, E.C.4.

STATIONERS' COMPANY AND Printing Industry Technical Board.

The annual meeting for advancement of technical education for printers will be held at Stationers' Hall, Ludgate-hill, E.C., on Friday, September 21st, 1923, at 6.30 p.m. The Right Hon. Lord Riddell, the Right Hon. C. W. Bowerman, P.C., M.P., W. Howard Hazell, J.P., T. E. Naylor, J.P., and representatives from trade organisations are expected to be present. The prizes and certificates gained during last session by London printing technical students will be presented by Mrs. Wilton Phipps, J.P., chairman of the Education Committee of the London County Council. Edward P. Vacher, F.R.G.S., Master of the Worshipful Company of Stationers, will preside. All interested are invited to be present.

Representatives also in Australia, India, South Africa, Canada, etc.

THURSDAY, AUGUST 23, 1923.

The Example of Mr. Ford.

DESPITE the thousand and one popular jokes made at the expense of the Ford car, the fact remains that Mr. Ford has brilliantly succeeded in doing something that badly needed doing, viz., producing motor cars at prices within the capacity of the multitude. In doing this, Mr. Ford has not only supplied a great public need, but he has in the process provided thousands of people with employment at good wages, and has incidentally made himself a millionaire. Now the greatest difficulty with which printers and bookbinders are faced in their present-day endeavours to increase their sales is the same problem that confronted Mr. Ford—the problem of reducing costs of production. Of course if one speaks of applying Ford principles to our own industry the foremost objection that springs to mind is the obvious one that methods which are successful in the mass production of motor cars, all standardised in form, size and materials, may not be successful under the different conditions of our own allied trades, as, for instance, in a bindery which has to bind books of all shapes and sizes in covers of very varied kinds. There is sense in this objection, but it does does not suffice to annul the value of Mr. Ford as an example. That some of our factories provide a big field for the application of more efficient management is strongly suggested in the article which we print on another page telling how a big New York bindery has endeavoured to apply Mr. Ford's methods and has succeeded thereby in reducing costs by 20 per cent. Mr. Ford's ideas are surely worth studying.

* * *

Falling-Off in Paper Imports.

LAST month's imports of paper and cardboard—879,356 cwts.—registered a decline of 148,167 cwts., or 14·4 per cent., against July last year, and an increase of 356,632 cwts., or 68·2 per cent., compared with the corresponding month of the preceding year. Contrasting last month's receipts with those of the two previous months of May and June, there is also indicated a significant drop in the quantity received. The main bulk of the drop in imports as well as exports is undoubtedly due to the dock strike. All varieties of paper imported—with the exception of "packings and wrappings" and "stationery"—show declines last month compared with July twelve months ago. The principal declines were in "printings and writings," from 410,262 cwts. to 331,504 cwts., and "strawboards," from 297,454 cwts. to 169,912 cwts. The arrivals of packings and wrappings during the month amounted to no less than 242,616 cwts., a figure which represents an increase of 48,421 cwts. over the consignments sent to this country in July last year. The c.i.f. value of the month's imports reached a total of £968,601, a decline of £160,307 (14·2 per cent.) compared with July last year, and an increase of £40,068 (4·3 per cent.) against the corresponding month of 1921. The falling-off that took place in the month's paper imports is not borne out when the seven months' statistics are considered. Thus we find that during January to July of the present year paper and cardboard receipts, standing at 6,557,708 cwts., exceeded those of the corresponding seven months of 1922 by 943,667 cwts. (16·8 per cent.), and by 3,308,688 cwts. (101·8 per cent.) contrasted with January to July two years ago. The total value of the seven months' imports amounts to £7,151,437, an advance of £682,167, or 10·5 per cent., compared with the corresponding period last year.

* * *

The Ruhr Chaos.

FOR those who doubt the effect of a German collapse on British industry and commerce, there is good reasoning in the statement of the F.B.I., an association which is free from any criticism of its outlook on foreign trading. Purely from self-interested motives it goes some length to demonstrate the utter impossibility of depending solely upon an "intertrading within the Empire" policy such as is frequently put forward by thoroughgoing Imperialists. The factor that is holding back trade development both at home and in the Colonies is European disruption. The F.B.I. certainly will not be accused of pro-Germanism when it looks forward to German stability as a means of improving British business.

* * *

Paper Distribution.

THERE is a quiet and steady tendency in many quarters to further the policy of correct paper distribution, *i.e.*, from mill to user, *via* the merchant or distributing depôt. The recent negotiations between the paper merchants and printers were perhaps not conducted primarily as a means of developing any pre-arranged scheme of distribution. Their main object was to eliminate direct trading under certain conditions. The agreement is, however, the first step in the direction of rational re organisation. The next move is with the merchants and the mills. It may be long delayed but it cannot fail to mature.

SUBSIDISED WAGES.—Mr. W. Howard Hazell writes to *The Times* in reply to a letter appearing in that journal, in which it is suggested, in order to reduce unemployment, that the Government should subsidise the wages of any additional workers that the employers engage. Mr. Hazell points out that the immediate effect of this method of subsidising wages would be that orders would be rapidly transferred from firms who are working without a subsidy and paying full wages to those firms who take on the largest number of subsidised workers. Employers paying normal wages would have to dismiss their men, who would go on the unemployed list, and they, in turn, might be re-engaged at less than normal rates of pay, subsidised by the Government.

Postage on Paper Samples.

Many Demands for Concession.

A timely letter reaches us from Mr. W. H. Burchell, of the Caxton Press, Ltd., Leather-lane, in respect to the representations being made to the Postmaster-General by the paper manufacturers of the United Kingdom for permission to send printed samples of paper at the printed matter rate, which is two ounces for ½d. "At the present time," writes Mr. Burchell, "they are forced to send these samples, which are the life-blood of their business, under the expensive letter rate—namely, 1½d. for two ounces. This amounts to a heavy tax on their publicity account. In consequence it restricts the output of printed samples of paper sent out to increase trade. Paper manufacturers have a strong argument for their demand and a recent precedent. The Postmaster-General in May last helped small newspapers, weighing under two ounces, to come under the printed matter rate (two ounces for ½d.). Before that time the minimum charge for a newspaper was a penny for six ounces. The Postmaster-General graciously stated that as a newspaper consisted of printed matter therefore a paper weighing up to two ounces could be sent for the halfpenny. The paper people argue that this is their case, and that their printed samples of paper consist of printed matter and paper, and consequently should come under the printed matter rate. The precedent referred to above is that printed samples of paper were carried for eighteen years—1897-1915—at the liberal rate of four ozs. a 1d. If the Postmaster-General will concede the printed matter rate many more millions of these samples will be sent out, thus benefiting in their production trade and commerce, decreasing unemployment, and increasing the postal revenue."

The paper and stationery dealers are very much alive to the urgency of this reform, as is evident from the following views expressed in the daily press:—

Mr. J. T. STEELE, secretary, Spicers, Limited, 19, New Bridge-street, E.C., writes:—For nearly two years I have been endeavouring to get the G.P.O. to allow printed samples of paper to pass through the post at the printed paper rate, instead of the letter rate, but have so far failed to move the powers that be. The letter rate is admittedly a deterrent to business, and papermakers, printers, publishers and stationers all suffer accordingly. The latest Post Office returns show that only in the case of printed papers was the estimated increase, consequent on the reduction of postal rates, reached; the 20 per cent. estimated increase turning out to be 25 per cent. If the P.M.G. would include printed samples of paper in the category of printed papers, I am confident that the revenue would be still further increased, trade legitimately helped, and without cost, but otherwise, to the State. Printed paper samples from abroad are already carried at the printed paper rate.

Mr. H. R. MARSH, the Stationers' Association of the United Kingdom, Avenue-chambers, 4, Vernon-place, Southampton-row, W.C.1, states:—On behalf of some thousands of retail stationers who are members of this association, and I may say confidently, in the interests of the stationery trade in general, I cordially endorse the letter from Mr. J. T. Steele, regarding the desirability of letting printed paper samples pass through the post at the printed paper rate instead of being treated as letters, as they are at present. Unlike many appeals which are made to the Postmaster-General, this is not one which involves a loss of revenue to the Post Office, but, on the contrary, will not only do much to assist the trade of the country and reduce unemployment in the printing industry, but will actually prove an important source of additional revenue to the P.M.G.'s Department.

Mr PERCY BARRINGER, president of the National Stationers' Association, also touches on the subject:—A month or two ago, when the mark was at a comparatively high rate, it was possible for stationers here to send stacks of sample notepaper to Germany to be reposted to British addresses at twenty-three a penny. The figure will now be nearer three hundred a penny. And yet our postal authorities persist in regarding our samples, when posted in this country, as letters, and charge us threehalfpence each for them. The grievance of the stationers is that while printed circulars of all kinds are allowed to go by halfpenny post, they are prevented from sending half-sheets of notepaper as samples to prospective customers. It is urged by the association that, as their samples are printed papers, they therefore come under the printed-paper rate. If we were allowed to use the halfpenny rate we could circularise three times at least as many people, and, let us hope, obtain three times as much trade, with consequently more than a triple increase in revenue to the Post Office.

The United Kingdom Paper Bag Manufacturers' Association, in a communication to the Postmaster-General, urge the extension of the existing postal regulations to printed samples of paper. It is pointed out that the most obvious remedy for the present state of unemployment lies in the re-absorption of the unemployed by their respective trades, and this can only take place by reason of improvement in the state of British trade. Moreover the concession asked for is only technical and not likely to involve the Post Office in any financial loss.

Personal.

THE marriage took place on Tuesday of Rev. Michael Neville Lake, M.A., vicar of St. Oswald's, Walthamstow, son of the late Mr. Reginald J. Lake, at one time president of the Master Printers' Federation.

THE bride, who, like the bridegroom, is a Master of Arts at Oxford University, is Miss Mary Catherine Amy Barclay, eldest daughter of the vicar of Birtley.

MR. H. A. BETHELL, chairman of the Organisation Committee of the Joint Industrial Council, is to attend the J.I.C. sports meeting at Belmont Hill, St. Albans, on Saturday, and it is expected that the joint secretaries of the J.I.C., Messrs. A. E. Goodwin and A. E. Holmes will also be present.

MR. GOODWIN returns this week to 24, Holborn, after an enjoyable holiday spent at Seaford, Sussex. This is the first time for several years that his holiday has not been interrupted by labour trouble. In spite of the blessings of "stabilisation," however, there are many problems ahead, labour and other, which will make big demands upon the renewed energy which, we trust, his holiday has brought him.

MR. HOLMES returned to town early in the week. He chose Norfolk, we hear, as his holiday ground this year.

MR. A. J. BROOM, who was formerly liaison officer in the Industrial Relations Department of the Ministry of Labour, has been appointed to the staff of the Newspaper Society.

MR. H. CAWTHORNE, of Newcastle-on-Tyne, has been appointed manager of the Printing Department carried on under the auspices of the Newcastle Education Committee. There were 130 applications for the post.

IT is announced that the Right Hon. G. H. Roberts, M.P., has become chairman of the Westminster Advertising Service, Ltd. Mr. Roberts is the first ex-Cabinet Minister to take an active part in the advertising profession.

MR. THOS MALTMAN has just retired from the service of Messrs. A. and W. Kennedy, printers and stationers, of the Dolphin Works, Pollokshaws.

MR. AND MRS. ROBERT BAGSTER, of 15, Paternoster-row, celebrated their golden wedding on Tuesday. Mr. Bagster is the son of Jonathan Bagster, the well known Bible publisher.

MR. HERBERT JEANS, chief of Reuter's Parliamentary staff, has been appointed chief editor of Reuter's Agency in succession to the late Mr. F. W. Dickinson.

MR. DOUGLAS WILLIAMS, who has been acting chief editor, is returning at his own request to resume his post as Reuter's general manager for North America.

SIR ALFRED ROBBINS, London correspondent of the *Birmingham Post*, is retiring from active newspaper work after 50 years.

MR. L. MORROW, of the literary staff of the *Northern Whig*, Belfast, has been presented with several books and a case of pipes by his colleagues on leaving to take up an appointment in Dublin.

MR. WILLIAM STEWART, a member of the literary staff of the *Glasgow Herald* for 42 years, and ex-chairman of the Glasgow and West of Scotland District of the Institute of Journalists, has retired from active journalistic work.

MR. STANLEY COUSINS, who recently underwent a slight operation, is, we are glad to learn, making satisfactory progress.

MR. B. W. SCRIBNER, chemist of the West Virginia Pulp and Paper Co., has been selected by the Bureau of Standards, Washington, as successor to Mr. F. A. Curtis, chief of the paper laboratory of the bureau, who resigned as from July 1st.

MR. SACHIO KORIYAMA, representing the Japanese Government Printing Office, is spending several months in the United States studying American methods and machinery. Mr. Koriyama is connected with the Bureau Staff which produces Japan's paper money and one of the special missions which is now requiring his attention is the selection of better inks for printing this currency.

MME. DE GAINZA, of Buenos Aires, who is reported to have been robbed of jewellery, valued at about £32,500, is the proprietor of the Buenos Aires daily newspaper *La Prensa*.

GERMANY'S new Chancellor, Herr Stresemann, is an experienced journalist, having been at one time editor of the *Saxische Industrieller Zei ung*.

London School of Printing.

Fine Work by Students.

The "Year Book of the London School of Printing and Kindred Trades"—together with a batch of other examples of students' work in the way of booklets, posters, etc.—remind's us that the high-quality printing work carried on at St. Bride School is not a thing of the past, but that the London School of Printing is continuing, and even attempting to rival, the successes registered at St. Bride's. Needless to say, the printing included in the new portfolio reflects great credit on the students who carried it out and on Mr. J. R. Riddell and his able band of helpers, whose enthusiasm and ability have led to the results attained. The examples cover a very wide range, including even some admirable photo-litho work, and all speak eloquently for the resources of the new school. There will doubtless be a rush for enrolment when the school's doors open next month, and intending students will do well to be early with their applications.

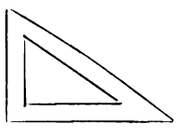
The Bookbinder



Efficient Management in the Bindery.

Ideas which Cut Costs by 20 per Cent.

When that famous bookbinding concern, the J. F. Tapley Co., of Long Island City, New York, moved into new quarters, many profitable new ideas were put into service; ideas which came from a search for underlying principles plus a faith in the wide applicability of fundamental plans. Some of these are of very general interest, and we therefore reproduce in part an account written by Mr. E. W. Palmer, president of the company, in a recent issue of *Factory*, the magazine of management.

Merely in the cost of handling our product between operations, writes Mr. Palmer, we have saved $10,000 a year by moving from a four-storey factory to one in which all operations are grouped on a single floor. This is the largest individual saving I can point to that can be directly and accurately measured; but our cost figures show beyond a doubt that our average manufacturing costs are a trifle less than 80 per cent. of what they were in the old plant. When I finish describing the improved methods, I think it will be apparent that such betterments as we made are easily within the reach of most concerns, no matter how well they are managed; for our old plant was far from antiquated or run down.

After considering from all points of view whether to build or to rent—and where—we decided to rent a floor in a concrete building in Long Island City. This building is in the form of a hollow triangle (as roughly indicated in the figure), which at first glance may seem to be a poor shape, but which we find works out for us to better advantage than would, probably, any other.

Studying Mr. Ford.

Before making a lay-out, even tentatively, we decided to study at first the ideas that have worked so well in the Ford automobile plant. We ignored a lot of sincere wellwishers who tried to save us time and mistakes by telling us that Ford's methods are undoubtedly effective in plants that turn out a product of a single design year in and year out, but that our business is different and that straight line production is out of the question for us.

There might seem offhand to be a measure of reason to that argument, for our business is the binding of books. We are apt to have in the shop at any one time, a hundred or more jobs, all different, ranging from a lot of 250 small, thin, vest-pocket memorandum books to a quarter of a million large, heavy catalogues, or 10,000 sets of the Encyclopædia Britannica. Certainly such a variety of items and quantities does not sound much like Ford's quantity production of a single design. In fact, we are actually an edition shop that must be willing and able to handle any job of bookbinding that is offered to us. We knew that we would not be able to adopt all of the Ford methods, but we did believe that there was much we could learn from his shops, inasmuch as bookbinding is essentially a problem in progressive operations and progressive assembly. So a member of our organisation spent several days in the Ford plants absorbing ideas and methods which the automobile men were most painstaking in explaining to him.

Perhaps the biggest result of our study has been a somewhat intangible, but, I believe, a most important one; we have absorbed what I might call the Ford point of view. When a problem comes up that is new to us, I find that we are all inclined to ask ourselves, "How would Ford solve that?" The result is that we find ourselves solving the problem in the light of the manufacturing as a whole, and not gaining a temporary improvement in a single operation at the cost of disorganising another.

Since our manufacturing is progressive, we have arranged the machines in batteries in the order in which they perform their operations. Briefly, our operations consist of cutting apart the flat printed sheets, made up as 16, 32, or 64 pages, as they are delivered from the press room on flat trucks; folding them into sections or signatures; inserting or pasting in illustrations; affixing fly leaves front and back, and the leaves which paste down against the cover; sewing the sections into complete book form; trimming the edges; shaping the book and reinforcing the back for the cover.

While these operations are going on the covers are being made. This consists of cutting the cloth, leather or paper, the pulp board which stiffens the cover, making the covers by hand or by machine, adding the stamping in ink, gold, or other materials, thus forming the complete cover. Then the book must be cased into the cover in order to complete the book. When this is done, the books must dry under pressure for several hours until the moisture of the paste and glue used in the operation has evaporated and the book has dried into shape.

Thus it is apparent that we make two separate sub-assemblies simultaneously and bring them together in a final assembly. Offhand, it may seem that this calls for straight-line production in a plant of almost any shape other than the triangular one we have. Actually, after a little study, we found that this somewhat odd shape is nearly ideal.

Important Storage Space.

In one corner of the triangular building are two stock rooms for raw materials—one for the printed sheets and one for materials that go to make up the covers. The printed sheets go down one side of the building, where all of the various operations they need are performed upon them. In the meantime, the materials that go into the covers are moving down the other side of the building, and are gradually assuming the appearance of covers. The two meet on the third side of the triangle, are assembled, pressed and wrapped. Inspections are made on both of the sub-assemblies after practically every operation.

Now note, if you please, that we have placed machines only along the outside walls of the building, although there is plenty of room and satisfactory light along the inside walls. We keep this space for temporary storage of goods in process. It is obvious that with perhaps 100 different jobs in the plant at once we may be called upon to make a delivery of part of nearly every job every week, but we have to set up a machine for an order just as does a machine shop. It is expensive to be setting up and knocking down a machine constantly, which is what we would be doing most of the time if we ran only so much of a job at once as has to be delivered in any one week, say.

This method of using for storage—for what is commonly called a non-productive purpose—space that might be used for productive machinery, is actually of great help in getting the maximum of production at the minimum costs. It reduces the idle time of machines tremendously. We literally have reservoirs of goods in process at exactly the place where they will next be needed; that helps to keep the machines active full time. At any rate, there is seldom any excuse for a machine waiting idly, while there are goods upon which it might be working. If there is work for it to do, that work is in plain sight—within 30 feet at the most.

Plant Flexibility.

I have said that our machines are arranged in batteries. These batteries are made up of machines of the same type—folders for instance—but they are not all of the same size, nor fitted for doing exactly the same jobs. Therefore, it is often desirable to move a machine from one location to another quickly and inexpensively. When a machine gets out of kelter it is better to remove it to the repair shop than to have the mechanic working on it in the department. Therefore, we have, so far as seems feasible, made our machines portable. All machines that weigh less than one ton are mounted on platforms which run on castors, and so can be easily moved about. The platform carries not only the machine, but its individual motor, speed regulator, automatic switch cut-off, pilot light, and so on. There is not a belt in our plant nor are there any group electric drives. That costs a little more for the original installation, but the saving in idle time and the increased flexibility pays excellent dividends on the extra investment.

The motors are connected to the power lines by a flexible cord and plug. The overhead wire is carried in metal conduit hung from the ceiling, and equipped with nine outlet boxes to each bay. That is sufficient to enable us to place a machine in the exact spot desired, and to know that it will be almost directly under an outlet to which it can be plugged in.

In regard to glue pots, it was the custom to let each man make his own glue. We have eliminated this by establishing a glue laboratory wherein are prepared, on formulas, the hard and flexible glues used in the various operations. Each operator having use for a glue kettle and a brush, has one with his own number on both articles. He draws from the glue-room the glue that he needs for the work in hand. He likewise receives the correct brush for the job. The glue pot is made entirely of copper and was thoroughly soaked and polished the day before.

We have given a great deal of attention to flexibility in our organisation as well as in our equipment. One of the best examples is in our planning department. In view of the diversity of work passing through our plant, accurate planning is essential or prompt deliveries would be impossible and profits would be minimised; consequently when business is good we can afford a good-sized planning force, but when it drops off we cannot.

Keeping Planning Department Flexible.

This problem is solved by having a head of the planning division with two assistants. This is the skeleton force. The moment business drops off, these three only, in conjunction with the superintendent and the foremen, handle the manufacturing problems which under pressure would be spread over four times as many clerks.

In other words, the planning department can be expanded or shrunk almost automatically with the flow of work in the shop. Some of the clerks are put in the factory to work and then drawn back into the planning department, while less essential ones can be laid off and new ones taken on without detriment to the general planning function.

There are a few items of plant equipment that have been effective in saving money for

Digitized by Google

us that I believe could, with minor changes, be adapted to many plants, even in widely different industries. For instance, after books are bound it is necessary while they are still damp to put them under a considerable pressure for from 6 to 12 hours. This was done for years by putting the books in heavy screw presses which took up considerable room and cost much money. To take care of our present production, we would need at least 100 of these presses. Instead of the hundred we now have only seven. The books are placed in the press with a heavy board at the top and bottom. These boards are drilled at each end and fitted with casting to receive tension rods of steel. One end of the rod is threaded and equipped with a hand wheel which is tightened down while the books and the boards are in the press, to hold the tension. The screw of the press is then loosened and the stack of books, still under the original pressure, is slid out on a special truck and moved to the next department. When the 6 to 12 hours' needed pressure is up, the tension rods and boards are removed and the books are ready for the next operation.

Notes and News.

The State of Trade.

Trade in the bookbinding section can only be considered as poor, and rather worse than a month ago. The falling off affects every branch of the trade, but in particular the letterpress side is experiencing a very lean time. On the stationery side there is a dearth of Government and Corporation work and only the banks appear to be placing bulky business. Publishers are putting very little new business forward, owing to the poorness of the demand. The season has been one of the worst for a long time so far as book consumption is concerned. Evidently holiday-makers have not the funds for investment in light literature this year. Within another month or so there should come the customary revival in the text and technical book trade. To meet the demand a number of new books have already been prepared.

British v. Imported Machinery.

The experience of bookbinders with orders on hand for German machinery is rather a trying one. We hear of instances in which equipment has been on order for months. Promises of delivery are abundant but there is little actuality. Now there is a strike in the German engineering industry which bids fair to put another month or two's extension on any delivery date. The British engineers undoubtedly leave a great part of the bookbinding machinery field in the hands of Germany and U.S.A.

Trouble with Dyes.

British dyes are a well subsidised and carefully protected commodity but if we are to judge by results, all the safeguarding and subsidising effected has so far failed to produce a reliable type of colour. In fairness it must be conceded that the dye industry is young and the problems facing its institution gigantic. Doubtless they are being steadily surmounted. This unfortunately does not help the bookbinder who has to re-case a whole batch of books because the cloth had faded in between making and delivering. Nor does it help in the case of coloured basil which assumed quite a different tint marked by blotchings after covering. These are actual occurrences within the last few days in our own experience. In both cases the material was of standard quality supplied by makers of repute. The glue was acid-free, and the paste was of guaranteed quality. The immediate admission of the leather manufacturer was that the dye in use was unreliable. Paper-rulers have a fairly good experience of modern ruling inks and there are few of them who do not find cause for complaint.

Dutch Strawboards.

Dutch strawboards have eased down in price considerably within recent weeks. The average price at the moment is in the region of £8 15 per ton delivered, for substances between 8 oz. to 16 oz. For heavier weights the usual £1 5s. per ton for extras is charged. In one quarter a special offer of 12 oz. boards at £7 5s. per ton, carriage forward was made and a further lot of 2 lb. boards at £8 7s. 6d. These were for immediate clearance and do not represent actual market values. It can hardly be anticipated that prices will fall much lower or that they will keep down to the present level which represents almost a losing proposition to the makers. Possibly the British board is making too much headway for the liking of the Dutch mills.

Prices of Boards.

White-lined strawboards are quoted £12 5s. per ton for 8 oz., £11 15s. for 10 oz., £11 5s. for 12 oz., £11 for 14 oz., £10 15s. for 16 oz., £10 5s. for 2 lb. An inferior white-lined grade is quoted at the same price as unlined. First quality glazed leather boards are listed at £19 5s. per ton; second grade at £18 10s. per ton; third grade at £18 5s. per ton. The market price of white wood pulp boards remains unaltered at £18 per ton 80's to 350's; £19 per ton 450's to 500's; and £20 per ton for 600's. English black machine-made millboards are in good demand at £27 10s. per ton, and hand-made bookbinders' board is quoted from £38 to £42 per ton.

The Leather Market.

The leather market is quiet, but prices are firm. Within recent months two well-known firms in the leather trade have gone out of existence. Raw material is difficult to secure in bulk and high in price. For the best pelts American competition has to be faced as a regular feature and the U.S. agents can afford to pay top price. Approximate market prices for finished bookbinding leathers are as follows: Thin glazed skivers, 5d. per sq. foot; stout skivers, 6d.; pastegrains, 5½d. to 6d.; thin coloured basils, 7d. per sq. foot; ditto for halfbinding, 8d.; stout basils, 9d.; grained basils, 10d. to 1s., according to colour substance and design; roller basils, 6½d. to 7d.; fair basils, 9d.; rough fleshes, 8½d.; rough goats or morocco, best, 1s. 2d.; seconds, 10d.; rough calf, best, 1s. 2d.; seconds, 10d.; fair calf, best, 1s. 9d.; seconds, 1s. 6d.; pigskins, best, 1s. 6d.; seconds, 1s. 3d.; anglos, 1s. 9d.; seconds, 1s. 6d.; law calf, best, 2s.; seconds, 1s. 10d.; hard-grained goat's, 2s.; best morocco coloured, 2s. 3d.

Miscellaneous Materials.

Other materials remain practically unaltered. Standard quality bookbinder's glue is firm at 45s. per cwt,, calico ranges from 4½d. to 6d. per yard, gold leaf is firm at 47s. per 1,000 for 3¼ in. square, and 59s. per 1,000 for 4 by 3¼ in. A reliable grade of imitation gold leaf is offered at 25s. per 1,000 leaves 5 by 5 in. English gold leaf is listed at 65s. per 1,000 3¼ in. square.

Training for Bindery Women.

Classes at the London School.

An important addition to the courses of training available at the London School of Printing, Stamford street, is to be made for the session 1923-24, which commences on September 24th next. Arrangements are being made to inaugurate special binding classes for women workers, to comprise day classes for women learners (9 to 1 or 2 to 6 on days to be arranged—fee 15s.), also evening classes (Tuesday or Wednesday, 6 to 9—fee 10s.). These classes, we understand, are to be conducted by Mr. Chris. W. Atkins, who is being added to the staff of the School.

The Syllabus.

The syllabus will include the following: Technical terms, general knowledge, paper—manufacture, weights, sizes, sub-divisions, general terms; magazine and catalogue work; folding, hand and machine in all its phases; stitching, wire and thread, hand and machine; gumming, holing and eyeletting; account book work; interleaving; collating; gathering; numbering and numbering machines; sewing by hand and machine; taping; feeding ruling machines; perforating; etc.

Every session shows an increase in the number of applicants for instruction at the London School of Printing, and many have to be refused enrolment. Early application, therefore, is essential to those who desire a place in these classes. Application forms and all information can be had at the School, which will be open for enrolments from 10 a.m. to 5 p.m., and until 8 p.m. after September 17th, 1923.

Printing, Bookbinding & Kindred TRADES OVERSEERS' ASSOCIATION.

In spite of the holiday season there was a good muster of members at the August meeting of the Association, held on Tuesday of last week at the usual headquarters, St. Bride Institute, Bride-lane, E.C.4. In the absence of both the president and the vice-president, who were on holiday, Mr. Geo. A. Eden was unanimously voted to the chair. After some brief routine business the evening was mainly occupied in an instructive lecture, entitled "Some Problems," by Mr. A. J. Daines.

After the reading of the minutes—which were duly confirmed—several items of correspondence were submitted.

Bookbinding Classes.

A letter from Mr. J. R. Riddell drew attention to the necessity of students in the various binderies making early application regarding the classes that start in September, so that the students may be placed in their proper grades. The letter also mentioned that handbills were being distributed giving particulars of the new binding classes being started for women. In this connection Mr. Riddell made an appeal to the members to induce their women workers to take advantage of the classes.

They would be pleased to know, said the secretary, that one of their own members, Mr. Chris. W. Atkins, had been appointed instructor of these new classes.

Other letters had reference to the death of one of their oldest members, Mr. R. W. Pearce and to matters relating to unemployment amongst the membership.

New Members.

The two following gentlemen were unanimously elected to membership: Messrs. Percy Geo. Chapman (honorary), printer and stationer, Camberwell; T. Blackman—overseer, binding department, W. W. Sprague and Co., Ltd.

The chairman, in felicitous terms, welcomed the new members.

For the members' smoker, to be held on October 2nd, at the Talbot Restaurant, London-wall, E.C., Messrs. A. Cox and J. Jones were elected stewards. In connection with this event the secretary invited members and their friends willing to assist to communicate with him.

Mr. A. J. Daines was then called upon for his lecture. The address, under the cryptic title of "Some Problems," dealt with the seeming disharmonies in nature. Commencing with the laws relating to "reversion to type," and concluding with the difficulties that exist in educating the masses, the lecture proved most interesting.

Discussion on the lecture was contributed by, among others, Messrs. F. J. Ibbott, A. S. Long, G. A. Rutherford and G. A. Eden.

A vote of thanks to the lecturer was proposed by Mr. J. Sandilands and seconded by Mr. Rutherford.

A like resolution was proposed to the chairman, and the meeting was brought to a close.

A REPORT on trade conditions in British West Indian Islands states that the market for pulpboard and wallboard is open to development. News-print requirements are limited, but supplies, which at present are furnished by Canada, are not nearly so large as they might be if the business was taken more seriously. There is a good market for sulphite bonds from 16 to 24 lbs.

DIVIDENDS AND REPORTS.

AMALGAMATED PRESS (1922), LTD.—The report for the year ended June 30th last—the first issued since the capital reconstruction in May last year—shows this company to be in a strong position. The balance-sheet totals are very much larger than those of the old company, the paid-up capital of the new concern being £3,271,716, an increase of £2,042,289. The principal asset—namely, "cost of goodwill, copyrights, freehold, and leasehold properties, machinery and plant"—stands at £2,186,000. The second largest item is "investments at cost," £726,000. Sundry debtors, £392,000, are nearly balanced by the amount of £316,000 owing by the company to sundry creditors. The cash holding consists of £600,000 on short loan, £174,380 at banks, and £436 in hand—in all £774,816. For the past twelve months the net profits were £531,595, and the final dividend is to be at the rate of 2s. per share, making 15 per cent. per annum. This is being paid on an ordinary capital four times as large as that of the old company, which had for many years paid dividends at the rate of 40 per cent. per annum. Eliminating questions of income-tax, the distribution is equal to 60 per cent. on the ordinary capital of the old company. The report states that the net sales of the periodicals and magazines are satisfactory, and the revenue from advertisements during the year was the largest in the history of the company.

DAILY MIRROR NEWSPAPERS.—Interim dividend declared on ordinary shares of 1s 6d. per share.

SUNDAY PICTORIAL NEWSPAPERS.—Interim dividend declared on ordinary shares of 1s 3d. per share.

ABERDEEN UNIVERSITY PRESS.—The report of this concern indicates that net profit has declined from £1,600 to £500. Nevertheless, with the help of the sum brought in the directors pay the usual dividend of 12 per cent. on the ordinary shares, thereby reducing the carry-over from £1,700 to £400.

NEW COMPANIES.

FOUBERT'S PRESS, LTD.—Capital £1,000 in £1 shares; to acquire the business of a printer, now carried on at 20, Foubert's-place, Regent-street, W.1, by Alexander B. Bose. Private company. Directors: A. B. Bose and H. G. James. Registered office: 20, Foubert's-place, Regent-street, W.1.

GRIFFIN AND SHEARD, LTD. — Capital £1,000 in £1 shares; to take over the business of a printer, stationer and bookbinder, carried on by E. Hunt, at 7, Stamford Arcade, Ashton under-Lyne, as Griffin and Sheard. Private company. Subscribers: E. Hunt, S. Broadkut and W. Walker. First directors not named. Registered office: 7, Stamford Arcade, Ashton-under-Lyne.

CATHOLIC PRESS, LTD.—Capital £10,000 in £1 shares (5,000 preference and 5,000 ordinary). Printers, publishers, bookbinders, etc. First directors: J. English, F. T. Sweeney, F. O'Reilly, L. Cassidy, F.R.C.S.I., and F. C. Flanagan. Registered office: 37, Westmoreland-street, Dublin.

ERA, LTD.—Capital £5,000 in £1 shares; to adopt an agreement with A. E. Abrahams, and to carry on the business of newspaper proprietors, publishers and printers, advertising agents, etc. Private company. Private company. Subscribers: W. J. Lovell and E. J. Hawes. First directors; Sir Thomas Beecham, Bt. (chairman), and A. E. Barwood. Solicitors: Bartlett and Gluckstein, 199, Piccadilly, W.1.

PENN, BEAMS AND CO., LTD. — Capital £1,000 in £1 shares; to acquire the business of a wholesale stationer carried on by H. H. Penn at 30, Fetter-lane, Fleet-street, E.C., as "H. H. Penn and Co.," and to carry on the business of paper merchants and agents, paper bag manufacturers and agents, paper manufacturers, Christmas card manufacturers, etc. Private company. First directors: H. H. Penn, A. H. Beams and J. E. Guest. Registered office: 30, Fetter-lane, E.C.4.

ABBS AND STURDY, LTD.—Capital £5,000 in £100 shares; booksellers, stationers, stamp sellers and dealers, music sellers and publishers, manufacturers of and dealers in musical instruments, etc. Private company. First directors: G. Abbs and A. Sturdy. Registered office: 4, Church-street, York.

QUIK-SET DISPLAYS, LTD.—Capital £500 in £1 shares; sign, show card, price ticket and display advertisement manufacturers, advertising agents, printers, publishers, etc. Private company. First directors: A. R. Heath and J. J. Leyden. Registered office: 98, Cherry Orchard-road, Croydon.

EAST AND WEST TRADING CO. (DANZIG), LTD.—Capital £2,000 in £1 shares; manufacturers of and dealers in wood, paper pulp, all products of wood, railway and steamship agents, general insurance agents, etc. Private company. Subscribers: H. T. Barclay and W. S. Tubbs. Registered office: 15, Queen-street, Cheapside, E.C.4.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

ENTERPRISE PRINTING WORKS, LTD. (Northampton).—Particulars filed of £1,600 debentures authorised July 1st, 1923, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

PHOENIX WORKS, LTD. (Printers, etc., Sunderland).—Satisfaction in full on August 3rd, 1923, of mortgage dated June 20th, 1922, securing £1,497.

PHOENIX WORKS, LTD.—Mortgage dated August 7th, 1923, to secure £2,000, charged on freehold premises, 12, Vine-place, Sunderland. Holders: Rev. R. O. Hitchinson, the Vicarage, Boston, and A. M. Oliver, West House, Cleadon, Durham.

BLACKPOOL GAZETTE AND HERALD, LTD.—Satisfaction in full on November 2nd, 1921, of mortgage dated August 12th, 1907, securing £1,800. (Notice filed August 8th, 1923).

WOOLLEN AND CO., LTD. (Advertising contractors, etc., Sheffield).—Satisfaction in full on May 22, 1923, of mortgage debenture dated June 26th, 1912, securing all moneys due or to become due, not exceeding £800.

Papermaking in Madagascar.

Two important grants have been made by the Governor-General of Madagascar with the object of developing the use of local fibres in the manufacture of paper.

One applies to an area of 104,000 hectares on the East coast. Attention is directed to the available supplies of cyperus papyrus and herbaceous plants. It was proposed to form a company which will be called upon to supply 3,000 m. tons of textile fibres, and 6,000 m. tons of pulp for paper manufacture.

The second grant relates to the province of Tamatave. The grantees are to build a mill to treat both textile and papermaking fibres.

Gold Inks

(LETTERPRESS)

IF you have never yet tried Gold (Letterpress) Inks or are familiar only with those hitherto obtainable, Lorilleux and Bolton's gold inks will be a revelation to you.

No modern printer keen on cutting costs and speeding up production can possibly afford to ignore the handiness and economy they offer.

The following points show the great superiority of Lorilleux & Bolton's gold inks:—

1. They do not clog or harden on the rollers.
2. Need no specially skilled operator.
3. Are suitable for either platen or cylinder machines.
4. The machines can be run at normal speed.
5. Retain their brilliance for long periods.
6. Print the type thoroughly and heavy solids without difficulty.

Available in light and dark shades of gold as well as silver.

Write for specimen prints and generous sample tin to-day.

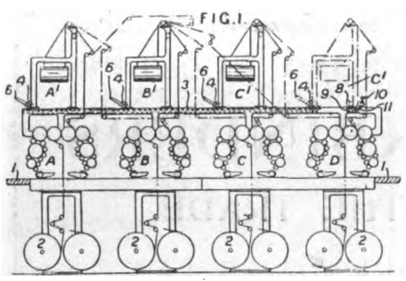
New Inventions

A Battery of Folders.

In an invention patented by Messrs. Linotype and Machinery Ltd. and Mr. B. J. J. Goulding the folders of a battery of printing units are individually capable of movement into operative relationship with the different printing units of the battery so that when the units are working in multiple the folders may be moved to the most advantageous position, and may also be movable transversely so that

FIG. 1.



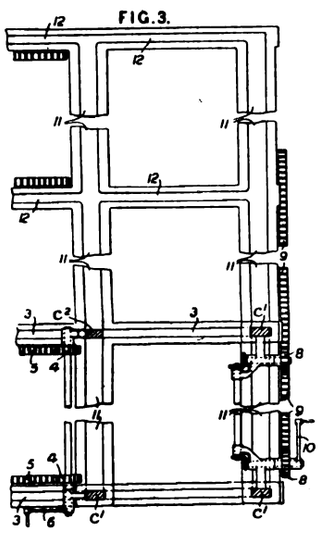


FIG. 3.

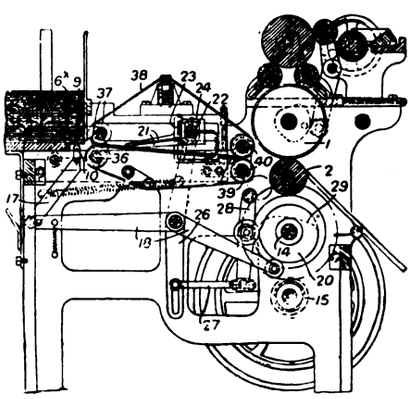
any folder not required for use in the running of the said battery may be moved across to co-operate with the printing units of a second battery which may not have as many folders as printing units. In the arrangement shown, four printing units A, B, C, D are located on the floor 1, the web rolls 2 being below the folders A^1, B^1, C^1 above, or vice versa, to economise floor space. Each folder is movable along the tracks 3 extending longitudinally of the printing units by means of a crank-handle 6 operating pinions 4 engaging fixed racks 5. A transverse rack 9 co-operates with other pinions 8 driven by a crank handle 10 on the folder C^1 for moving the latter along transverse tracks 11 connecting the tracks 3 with the tracks 12 of a second battery of printing units arranged alongside the first. Fig. 3 shows also three of the four standards C^1 of one of the folders, these standards terminating in blocks C^2 engaging the tracks 3, 11.

Automatic Sheet Feeding.

An automatic sheet feeding device for feeding newspapers to a rotary machine for printing late news, as patented by Messrs. E. and H. Bush, comprises a suction device adapted to draw down the front edge of the lowermost newspaper of a pile, reciprocating grippers 21 which seize the separated paper and draw it from beneath the pile, and endless bands 38 stretched between rollers 37, 40, which carry the paper to the printing and impression cylinders 1, 2. The suction device consists of a hinged plate 6^x formed with apertures 9 connected by a pipe 10 to a pump, the



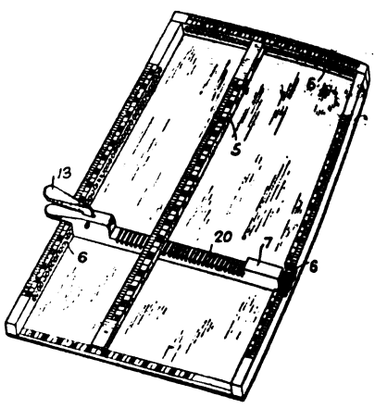


plate being lowered to separate the bottom sheet by a link 17, and lever 18 actuated by a cam 20 on a shaft 14 driven from the main shaft 15. The grippers comprise fixed members on a cross-bar 23, and movable members on a shaft 22 all carried in sliding end bearings 24 reciprocated by a lever 26, and link 27, lever 28, and cam 29. The movable grippers are opened by a vertically reciprocating bar actuated by cam-and-lever mechanism. The rollers 40 are geared to the shaft 14, and the shaft 36 of the lower rollers 37, and the shaft 39 of the upper rollers 40 are elastically mounted, so as to hold the adjacent portions of the bands 38 in yielding contact.

Printers' Galleys.

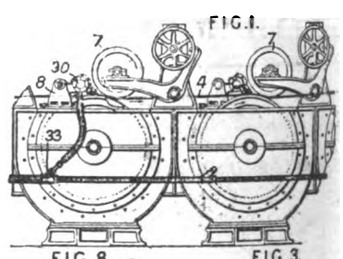
An invention by Messrs. F. W. and J. N. Manton refers to galleys of the kind in which the types are held in place by means comprising a longitudinal bar adjustable on a notched cross bar, the sides of the galley are pierced with holes 6 to receive pins on the ends of the cross bar 7 and longitudinal bar 5, the cross bar being locked in position by means of a catch in the form of a sliding pin operated by a finger piece 13. The longitudinal bar 5 is of angle section, and its downwardly-directed edge engages a rack 20 on the cross bar. The bar 5 and the sides and

ends of the galley are provided with graduations.

Paper Board Machines.

A British patent has been granted to Mr. R. Haddan for an invention relating to paper board machines. Free water and air bubbles are removed from the pulp layer or layers of a paper board or cylinder machine by a vacuum sluice applied at the top of the cylinder, above the felt, and in front of the couch roll 7. The sluice consists of a tubular body 12 provided with a slotted extension, the flanges 12a, 14a, of which rest on the felt 4. Cylindrical ex-

FIG. 1.



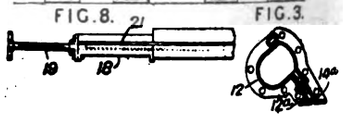


FIG. 8. FIG. 3.

tensions of the sluice are provided with inspection windows 30. The sluice is adjustably mounted in standards 8 and connected at 33 to a suction pump. The length of the slot is varied accordingly to the width of the pulp layer by a valve plate 21, Fig. 8, secured on a sliding rod 19 mounted in an extension 18.

Canadian Tariffs.

Quite a propaganda campaign is being conducted by the Canadian Manufacturers' Association in furtherance of its tariff views as embodied in the following resolution: "The Canadian Customs tariff should be immediately and substantially increased on finished products, and when the higher rates have been duly put into effect, Canada should endeavour to increase her export trade by making preferential tariff arrangements based on the principle of bargaining with other countries, particularly the countries of the British Empire."

A Famous Type-Designer.

Life-Story of Frederic W. Goudy, the American Typographical Artist.

We who have known Goudy for many years, know that he is of that order of simple men who make the world a pleasanter place to live in because of the good they do and the good way they do it. They have much to give us, and they give it with a sincerity of heart and purity of motive, which make their gifts twice blessed. If our friend may take pride in that he has called forth our appreciation and gratitude, we may take a higher pride in that he has thought so well of us as to serve us from the bounty of his mind and the riches of his heart. There have been printer craftsmen of greater genius than Goudy, but there have been few who possessed as great a graciousness of friendship-making nature. The combination is so rare, that it lifts the man out of his narrow circle of craftsmen into the larger field of humanity itself. The men of the past may compel our admiration but Goudy draws from us both our admiration and affection.

Groping for a Life-Work.

When we go over the mere quantity of work done by him, we begin to realise not only the energy of the man, but the devotion of the spirit in which he worked. In 1896 Goudy was a book-keeper in Chicago. How he ever came to be a book-keeper I do not know. It is one of the evils of our economic system, that it leaves to chance the happy union of the man and his work. Goudy was not born to be a book-keeper. He was born to be a printer craftsman, and it took him seven years before he was able to make his birthright good. With no aid from anyone, he worked in his leisure hours at designing lettering, and so distinguished were his achievements, that he was able to sell his product both to the type founders and the advertising agents who were in want of what he had to offer them. He worked for clothiers and department stores to give to their advertisements that distinction of presentation which more than reflected the reputation of their business. But all this was but the preliminary work necessary to enable him to obtain the means to do what he wanted to do. What he wanted to do was to be a printer on his own account, designing types and printing books that would express himself in as excellent a manner as his ability and sincerity demanded. He hoped that his best when done would give the like pleasure to others that had been his in the doing.

Printing and Designing.

Just twenty years ago, in 1903, Goudy set out on his venture, and erected his Village Press at Park Ridge, Illinois. He designed his own type for the books he intended printing, and the type is now known as the Village type. His first book was "Printing," an essay by William Morris and Emery Walker. It was a small quarto, bound in brown boards, and limited in number for copies for sale to 200. Morris's influence is plainly visible, both in the type and in the printer's mark. The second book was a 16 mo. edition of Rossetti's, "The Blessed Damozel," printed in December, 1903. It was printed on Japanese vellum, and bound in vellum. The third book and the last to bear the Park Ridge imprint, was Lamb's "Dissertation on Roast Pig," a 16 mo. issued in February, 1904. Goudy left Chicago, and became a travelling or a journeyman printer; he carried his press and types with him. He went to Hingham, Massachusetts. Here, in 1905, he printed a 12 mo edition of Kipling's poem, "The Gypsy Trail." When next we hear of the Village Press, it is from New York, where, in 1906, he opened activities with his hand press, with an edition of Bliss Carman's poem, "The Princess of the Tower," an octavo, bound in grey boards. This was followed the next year by an edition of the same writer's "The Gate of Peace," also an octavo, in grey boards. Then occurred the catastrophe of the destruction of the press by fire, in 1908.

A Hard Struggle.

It was three years before Goudy was in a position to re-establish his little shop, but he succeeded in 1911, when he issued Bliss Carman's "Address at Moonshine," early in that year, and the "Songs and Verses" by Waller, in March. It was a hard struggle to make both ends meet in the Goudy household, for there were no profits to be gained by selling Village Press books. But Goudy's genius and devotion to his art found an appreciative patron in Mr. Mitchell Kennerley, and that amateur of books, amateur in the highest sense of the word, gave Goudy his opportunity. Mr. Kennerley commissioned Goudy to design an entirely new fount of type for him, to be used for the printing of books, and a new lettering for display setting for the magazine which Mr. Kennerley was then publishing. To this commission the world is indebted for the Kennerley and Forum types. It is no exaggeration to say that not since the days of William Caslon has a new type found such wide appreciation as the Kennerley type has found. It is the one type of pure American invention which the printers of England have accepted and are using now for some of their best printing.

Fine Printing and Authorship.

With the peace of mind that came to Goudy from freedom from want, came a fresh impetus to the Village Press. In 1913 there proceeded from its little office a small edition of Le Gallienne's account of "Good Bishop Valentine," printed from Miss Belle Da Costa Greene. In 1914 Mr. John Quinn, the well-known lawyer and book-collector, ordered for himself an edition of "Nine Poems, by W. B. Yeats." In 1915 Goudy printed for himself Wither's "Christmas Caroll," and in 1918, for Mr. Kennerley, the "Note on the Bridgewater House Library." In 1919 there were printed two pieces, one a brochure of Bernard Shaw's "The Great Fight," from Cashel Byron's Profession, and the other a folio edition of "The Song of Songs," in double columns. In 1918 he had set up the first edition of his own book, "The Alphabet," published by Mitchell Kennerley, and this has since been followed by its companion on the "Elements of Lettering," printed in 1922, for the same publisher. The only other book from the Village Press done by Goudy for himself, since 1919, was an edition of John Hall's poem, "The Goodly Doctrine."

The most beautiful of all the work done by this press, though the book is not a Village Press book, is the magnificent edition of H. G. Wells' "The Hole in the Wall." This fine folio is a monument to the splendid composing ability of Mrs. Goudy, without whose aid Goudy would have found his task as a printer almost impossible to accomplish single-handed. I know of no book of modern manufacture so charged with that taste which makes a thing of beauty a joy for ever. Before concluding this list, I should like to mention also, a small edition of Le Gallienne's "Open Letter to Laurence Gomme," which was printed at Forest Hills, in 1915, where the press was then established, and a most beautiful sheet— a folio broadside of "The Oath of Hippocrates."

Goudy is now again about to wander, and again he is taking with him his press and types. But he is to settle down now, he thinks, for good and all, in a little place near the foothills of the Catskills. New York City will see him only occasionally, but it will hear from him often. He is about to set up a permanent home for his press and his type designing plant, in the village of Marlborough, so that the Village Press will be in a real village, and be a fact, indeed, as well as in name. May it prosper long!

Prolific Type Designing.

The work so far catalogued would seem to be a sufficient achievement for one man to merit high acknowledgment but the Village Press is but part, and the lesser part, of the sum of Goudy's labours. It is not as a printer, but as a designer of type, that

---

An Address by Temple Scott before the American Institute of Graphic Arts.

Digitized by Google

Goudy's name will go down in history, and the amount of work done by him in this field is simply astounding. In the annals of the printer's craft there is not another man who has achieved the body work Goudy has done. Where Jenson or Garamond or Caslon or Baskerville can be credited with one or two or three types, Goudy must be credited with dozens. And every one of these types is distinguished for qualities which we accept as most desirable. Whether it be the "Village" or the "Goudy" or the "Kennerley" or the "Goudy Old Style," or the "Italian Old Style," or the "Garamont" or the "Collier," each has a beauty of its own, and each is a special contribution to the printer's art. William Morris made a reputation with two type faces, and Ricketts and Cobden-Sanderson with one type face each but Goudy submits as his claim for appreciation no less than forty-five. Is it any wonder that even in our democracy such a wealth of service could not pass unnoticed, and that he has been awarded the Architect's gold medal. So remarkable an output of one individual is in itself worthy of note, for it argues a power of energy that takes no regard of anything other than its own dynamic quality. It is a characteristic of democracy that it tends to standardise the individual. Goudy has opposed this standardising force with the power of his genius. That is something to remember when we come to estimate this man's worth. For it marks him out as an extraordinary man in an extraordinary sense. He has dared where others would have compromised, and it is as much for his daring and courage as for his work that I think so much of the man, for that daring has never been expressed rudely or obtrusively. On the contrary, it has always been felt as coming from one who has that humility of heart which only those possess who have also greatness of mind. It arises from his utter devotion to his inspiration, and from his simple, sincere desire to do the best that it is in him to do. He exemplifies in an unusual modern way the ancient wisdom of the Brahmin, which tells us to:

Devoutly look, and naught
But wonders shall pass by thee;
Devoutly read, and then
All books shall edify thee;
Devoutly speak, and men
Devoutly listen to thee;
Devoutly act, and then
The strength of God shall act through thee.

I am altogether convinced that Goudy has done the work he did because of this devotion of the spirit in him.

Swiss Import Regulations.

The "Recueil des Lois Fédérales" for July 25th contains a Decree of the Swiss Federal Council and a Decision of the Federal Department of Public Economy, both dated July 18th, and effective as from July 25th, which modify the import prohibitions in force in Switzerland.

A General Licence has been accorded for the importation over all frontiers of the following:—Pasteboard covered with paper of a natural colour (Tariff No. 310); albums for pictures and post cards (Tariff No. 338a).

L&M

LITHO ROTARIES

THE PRESSES WITH SPECIAL FEATURES.

THESE LITHO ROTARIES have now been in use for many years, and have fully demonstrated their value to practical printers on all classes of work. When designing and developing these presses, our engineering experts collaborated with practical printers in order to give to the lithographic trade the best machines for direct and offset printing.

We especially invite those houses who at present are engaged solely in letterpress printing. and are considering the possibilities of litho machinery in their own business, particularly offset printing. to permit us to advise them in the matter. We shall be pleased to arrange for one of our experts to discuss the matter with any printer who writes us accordingly.

General printers who intend to extend their lithographic departments by installing Litho Rotary Presses should send for full details of the

Paper Prices and Prospects.

Mr. G. R. Hall Caine, M.P., on his Canadian Visit.

Mr. G. R. Hall Caine, M.P., has returned to London from an extended visit to Canada, and he brings over the latest information concerning the pulp and paper situation on the other side of the Atlantic. His visit to the Dominion was undertaken, of course, in connection with certain undertakings of Messrs. Becker and Co. With regard to these matters, the only information he is able to give is that substantial progress has been made.

Strong Paper Market.

Mr. Hall Caine described the paper market as he found it as very strong.

"It is true that the price of news print has gone up, and is maintained at about 75 dollars a short ton at the mill. That price, however, is a tactical one, and is maintained for strong tactical reasons by the large manufacturers. The point is this: papermakers have sounded the market pretty well, and have come to the conclusion that 75 dollars is the highest price that the consumer can pay and at the same time maintain the consumption.

"Some few weeks before I arrived, and during the early period I was there, a good many conferences took place between the newspaper publishers and the papermakers, and the argument of the papermakers was that they ought to get a few dollars more per ton, seeing that the demand had been so great, while production had not been sufficient to meet the demand. It was quite well known that a certain quantity of paper was coming from Scandinavia and from Germany in order to meet the consumption. While certain of the paper manufacturers felt they might get a dollar or two more, they saw they were going to be right 'up against it' if they put up the price, because the publishers contended that 75 dollars was the highest price which they could economically pay, and at the same time continue the sizes of their newspapers. Their reply to the argument of the manufacturers was that they would cut down their sizes by 4, 8 or 12 pages, which they were quite able to do, of course, on account of the enormous dimensions of their publications. Accordingly, the papermakers came to the conclusion that it was better to keep the mills running at 100 per cent. and take 75 dollars than attempt to get 77 or 80 dollars and run the grave risk of a lessened demand.

"Personally, I think they acted very wisely, because at $75 there was a very fair margin of profit."

Demand for News-Print.

Asked if he could indicate the future course of paper business, Mr. Hall Caine said he was interviewed by a number of gentlemen of various provincial and other newspapers in Montreal, who were all extremely desirous of seeing export of Canadian news-print to this country; but he endeavoured to convince them that with such a market as they had over the border, any attempt to compete in this country, with all its difficulties--difficulties of variations in sizes of rolls, difficulties of storage, difficulties of transport—was not really worth worrying about.

"The papermakers I have spoken to," said Mr. Hall Caine, "some of them the largest in their line, have definitely abandoned for the time being any thought of trying to send news print paper into England in any considerable quantities.

"The Canadians have standardised machines and make a standard roll; they have all the market they want in the United States and are running at 100 per cent. So the only object of attempting to establish a market here would be by way of insurance, so that they should not have all their eggs in one basket. But, as a matter of fact, the United States basket is so large that it almost becomes half-a-dozen baskets in itself. The consumption of paper there is so tremendous, that the consumption in the United Kingdom falls into insignificance when compared with it.

"A friend of mine who was a buyer for one of the largest publishers in New York, and who last year bought 217,000 tons of paper, is this year placing orders for 235,000 tons, mostly news-print. When you consider that the total consumption of news-print in this country is 600,000 tons, and that one American alone is ordering about half this quantity, it will give you some idea of the vast consumption of paper in the United States. Apart from that, new uses for paper are being invented every day. Therefore, I fail to see there is any menace from Canada so far as the paper trade of this country is concerned.

"On the other hand, I think there is a market, if we care to avail ourselves of it, in the United States, for British paper. For instance, I was offered a contract for ten thousand tons a few days before I left New York, but I was unable to take it, not on account of the price, which was a fair one, but because of the difficulties of delivery.

"I do not think the Canadians are worrying at all about export. There are 15 machines that I know of that are going down within the next few months in Canada and the States, and before they are installed the consumption of more than half of them is already disposed of.

"There was only one man during the whole of my stay in Canada who offered me paper for the English market, and this referred to a small over-supply which could be conveniently shipped."

Explaining the depression which has recently been felt in the paper market, Mr. Hall Caine observed that there was always a dull market at this time of the year.

"I am not unduly depressed," he observed, "by the dullness in July and August. As long as I can remember, there has always been a dull July and a particularly quiet August. We naturally feel it the more this year because we had not such a boom in the early months as we ought to have had. We are, therefore, experiencing a depression on the top of a semi-depression; but it does not mean that the whole bottom has fallen out of the market. I am pleased to see that esparto papers particularly are holding their own so well."

Postage on Paper Samples.

Further letters have appeared in *The Times* concerning the postage rates on paper samples.

Mr. W. Townsend, hon. treasurer of the South-Western Alliance of Master Printers, Exeter, writes: "The Post Office lays down that when its regulations state that printed paper is a sample it is no longer printed paper. To show the absurdity of this, if a stationer advertises the prices of his papers it is a price list, but if he states that the price list is printed on one of the actual papers quoted it becomes a sample, and therefore, according to the regulations, must be sent at letter rate. The regulations for foreign and colonial post do not contain these restrictions, and 'printed paper' is always printed paper without any qualifications, whereas for inland post there are many annoying restrictions."

A different line is taken by Mr. Sidney James, Nottingham, who says: "I am directly interested in the printing trade; but in spite of that I can hardly reconcile myself to the principle that makes fish of one trade and fowl of another. Surely the printing and paper trades generally are not so selfish as to wish to take an unfair advantage over other sections of the community by seeking a privilege, through the particular class of goods they handle, that it would be impossible to grant to all other trades, who would, providing the exception was made in favour of the paper and allied trades, be perfectly justified in demanding it. I cannot help feeling this must be the opinion held by the Post Office authorities."

Adhesive Tapes.

An excellent list, to be extended shortly, of adhesive tapes emanates from the manufacturing firm of Messrs. Millington and Sheldrick, Ltd., 19, Altrincham-street, London-road, Manchester. There is a growing use for the sealing of parcels by adhesive paper tapes, not only in the matter of security, but because the method is so widely adaptable and easy of application, and parcels are given a neatness not otherwise secured. The series of adhesive tapes put on the market by Messrs. Millington and Sheldrick bear the registered names of "Trasoid" and "Sulphinoid." The specimens before us bear distinctive numbers, are supplied in a variety of colours and in any width from three-sixteenths of an inch upwards.

Trade Notes.

PARTNERSHIP has been dissolved between A. R. Greenfield the Younger, S.J. Greenfield, and H. W. Greenfield, lithographers, engravers and printers, 140, Great Dover-street, London, S.E.1, and Durham-road, Laindon, Essex, under the style of Smith, Greenfield and Co., so far as regards H. W. Greenfield; also between A. H. Bell, W. J. Stratton and H. Ivill, printers and publishers, 26A, High-street, Eastleigh, Southampton, under the style of the Eastleigh Printing Works, and publishers of the *Eastleigh Weekly News*; W. J. Fishleigh and W. J. Lockett, pattern bunch makers, printers and relief stampers, 15, Hill-street, Finsbury, E.C.2, under the style of The Victor Pattern Card Co.

MESSRS. FRANK ULLMER, LTD., are transferring the recently-purchased plant and equipment of Messrs. John Meerloo and Sons' Walthamstow factory to their premises in Great Saffron-hill, E.C. They have just installed two special rotary wood-cutting machines.

THE St. Stephen's Press, of Bristol, is the subject of an illustrated article in last Thursday's *Bristol Times and Mirror*. The activities of this firm cover a wide field, and recent developments include facilities for photo-litho offset work.

THE first meeting of the Federation of Master Printers' committee appointed to investigate the question of co operative advertising for the printing industry will take place on September 4th. Each of the Federation's Alliances has been asked to nominate to this committee members particularly interested in the subject.

THE appeal made by the Federation of Master Printers to its members on behalf of the War Orphan Fund of the Printers' Pension Corporation is meeting with satisfactory response. A donation of 100 guineas has been made by one large firm which has works in London and the provinces, with a promise of an annual subscription of £25 for the next five years, if such support is required. In addition this same firm is assisting practically all the widows with young children of its employees killed in the War.

THE next meeting of the Joint Committee of the Federation of Master Printers and the National Association of Wholesale Stationers and Paper Merchants is fixed for September 11th, at 11, King's Bench-walk, when further points of detail in regard to direct trading will be discussed.

THE employees of the Record Composition Co., Ltd., had their ninth annual outing on Saturday, August 18th, when they journeyed by charabanc to Lamberhurst, Kent. A cricket match in the afternoon (Lino Department *v.* Mono Department) ended in a victory for the former. A very enjoyable day was spent.

THE London School of Printing is to be congratulated upon the remarkably laudatory comments which the School's "Year Book" has elicited from the daily Press.

THE L.C.C. London School of Printing and Kindred Trades, Stamford-street, S.E.1, is forming a special course for buyers and users of paper. The classes will be held on Thursday evenings from September to April and will be under the direction of Mr. E. A. Dawe. Lectures, testing, analysis and laboratory work will comprise the course, and the syllabus ranges from the raw materials to the manufacture and handling of the finished article.

WE have received a copy of the new prospectus and time-table of the L.C.C. Central School of Arts and Crafts, Southampton-row, which continues its excellent courses of instruction in the various subjects appertaining to book production. The autumn term commences on September 24th.

CITY AND GUILDS EXAMINATIONS.—The programme has been issued for the session 1923-4 of the Department of Technology of the City and Guilds of London Institute. This gives syllabuses for examinations in technological subjects, including typography, lithography, bookbinding and paper manufacture.

PAPERMAKING CLASSES.—Bolt Court School, L.C.C., with 13 firsts and 3 seconds, has again secured the distinction of heading the list of City and Guilds papermaking successes. Dartford and Maidstone were responsible for 37 of the 84 successful students. Much of the success gained is due to the efforts of Mr. A. A. Whalley, the lecturer.

THE Hants Royal Garrison Artillery, commanded by Major W. H. Barrell, O.B.E., T.D., who is chairman of the Home Counties Master Printers' Alliance, have for the fourth year in succession won the King's Cup in competition open to coastal batteries.

MANY well-known men in the journalistic world are expected to be present at the Institute of Journalists' Conference, to be held at Harrogate next month.

THE members of the North-Eastern District of the Institute of Journalists met in Newcastle, on Saturday night, under the chairmanship of Mr. Thos. S. Fenwick, to discuss the agenda of the forthcoming conference of the Institute at Harrogate.

THE death has occurred at Edinburgh of Mr. Alexander Baxter, of Messrs. John Baxter and Son, printers.

MR. W. HENRY RICHARDS (44), chief sub-editor of the *Leeds Mercury*, was descending the cliffs at Langland Bay, near Swansea, on Monday afternoon, to join his wife and a party of friends, when he missed his footing and fell a distance of 60 feet. He received fatal injuries, and died in the evening in Swansea Hospital without recovering consciousness.

THE death has occurred at Bridport of Mr. Michael A. Morrison, for many years resident correspondent at Berlin for the *Daily Chronicle*.

THE late Mr. Arthur William Dean, of Great Earl-street, Holborn, wholesale stationer, who died July 5th, left £24,312.

THE late Mr. William Michael Murphy, of Mount Pleasant, Liverpool, book dealer, left £6,763.

LANCS PAPER TRADE GOLF SOCIETY.—The autumn competition will take place on Monday, September 10th, on the links of the Pleasington Golf Club, Pleasington, near Blackburn, which have kindly been lent for the occasion by the Club Committee. Entry forms should be in the hands of the secretary, Mr. H. Hollows, 144, Princess-street, Manchester, not later than September 3rd. A copy of the draw and times of starting will be posted on to competitors two or three days before the date of the competition.

PRESIDENT COOLIDGE has approved of the issue of a two cent Harding memorial postage stamp.

THE *Bookseller and Stationer*, of New York, announces that with its issue of August 15th it ceases publication. We understand, however, that the journal's activities may later be resumed in some other way.

COMPLAINT is made in the United States that no official decision of standard newsprint paper has yet been made public by the Customs Service, in spite of the fact that the definition has been hanging fire ever since the present tariff act became operative.

THE Richter printing establishment at Naples, where securities and notes for the banks of Naples and Sicily were printed, is reported to have been destroyed by fire, the damage amounting to several millions, though the most valuable parcels were rescued.

BOOKS, in 100 kilos., imported into Germany during the first quarter of the year reached 2,196, as against 3,792 in the corresponding period last year.

PRINTED books, in 100 kilos., imported into Switzerland during January to March reached 5,780 (valued at 1,507,000 francs). This figure compares with 7,320 (2,041,000 francs) in the corresponding period last year, and 5,499 (2,092,000 francs) during January to March, 1921.

BOOKS, pictures, etc., exported from France during the first quarter of the year amounted, in 100 kilos., to 31,007, compared with 35,812 last year and 24,334 in the corresponding period of 1921.

BOOKS and other printed matter exported from Spain during 1922 reached 552 tonnes (of the value of 2,311,000 pesetas), as against 1,148 tonnes (4,812,000 pesetas) in 1921. [Peseta = 9·6d., or 25 to the £.]

UNDER the Treaty of Commerce between the United Kingdom and Czecho Slovakia the quantities of goods produced in British territories which will be admitted into the Republic include 125 tons of "paper for special purposes and paper manufactures."

LITHUANIA.—H.M. Consul at Kovno reports that the export duties on timber for the manufacture of wood pulp have been doubled.

Trade Union Matters.

STEREOTYPERS AND COMPOSITORS AT VARIANCE.—The Executive Council of the Typographical Association have received a report of a conference held to adjust the dispute between the Association and the Stereotypers' Society on the mounting of plates. The stereotypers urged that compositors were doing the work of their members, but were willing to admit T.A. members doing such work into their society by payment of a nominal sum per week. The T.A. claimed that the mounting of plates on Parker boards was the work of T.A. members. The stereotypers did not claim the work of imposing plates on shutters where they were mounted by patent clip blocks, but when plates were nailed or screwed, either singly or on boards, they claimed the work. The T.A. representatives agreed to make a full inquiry into the methods of doing this work, and to report to the Executive Council that the stereotypers only claimed work done in the foundry. The conference was held under the auspices of the P. and K.T. Federation, with the Right Hon. C. W. Bowerman presiding.

TYPOGRAPHICAL ASSOCIATION AND WAGES MAINTENANCE.—The Executive Council of the T.A. have had submitted to them resolutions from various groups and branches recommending a ballot of the membership on the question of a weekly levy to create an adequate fund for the purpose of maintaining the standard of wages and hours now in force. The Council have decided to take a ballot of the members on a proposal for a levy of 1s. per week for a period of twelve months.

A PHOTOGRAPH of Mr. F. E. Stanley, who died on April 20th last, aged 45, was unveiled on Friday in the offices of the Birmingham branch of the Printing, Bookbinding, Machine Ruling and Paper Workers' Union, in recognition of his services to that organisation. During his 22 years' association with the society he had held office as president, and aided several amalgamations of a national character.

MR. C. J. BUNDOCK, formerly editor of the *Leicester Pioneer*, has been appointed organiser for the National Union of Journalists, and will take up his duties at the beginning of September.

Joint Industrial Council Sports.

Successful Meeting at St. Albans.

Favoured with fine weather and enjoying the enthusiastic support of both employers and employed, the sports held at St. Albans on Saturday by the County of Hertford District Committee of the Joint Industrial Council proved a brilliant success.

The meeting took place in the St. Albans School Sports Field, where a large company gathered to watch the competitive events, and to take part in the other entertainments provided. In the unavoidable absence of Mr. F. Dangerfield, Mr. David Greenhill acted as chairman of the day's proceedings. The judges were Major Harrison (Chief Constable of St. Albans City), Messrs. Joyner and W. G Eade. The arrangements were admirable throughout, reflecting the utmost credit upon the committee under the chairmanship of Mr. Gordon Fisher, and upon the hard-working secretary, Mr. Martin H. Jenkins, together with the many others who co-operated to ensure the success of the effort.

There were many handsome prizes, and the various events were keenly contested. The following are a few of the results:—

Tug of War.—Sun Engraving Co., Ltd.

75 Yards, Veterans' Handicap.—R. Collins (Gibbs and Bamforth, Ltd.), 1; A. Bolton (Campfield Press), 2.

100 Yards Handicap, Youths under 18.—L. F. Ludwick (A. G. Bennett and Co., Letchworth), 1; A. J. Fisher (Campfield Press), 2; W. G. Weatherly (Dickinson's, Apsley), 3.

75 Yards, Girls.—F. E. Pearce (Waterlow's), 1; G. Heath (Waterlow's), 2; A. A. Renwick (Campfield Press), 3.

The "Boot Race" was a novel and interesting item. Each competitor was required to surrender one of his boots, and all boots were then placed in a sack. Competitors had to run 50 yards, take their boots from the sack, put them on, lace them up properly and run back to the start. The first prize went to J. A. McCormick (*Herts Advertiser*), the second to A. J. Fisher (Campfield Press), and the third to Harold Quick (J. W. Vernon and Co.).

In the course of the afternoon tea was delightfully served on the grounds, after which a little appropriate speechifying was indulged in.

Mr. Greenhill mentioned that this was the first County Joint District Committee to be formed in connection with the Joint Industrial Council and that there were sub-committees for the different centres of the county. He made an earnest appeal that these new developments should be given the cordial support of every member of the trade, employer or employed. He welcomed the presence with them of Mr. H. A. Bethell, chairman of the Organisation Committee of the J.I.C. who had come down specially from Manchester for the occasion.

Mr. Bethell also spoke, and in the course of his remarks expressed his great pleasure at the success of the meeting, which he said was the biggest thing of the kind he had seen.

Another speaker was Mr. A. E. Goodwin, joint secretary of the J.I.C., who had returned from holiday in order to be present. He referred to the many ways in which a district committee can serve the craft, and congratulated those responsible for the excellent arrangements which had been made for that day. He also threw out several suggestions for future activities, amongst which was the idea of providing a holiday home for local members of the craft.

It had been hoped that Mr. A. E. Holmes, joint secretary, would be present, but he was fulfilling an engagement at the Herne Hill Sports, and in his absence Mr. Marchant Warrell of the National Society of Operative Printers and Assistants urged the claims of the movement upon all workers in the county.

Mr. Greenhill then referred to the position of the Printers' Pension Corporation War Orphan Fund, and stated that there were 14 of these orphans in the county of Herts. He asked the meeting to pass a resolution recording that the Herts Joint District Committee of the J.I.C. undertook to make itself responsible for the maintenance of these orphans. This was seconded by Mr. E. G. Yates, J.P., group secretary of the Home Counties and South-Eastern Group of the T.A., and was carried most enthusiastically.

When, after tea, the prizes had been graciously presented by Mrs. F. Dangerfield, votes of thanks were passed to those who had kindly given their aid, and afterwards there was dancing on the green and a number of side shows and entertainments, including a demonstration of wireless. For the dancing, and during the day, the St. Albans British Legion Military Band rendered excellent service.

The break-up of the gathering left the memory of a very happy afternoon, which marks a further step in the development of goodwill throughout the printing industry.

Printing, Bookbinding, Machine RULING AND PAPER WORKERS.

Sports Gathering and Gala Day.

The second annual union gala day and sports gathering of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers was held on Saturday at the Herne Hill Track, London, S.E. Favourable weather accompanied the proceedings, which added to an attractive programme consisting of twenty-seven events combined to draw together a large attendance.

Mr. A. McLeod (the hon. sports secretary), in co-operation with the officials and stewards managed the arrangements in a very creditable manner. Among well-known representatives of the "big four" present, and others identified with the industry, were the following: Messrs. T. G. Newland, A. E. Holmes, G. F. Larcey, H. Chalk, E. W. Spackman, C. H. Gordon and J. Fleming.

Apart from the more important events, the programme contained a number of interesting features in the way of races for members' children, a pipe and tobacco race, balloon and egg and spoon races, etc., all of which were much enjoyed.

Principal Results.

The awards in the principal events went to the following competitors:—

100 YARDS TRADE HANDICAP.—L. J Booker, 1; R. S. Hall, 2; J. Wooley, 3.

100 YARDS APPRENTICES AND BOYS' HANDICAP.—J. Fell, 1; S. Hollingdale, 2; T. G. W. Benjamin, 3.

80 YARDS VETERANS' HANDICAP.—J. Wooley, 1; J. Bryce, 2; T. G. Benjamin, 3.

ONE MILE CYCLE CHAMPIONSHIP.—E. J. Kerridge, 1; A. J. Wood, 2; W. E. Neal, 3.

SHOPS TUG OF-WAR CHAMPIONSHIP.—Won by Burn's Royal Mills, Esher, who defeated W. H. Smith and Son (news department) by two straight pulls.

ONE MILE WALKING CHAMPIONSHIP.—C. W. Fear, 1; W. J. Roos, 2; T. Moore, 3.

SHOPS' RELAY TRADE CHAMPIONSHIP (Women).—Bains, 1; Burn's Royal Mills (Esher), 2; Greycaine Bookbinding Co., 3.

ONE MILE HANDICAP (OPEN).—R. J. Wade, 1; C. J. Munro, 2; T. F. Russell, 3.

440 YARDS' WALK (WOMEN).—Miss G. Kingsland (Fleetway Press), 1; Miss H. Smith (Greycaine Bookbinding Co.), 2.

440 YARDS OBSTACLE RACE (MEN).—W. Birch, 1; T. E. Williamson, 2; H. Elkington, 3.

SHOPS' RELAY ONE MILE CHAMPIONSHIP (MEN).—W. H. Smith and Son, 1; Cassell and Co., 2; Millington and Sons, 3.

440 YARDS HANDICAP (MEN).—R. S. Hall, 1; T. W. Woodman, 2; R. W. Best, 3.

ONE MILE CHAMPIONSHIP (MEN).—J. H. Fletcher, 1; P. F. Goodyer, 2; A. J. Smith, 3.

The prizes were presented by Mrs. T. G. Newland.

A detachment of No. 68 (City of London) Division (Printers' Own) St. John Ambulance Brigade, under Ambulance Officer C. H. Peters, was in attendance, but there were fortunately no serious casualties to make demands on their skill.

At the conclusion of the sports a dance programme was enjoyed, at which the new band of the N.U.P.B.M.R. and Paper Workers rendered excellent service.

The profits accruing from the sports are in aid of the Paper Workers' Home at Carshalton, the Printers' Medical Aid and the Bookbinders' Cottage Homes.

A NEW process for converting wheat and oat straw into paper, and one which, in the opinion of experts, promises to revolutionise the papermaking industry, has been invented by Mr. Charles Weygang, of Maidenhead, who is an authority on the treatment of fibrous materials in the manufacture of paper.

Miss L. Hudson.

The Council and subscribers of the Printers' Pension Corporation have sustained a severe loss by the passing away of Miss Lillie Hudson, for many years assistant secretary of the Corporation. Her death occurred after a brief illness, on Friday August 17th. A lady by birth and education she was pre-eminently fitted for the post she occupied with such marked distinction for nearly twenty years; while the faithfulness and devotion she manifested in the work of the Corporation won for her the confidence and admiration of all with whom she came in contact. The memory of her strenuous labours will remain a lasting inspiration to others, who will take up the task she has laid down. The last rites were reverently performed on Wednesday, August 22nd, at St. Pancras Cemetery, Finchley. Among those present, in addition to members of the family, were Mr. Joseph Mortimer, Mr. W. H. Christopher, Mr. A. Shurey, and all the deceased lady's colleagues at the office. The Council were also represented by Mr. W. E. Hebditch, Mr. F. P. Lewington, Mr. F. Fountain and Mr. W. Vandy.—W. V.

Mr. William Mattocks.

We regret to announce the sudden death last week of Mr. William Mattocks, of Messrs Cannops and Sons, Coventry. The end came with tragic unexpectedness, as Mr. Mattocks was apparently in good health until Tuesday of last week, when he suddenly collapsed and died from cerebral hæmorrhage. A comparatively young man, 50 years of age, he took an active interest in the local employers' organisation, being a useful member of the Coventry Master Printers' Association. At the funeral, which took place on Saturday, the Coventry Master Printers' Association was well represented, and Mr. A. E. Feltham attended on behalf of the Council of the Federation of Master Printers and the Executive of the Midland Alliance of Master Printers.

Russian Book Supplies.

The Russian Central Book Department has been in existence since 1920 as a section of the State Publishing Agency.

Its objects are: (1) To receive direct from all printing works twenty-five copies of all books and journals published on Union territory; nine copies of all newspapers, music, and leaflets not over two pages in size; and their distribution amongst the principal libraries of the Union. (2) The bibliographic description in the fortnightly *Knizhnaya Letopis*, published by the department, of all new publications. (3) Storage in its archives, which are open to students.

The Book Department, says *Russian Information and Review*, is open to enter into agreement with foreign institutions, receiving from them definite quantities of foreign publications as required, and placing at their disposal definite publications required abroad, from the scientific fund placed at its disposal by the Board of Learning and the State Publishing Agency. Such exchanges may be operated per volume, work, or page, as may be settled in each individual case, but always without monetary transactions. As the Book Department is at the centre of all book-production in Russia and can give information in the shortest possible time, as well as actually ship most of the publications required, such an arrangement must be of interest to learned institutions and publishers abroad, as well as being convenient to corresponding organisations in Russia.

Inquiries on this subject should be addressed to the Official Agent of the R.S.F.S.R., 128, New Bond-street, London, W.1., or may be sent direct to the Central Book Department, Tverskaya 48, Moscow.

GREAT efforts are being made to save the *Daily Herald* between now and September 6th, when the Trades Union Congress will be asked to consider the question of its discontinuance from September 30th.

INDUSTRY is the mother of good luck.

Digitized by Google

"PHOTOGRAPHY AS A SCIENTIFIC IMPLEMENT." London: Blackie and Son, Ltd., 50, Old Bailey, E.C. 30s. net.

Photography is nowadays becoming so interwoven with many of our industrial processes, and is establishing itself as a necessary aid in scientific investigations in such a way that a knowledge of the art, both theoretical and technical, is indispensable to all who wish to keep abreast of progress in their varied professions. In this volume the publishers have gathered together a mass of information relating to the art, and the various phases are dealt with by no less than a dozen writers. The "History of Photography" is written up by Charles R. Gibson, F.R.S.E.; the "Elementary Optics of Photography" by S. E. Sheppard, D.Sc.; "Photographic Optics" by A. E. Conrady, A.R.C.S.; "The Theory of Photographic Processes and Methods" by S. E. Sheppard, D.Sc.; "The Application of Photography in Physics" by H. Moss, D.Sc. (Lond.), A.R.C.R., D.I.C.; "Photography in the Engineering and Metallurgical Industries" by John Henry G. Monypenny; "Astronomical Photography" by Charles Rundle Davidson, F.R.A.S.; "Photomicrography" by George H. Rodman, M.D., F.R.P.S.; "Photographic Surveying" by Colonel H. S. L. Winterbotham, C.M.G., D.S.O.; "Aeronautical Photography" by F. C. V. Laws, O.B.E., F.R.P.S., R.A.F.; "Colour Photography" by W. L. F. Wastell, F.R.P.S.; "Photography Applied to Printing" by William B. Hislop; "The Technics of Kinematography" by Arthur S. Newman, and the "Camera as Witness and Detective" by Wilfred Mark Webb, F.L.S., F.R.M.S. These names are sufficient guarantee that the branches of the subject are dealt with in a thorough manner, each writer being a specialist in the section of photography with which he deals. The chapter on "Photography as Applied to Printing" is one that should appeal to our readers. The writer, Mr. Hislop, is a gentleman who holds the position of lecturer on photo-process work at the Heriot-Watt College, Edinburgh, and is also examiner to the London City and Guilds Institute. Mr. Hislop deals with line and half-tone work, collotype, photogravure and other reproductive methods in a clear and concise manner, and his remarks on the three colour process should give readers an insight into the possibilities of that rather intricate method of illustration. An appendix to the chapter gives up-to-date formulæ for the various processes dealt with. The chapter on "Colour Photography" will also give much information of a theoretical character that will be useful to the worker in three-colour methods. The book is a valuable contribution to photographic literature.

"HOFMANN'S PRACTICAL HANDBOOK OF PAPER-MAKING." Published by Carl Hofmann G.m.b.H. Berlin, S.W.11.

The third edition of this well-known work is now being issued in German, and the third volume entitled "Leimen, Fullen, Farben des Papierstoffs"—"Sizing, Loading and Dyeing Paper Pulps"—now lies before us, bound in blue paper boards with cloth back and white lettering. It is printed on a white super-calendered sulphite paper, and offers a considerable contrast to the handsome volumes of the first and second editions on our book shelf, but the printing is clear and the illustrations are adequate.

The matter itself has been entirely re-written, the sizing and loading section by the careful hand of Dr. Rudolf Sieber, and the dyeing section by H. Dierdorf of Ludwigshaven.

Although the whole volume of 124 large pages is some 60 pages less than in the second edition the text is closer and the matter is brought right up to date.

Sizing is one of the most important, and, till recently, one of the least understood processes in papermaking. Dr. Sieber has, himself, done much towards its elucidation, and in this work he treats the subject very fully, both scientifically and from the practical standpoint.

The subject of loading is treated in an equally systematic manner, particular attention being devoted to the yields under varying circumstances. Dyeing is carefully dealt with and many useful directions for the economical and certain use of the coal tar dyestuffs are given. The whole is illustrated by six sheets of excellent dyed samples.

Like the former editions, this one is sure to find a place in every papermaker's library.—J. M. A.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies, Machinery for Sale and Wanted, Businesses for Sale and Wanted, Partnerships and Investments, Miscellaneous.

One Insertion **3/0**
Three Insertions **6/0**
For every line exceeding three lines **1/.**

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion **1/6**
Three Insertions **3/0**
For every line exceeding three lines **6d**

Sales by Auctions, Tenders, Patents for Sale, Legal and Financial Announcements

Per line **1/0**

American News-Print.

Statistics for June.

All of the 60 reporting companies produced 242,524 tons and shipped 241,220 tons during June. Production exceeded shipments by 1,304 tons. Production figures include 2,584 tons of hanging, of which 318 tons were made in Canada.

The average daily production of newsprint paper by the 50 identical mills reporting for June amounted to 101·7 per cent. of the average daily output during the three months of greatest production in 1922, with allowances for changes in machines.

Comparing production of the 50 companies reporting identically during the first six months of 1923 with that of the same period of 1922, the United States companies show an increase of 73,415 tons, or 12 per cent., the Canadian companies an increase of 105,391 tons, or 20 per cent., and the total of all these companies shows an increase of 178,806 tons, or 16 per cent.

Stocks of the same companies during June increased 1,163 tons at mill points in the United States and decreased 72 tons in Canada. Total stocks of these reporting mills amounted to 30,775 tons, or 1,091 tons more on Jun 30th than on May 31st. These stocks were equivalent to 3·6 days' average production, about 20 per cent. of which was at British Columbia mills that ship by water.

ABOUT the only thing the something-for-nothing seeker gets is a lot of costly experience.

The Mexican Market.

Rapid Development of German Sales of Paper.

Vice-Consul Evans, at Mexico City, has forwarded the following report to the Department of Commerce, Washington, D.C.:—

"An analysis of statistics during the first four months of 1923, as compared with the previous two years, would seem to warrant the conclusion that the rapid development of German paper sales in Mexico during the months of January to April this year have been realised at the expense of American paper exporters, who furnished the Mexican market with 66 per cent. of its requirements in 1922, and with but 51 per cent. in the first four months of the current year. During the same period German imports have increased to 39 per cent. as compared with 17 per cent. in 1922. In fact, German paper imports during the period January-April represented nearly 80 per cent. of the imports from the same source during the preceding twelve months, and if entries continue at the same rate throughout the remaining eight months they will equal more than twice the entire sales for 1922.

"Imports of paper from Germany are said to be mainly of a cheap quality, and this report seems to be confirmed by the Customs valuation of 13 cents per kilo during the first four months of 1923, compared with 32 cents in 1922, and 20 cents in 1909-10. Imports from the United States during 1923 and the previous two years averaged approximately 30 cents, and increase of 8 cents per kilo over 1909-10. It is of significance to note in this connection that the Customs valuation of paper imports from Germany during 1923 have been one cent kilo lower than those of 1921, when considerable quantities of cheap German paper were dumped on the market at an average price of 14 cents per kilo, according to Customs valuation."

THURSDAY, AUGUST 30, 1923.

The "Daily Herald's" Crisis.

IT would appear that the *Daily Herald*, this country's only Labour newspaper, is now facing the greatest crisis that has yet marked its adventurous career. The crisis was made plain by the recent decision of the joint sub-committee of the general council of the Trades Union Congress and the National Executive of the Labour party "that the general council should be recommended to report to the Trades Union Congress, to be held at Plymouth next month, that in the opinion of the joint meeting publication of the *Daily Herald* should be discontinued after September 30th." The position is the more poignant in view of the recent brightening of the paper's outlook when the whole trade union movement decided to give its aid in keeping the *Herald* alive. As was fitting, because of the special interest which our own industry has in newspaper enterprise, trade union leaders in the printing trade have done much in aid of the Labour daily, and they are under no illusion as to the seriousness of the threatened demise. Says Mr. H. Skinner (general secretary of the Typographical Association): "If the *Daily Herald* stops, Labour will suffer the biggest blow inflicted in my time." And Mr. G. A. Isaacs (general secretary of the National Society of Operative Printers and Assistants,) remarks: "When we say good-bye to the *Daily Herald* we say good-bye to the prospects of a Labour Government."

* * *

Newspapers and Capital.

IN regard to complaints as to the amount of money sunk in the *Daily Herald*, Mr. George Lansbury replies vigorously: "How any intelligent person can be gulled by the lying innuendoes of the dope Press I do not understand. Every successful daily or weekly newspaper in the land, with a circulation, influence and position such as ours, has behind it money capital compared with which the relatively tiny sum invested in the *Daily Herald* is a mere drop in the ocean. When capitalists start a daily paper they count their capital by millions. The *Daily Herald* started with less than £300, and is, as the late Lord Northcliffe once said, 'the miracle of Fleet-street.'"

* * *

Can the "Herald" be Saved?

THE *Daily Herald's* position is by no means without hopeful features. Says Mr. Lansbury: "Our circulation, not half what it should be, is about two and a half times what it was this time last year. Our advertisement revenue is increasing: we have advance orders more important and valuable than ever before. Yet, under these circumstances we are under sentence of death, waiting the decision of an Appeal Court as to when and how we shall die. It seems incredible that such a condition of things should be possible." Mr. Lansbury remarks further: "Reason the matter out how I may, the one thought that persists is that, bad as things are, black as is the financial outlook for the trade unions, the outlook for the *Daily Herald* was never so bright as to-day. Any capitalist newspaper proprietor, looking at it solely from the commercial point of view, would, if he owned the paper, say: 'Now we are turning the corner; now is the time for a big push.'" Faced with this emminent tragedy to the Labour cause, strenuous eleventh-hour efforts are being made. May they not even yet be successful in giving the *Daily Herald* a new lease of life?

* * *

Railway Rates and Charges.

THE conduct of business concerns in these days is no easy matter. Hindrances arise both from without and within. While international problems disturb the markets of the world, difficulties at home act like grit in machinery. Although the dock strike is ended, there are the costs of transport still to be considered. Announcement is now made by the Registrar of the Railway Rates Tribunal that the four group companies have submitted their schedules of rates for the conveyance of merchandise, amounts of terminal charges, etc. Notice is given by order of the Court that any party interested and desiring to be heard at the consideration by the Court of these schedules of charges must lodge a written notice of objection with the Registrar by October 15th next.

* * *

Germany and Our Trade.

IN his report as chairman of the London Joint City and Midland Bank, early in the year, Mr. McKenna gave a very simple demonstration of this interdependence of trade, viz., taking our two largest customers in 1913, Germany and India, we sold to India goods value £70 millions, and received goods value £36 millions. To Germany we exported £41 millions, and imported £76 millions. India exported to Germany £27 millions, and imported goods value £7 millions. Our own deficit against Germany and surplus against India is approximately balanced in the end by India's surplus against Germany, which enables her to purchase extensively from us. With Germany's disintegration, some of our colonies have lost a good customer for raw materials which we cannot take.

* * *

Postal Rate Vagaries.

THE more we learn of the intricacies of the Postal Regulations the less we appear to know. It was commonly held that a registered letter, provided it was accepted by the Post Office, immediately became insured and guaranteed by that organisation. On a recent ruling that view is erroneous. Unless enclosed in an official registered envelope the P.O. does not carry the letter or packet under any liability. That is one thing. Now we

Digitized by Google

learn that a printed blotting slip advertising blotting is subject to a higher postal rate than a blotting slip which advertises writing paper. That is another thing. More recently still, after many months notice and the creation of a number of problems for envelope manufacturers the P.O. in its wisdom has acceded to the request to allow ordinary 6 in. by 3½ in. envelopes to go through the halfpenny post rate without coming under the category of trap envelopes. By this time there are millions of newly devised non-trap envelopes in this size ready for sales which will now be hard to find.

* * *

Some Old Paper Samples.

As an antidote to to-day's high paper prices, which are high only by comparison with the low rates that prevailed prior to the war, the reader would be well advised to peruse Richard Herring's "Varieties and Relative Values of Paper," an old volume of samples and prices which was issued in 1860. At that time the Excise Duty levied on paper was fixed at 14 guineas per ton, a little more than 1¼d. per lb. The tax was obnoxious enough, but the manner in which it was enacted and the various penalties enforced by law in cases of default were the greater burden. Every operation involved in sorting, counting, packing and labelling the reams had to be performed under the direct superveillance of the Excise officer. Among Herring's prices we note 1s. per lb. for printings, 7s. 11d. per ream for demy cap paper, £3 per ream for royal sugar blue, 16s. 2d. per ream for rope brown in 19½ ins. by 24 ins., 28 lbs. The commonest writing to be seen is a 9 lb. foolscap at 8s. 9d. per ream. The one outstanding feature of the whole collection of samples is that the coloured papers have not faded in any way and the range includes blues, greens, helios, pinks and azures.

* * *

Sources of Supply.

With reference to the countries sending printings and writings to the British market last month, the largest supplies came from Newfoundland, amounting to 164,547 cwts.; however, the quantity from this source indicates a decrease of 55,063 cwts. compared with July last year. The receipts under the classification mentioned from Sweden (47,229 cwts.) show a comparative increase of 20,391 cwts. While Germany's contribution rose from 7,523 cwts. to 12,401 cwts., the consignments from Norway, the United States, Canada and Belgium depreciated. With regard to the shipments of packings and wrappings, Sweden occupies premier position; supplies from that country in July of last year were 65,735 cwts. and 87,064 cwts. last month. Germany has also greatly strengthened her position on the British market, receipts from that country, which only amounted to 20,879 cwts. in July last year, reached the high figure of 83,257 cwts. last month. Slightly more of this class of paper has been received from Finland and Canada, while the arrivals from Norway and Belgium show declines.

* * *

Markets for British Paper.

Australia was again responsible for taking the largest quantity of British printings during the month, the supplies to that market (82,515 cwts.) recording an advance of 27,666 cwts. contrasted with July last year. Buyers in New Zealand, British South Africa and Canada have also extended their purchases of this branch of British manufacture. Supplies to British India, the Straits Settlements and Ceylon however, show a considerable reduction. Regarding the shipments to foreign markets, it is satisfactary to notice that whereas only 977 cwts. of printings were taken by the United States in July last year, consignments of 3,085 cwts. were despatched to that country last month.

E. & N.-E. London Master Printers

Outing to St. Albans and Croxley Mills.

[By a Member of the Association].

We English are supposed to take our pleasures seriously, but perhaps printers are an exception. A looker on watching the East and North-East London Master Printers gathering together at Stratford Town Hall on Thursday last for their visit to St. Albans and Croxley Mill would certainly have observed nothing serious in our demeanour. Perhaps it was because we were able to thrust into the background all thoughts of "picas" and "leads," "lay-edges" and "trims," and look forward to watching other folk work. Or was it because we had the ladies with us? Whatever the reason, we were quite a merry little crowd. Our old president, Mr. E. R. Alexander, who resigned only last year, was with us, and it was evident that he also had made up his mind to enjoy himself.

We had a lovely ride through the country, and what with the sunshine and the scenery, there was little left to be desired.

As we were not due at Croxley until 2.30 p.m. we first of all visited St. Albans, where we whiled away the time inspecting the sights. Mr. Richardson, a local master printer and a secretary of the Hertfordshire Association was most kind (and successful) in his efforts to give us a good time at St. Albans, and the members of our party were each presented by the Association with a guide to the town. Those who have not visited this place should certainly make it one of their first trips. It is particularly interesting and historical, and dates back to Roman times. The local inhabitants are justly proud of the fact their town was the scene of the first English martyrdom—that of St. Alban. The cathedral here is probably unique. It contains architecture of three distinct periods. All this and its many other interesting features were most lucidly and pleasantly explained by Mr. Richardson and the verger of the cathedral.

A little later we repaired to Messrs. Buglers where a most excellent lunch served to preserve our good spirits. Lunch over, we made our way to the waiting charabancs (at least most of us did) ready to take us to Croxley. One section of our party had been tempted into a neighbouring hostelry, and had the "wind-up" terribly when they came out and found no trace of the charabancs. It was, however, only a false alarm as the charabancs were round the corner.

We got to Croxley almost on time, and were met by the mill managers. It is pleasant to think that there are folk like Mr. Skeins and Mr. Webb who will put themselves out to the extent they did in order to entertain poor printers like ourselves. Guides had been appointed and everything nicely arranged, and so we started on our voyage of discovery round the mill. To those whose knowledge of paper has been limited to its association with their printing machines the manufacture of paper is a real eye-opener. It was instructive to see the raw material go through many processes before it became paper, it being sorted, dusted, boiled, washed and broken, then bleached and beaten to the required length of fibre, and if necessary dyed. Next the finished pulp was pumped up to the papermaking machine. At one end we saw the fibres floating in water, and gradually the sheet of paper formed shape, becoming drier as it progressed, until at the other end it was really paper. The whole factory is a model of papermaking organisation, and it was quite a treat to see everything working so smoothly and harmoniously.

By the time we had finished touring the mill we were ready for the tea which Messrs. J. Dickinson and Co. had very kindly provided for us, but we were certainly not ready for the after-tea downpour which greeted us and accompanied our journey home. Despite this, however, our good spirits of the morning were in no way damped (certainly not any of the after-dinner spirits), and we eventually arrived home pleasantly tired and not too "wet." It is to be hoped that this is not the last of these interesting trips, and many thanks are due to our indefatigable secretary, Mr. T. D. Hawkins, for arranging the outing. One cannot refrain too from again putting in a word of appreciation to Messrs. J. Dickinson and Co. for their kindness in allowing us to visit the mill.

Personal.

Sir William E. Berry, Bt., has consented to preside at the ninety sixth anniversary festival of the Printers' Pension Corporation at the Connaught Rooms on Tuesday, November 13th. The proceeds of the festival are to be devoted exclusively to the Printers' War Orphan Fund, from which has been distributed over £40,000 in weekly grants to the children of printers killed in the war, the Fund at the present moment having an overdraft of £14,000.

Lord Riddell will open the 68th annual international exhibition of the Royal Photographic Society of Great Britain at 35, Russell-square, W.C., at 3 p.m., on September 15th.

Sir Thomas Beecham, Bart., enters the ranks of newspaper proprietors by purchasing the *Era*, the leading organ of the theatrical profession.

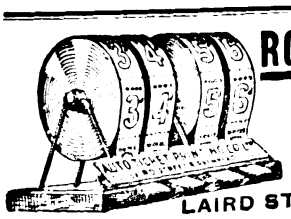
Mr. T. W. McAra, J.P., secretary of the Newspaper Proprietors' Association, and Mrs. McAra have returned from a very enjoyable holiday in Switzerland, deriving great benefit from the change.

Mr. Douglas Cockerell is to give a series of nine bookbinding demonstrations for students of the School of Librarianship, University College. The demonstrations are to be given on Tuesdays at 3 p.m. from January 29th to March 25th inclusive.

Mr. Frank A. Munsey, the American publisher and newspaper proprietor, was among the passengers sailing on the s.s. "Leviathan" from Southampton on Tuesday.

Mr. T. G. Tallantire, the proprietor of the *Zulu Times*, is sailing for South Africa on the "Balmoral Castle" after several months' spent in this country renewing friendships of 21 years ago.

Miss C. M. Ratcliffe, of the staff of the *Derby Daily Express*, has been presented by her colleagues with a silver tea service and other gifts on leaving on her marriage to Mr. F. Taylor-Henderson, of the staff of the Press Association.



Mr. J. T. Rose, who has been the assistant editor of the *Sunday School Chronicle* for 30 years, has completed 40 years' service in the National Sunday School Union Publicity Department.

Mr. T. G. Newland, general secretary of the N.U.P.B.M.R. and Paper Workers, was scheduled as tug-of-war umpire on the occasion of the sports gathering of his Association on Saturday at Herne Hill. As a matter of fact, he appeared to have "no fixed abode," but readily placed his valuable assistance in different parts of the enclosure wherever it was required.

Mr. E. W. Spackman, who is now at home in the position of general secretary of the printing section of the Union, had charge of the members' children's races. As can be imagined it was not an easy task to manage an entry of this kind, with the youthful competitors' ages ranging from as young as five to 14 years. Mr. Spackman, however, was equal to the occasion and tactfully succeeded in carrying through his duties with gratification to both winners and losers alike.

Mr. A. E. Holmes, the secretary of the Printing and Kindred Trades Federation, also rendered valuable aid on the field.

Holidays were responsible for the absence of several leading figures in the ranks of the Union. Among these were Mr. W. Ross, who was at Plymouth, and Mr. S. Stubbings, who was recruiting at Bournemouth.

NEW COMPANIES.

FAIRBROTHERS, LTD. — Capital £1,100, in 2,000 preference shares of 10s., and 2,000 deferred shares of 1s.; reporting, advertising, press and commission agents, general merchants, newspaper proprietors and printers, news distributors, etc. Private company. Subscribers: Mary T. Edge and H. Marshall. Directors by subscribers. Registered office: 21, Panton-street, S.W.1.

DELCOY IMPORT CO., LTD.—Capital £500, in £1 shares; fancy goods dealers, booksellers, stationers, dealers in prints, pictures, and drawings, advertising agents, etc. Private company. First directors: B. Colp and H. Colp. Registered office: 17, Bedford-row, W.C.

CLAYTON AND JAMES, LTD.—Capital £2,000, in £1 shares; to adopt an agreement with F. H. Lightwood, trading as Clayton and James, of 31-3, High Holborn, W.C., and to carry on the business of manufacturers and factors of, agents for, and dealers in mechanical and electrical machinery, agents for printing, advertising and general publicity, etc. Private company. First directors: F. Alton-Nagel, J. E. Burt, C. F. Dickson and F. H. Lightwood. Registered office: 31-33, High Holborn, W.C.

J. S. DAVEY AND SONS (1923), LTD.—Capital £5,000, in £1 shares; to acquire the business carried on at Mount Pleasant, E.C., as J. S. Davey and Sons, Ltd. (in liquidation), and to carry on the business of manufacturers of, and dealers in jewellery and other cases, boxes, stationers' sundries, photographic materials, etc. Private company. First directors: G. V. Wellesley and W. C. Amcotts. Registered office: 63-71, Mount Pleasant, E.C.

GLADSTONE TAYLOR AND CO., LTD.—Capital £1,500, in £1 shares; to take over the business carried on at 34, Strand, W.C., as Gladstone, Taylor and Co., and to adopt an agreement between C. R. Chater, F. Bates, W. L. Irvin and C. E. H. Davis, and to carry on the business of advertising agents and contractors, etc. Private company. Subscribers: C. R. Chater and C. F. Bates. First directors: C. R. Chater, C. F. Bates and C. E. H. Davis.

HORTON AND ARLIDGE, LTD. — Capital £20,000, in £1 shares; to carry on the business of a box manufacturer, papermaker and stationer carried on by W. H. Horton at Campbell-square, Northampton, as Horton and Arlidge. Private company. Directors: W. H. Horton and J. T. Chamberlain.

J. HALDENBY AND CO., LTD.—Capital £1,000, in £1 shares; manufacturers of, and dealers in, plant, machinery and general equipment, materials and sundries for engineering works, chemical works, etc Private company. First directors: J. Haldenby and J. B. Lowthian. Registered office: 53, Ankle-hill, Melton Mowbray.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

WALLASEY PRINTERS, LTD. — Issue on August 11th, 1923, of £100 second mortgage debentures part of a series already registered.

WORLD'S FAIR, LTD. (newspaper proprietors, etc.).—Mortgage on underlease relating to land in Union-street, Oldham, with buildings thereon known as the *Chronicle* offices, with plant, etc., dated July 28th, 1923, to secure all moneys due or to become due from the company to the National Provincial and Union Bank of England.

WILLIAM SINCLAIR AND SONS (STATIONERS), LTD. (Otley).—Debenture dated August 10th, 1923, to secure £15,000, charged on the company's undertaking and property, present and future, including uncalled capital (if any). Holders: Bank of Liverpool and Martins, Ltd.

BANKRUPTCIES, etc.

Re JOHN W. B. SEXTON, 7, 9, 11 and 15 Lavington-street, Southwark.—The creditors under this failure met last week at the London Bankruptcy Court. The official receiver reported that it appeared from the debtor's statements that he came to England in 1914, and took over the management of the Healy Box Co., Ltd., in which he acquired a considerable number of shares. He acted as managing director of a successful business, and in November, 1920, it was taken over by the Paper Tube and Box Co., Ltd., the debtor receiving in substitution for his shares in the old company £3,200 7 per cent. cumulative preference and 85,000 1s. ordinary shares. He roughly estimated his liabilities at £2,000, against assets of uncertain realisable value, consisting chiefly of equity in debentures and shares. The failure was attributed by the debtor to guarantees given and money advanced for the Paper Tube and Box Co., Ltd. Mr. F. W. Stephens, I.A., was elected trustee to wind up the estate in bankruptcy.

Warrillows' Scheme Approved.

There duly took place on Thursday of last week the meetings of the unsecured creditors, of the preference shareholders and of the ordinary shareholders of Warrillows, Ltd., for the purpose of considering a scheme for the re-organisation of the company's capital. After an explanation of the position and a short discussion, the resolution was passed almost unanimously. It was made clear that the position as shown in the balance sheet drawn up was arrived at on the basis of the business being a going concern, and if liquidation of assets had to take place there would in all probability be no return to the shareholders. Recognising this, and the fact that shareholders were not asked to provide any further cash, the passing of the scheme was facilitated. The bank is providing a further £60,000 on security which will give the company £40,000 of working capital, and it is hoped this will enable the undertaking to retrieve its fortunes.

Preference shares are to be reduced to 10s. and the ordinary shares to 1s. The preference shareholders, while giving up their participating and cumulative rights, are to have their interest raised from 7½ to 10 per cent., though no dividends are to be declared while any of the first mortgage debenture stock or the income debenture stock remains undischarged. The 440,000 shares held in Thomas De La Rue are taken into the balance sheet at 5s. per share. These shares were originally purchased from members of the De La Rue family for £382,790, the purchase being made out of the proceeds of a sale of 10,000 shares of J. and A. Weir.

Amalgamated Press (1922), Ltd.

Another Successful Year.

At the ordinary general meeting of the Amalgamated Press (1922), Ltd., in London, on Monday, Sir George A. Sutton, Bart. (the chairman) presented an encouraging review of the year's operations, which included the establishment of 14 new periodicals.

Printing Equipment.

With regard to production, the chairman said, the cost of printing remains high. The greatly increased wages, reduction in working hours, heavy taxation, and enhanced cost of materials constitute a problem in these difficult days. The extensive Sumner-street Printing Works are completed, and the printing is now concentrated in three large factories, Sumner-street and Lavington street, S.E., and Gravesend, Kent. Five smaller factories have been closed down, and in the case of certain freeholds will be disposed of to advantage. It is expected that the very considerable expenditure on additional printing works and plant will be fully justified by results, and the concentration will contribute in no small degree to greater efficiency and economy in working.

The year's revenue from advertisements far exceeded all previous records, nearly 9,000 full pages in the company's journals being purchased and paid for by advertisers.

A Self-Contained Company.

Sir George went on to point out that this is the only periodical and magazine publishing company in the world that owns its own printing plant, makes its own ink and its own paper, and owns its own forests for the making of pulp. "There are, of course," he added, "newspapers in this country in the same fortunate position. I refer to the Associated Newspapers (which owns the *Daily Mail*) and also to the *Daily Mirror* and *Sunday Pictorial*, the newspapers controlled by Lord Rothermere, who, with his brother, the late Lord Northcliffe, was the first newspaper proprietor in this country to realise the necessity of papers owning their raw material."

Imperial Paper Mills.

The Amalgamated Press has the controlling interest in the Imperial Paper Mills, Ltd., the second largest paper mills in this country, and the recent additions to its plant have made it probably the most up to-date paper-making concern. The Imperial Paper Mills, in its turn, has the largest interest in the Gulf Pulp and Paper Co, situated at Clarke City, in the Province of Quebec.

A large proportion of the mechanical pulp used in the production of the company's periodicals is drawn from this source, and it is essential, said the chairman, that the directors should maintain a very careful financial policy in view of the fact that it may be necessary at an early date to provide for the purchase of further timber limits, to ensure an ample supply of the raw material required.

The directors' report and statement of accounts were adopted, and a final dividend for the year of 2s. a share (less income-tax) was declared on the ordinary shares.

Davies and Royle, Ltd.

Owing to the recent lamentable losses by death which this firm have suffered rearrangements at their Manchester and Leeds branches are being made. Mr. Cuss, who was formerly branch manager of the Leeds office, has been appointed branch manager of the firm's Manchester office. He will commence his duties in Manchester on Monday, September 3rd.

Mr. Hance has been appointed manager of the Leeds office. Mr. Hance commenced his

Digitized by Google

new duties on Monday last, the 20th inst., and will be introduced by Mr. Cuss to the firm's clients in Yorkshire and the Northern area.

Both these gentlemen spent a considerable time at the head office in London of Messrs. Davies and Royle, Ltd., and are thoroughly conversant with all grades of papers manufactured by the many mills for whom this firm are British agents. In addition they both possess a thorough knowledge of the business procedure at the head office.

It is the intention of Mr. John Mutimer, managing director, to introduce Mr. Cuss to the firm's many friends in the area Mr. Cuss will travel, and later Mr. Mutimer will renew the firm's many friendships in the whole of the Northern area. This will entail several weeks travel in the North and Midlands.

Edward Lloyd, Ltd.

Foundation Stone of the New Kemsley Mill.

An interesting ceremony took place on Friday, August 27th, when Mr. Frank Lloyd laid the foundation stone of Messrs. Lloyds' new mill at Kemsley. The wording on the stone is as follows:—

THIS FOUNDATION STONE WAS LAID BY FRANK LLOYD, ESQ., IN COMMEMORATION OF HIS 50 YEARS WITH EDWARD LLOYD, LIMITED.
17TH AUGUST, 1923.

A silver trowel with an ivory handle was presented to Mr. Lloyd by Mr. W. L. Grant, architect, and Mr. Bishop, builder, who were in attendance whilst the stone was lowered into position.

Having declared the stone well and truly laid, Mr. Lloyd turned to the large gathering of members of the firm who had come from the Sittingbourne Mills, and he expressed to them his thanks for the honour which they had done him in asking him to lay the stone.

In support of Mr. Lloyd there were present on the platform Messrs. P. G. Denson, managing director of the firm, A. J. Evans, A. A. Richards, chief engineer, C. Martin, papermaker, E. E. Fuller, chief electrician and H. R. Raynham, transport manager.

The important developments of Messrs. Edward Lloyd, Ltd., Sittingbourne, in connection with their new mill at Kemsley, embrace the building of a model village. A rough sketch showing the roadways, square, and the first 150 houses proposed to be erected for the employees in the first unit of the Kemsley Mills has been submitted to the Milton Regis Urban District Council.

At a recent meeting of the latter body, the question of extending the gas main to the new Kemsley village was considered, and the subject of conveying the sewage to the Council's works was also discussed. It was subsequently agreed that the surveyor be instructed to get out estimates at once of the cost of the whole scheme with a view to a loan being applied for. The gas manager was also instructed to prepare an estimate of the cost in regard to the gas supply for the new village.

We understand that at present the arrangement is to build 150 houses, the number to be increased to house the extra men employed in further extensions of the Kemsley Mills. It is stated that the plans cover 500 houses which the firm propose to erect at Kemsley.

Wages Negotiations.

The question of the new wages agreement in the British paper industry has been considered by the three district committees of the Papermakers' Association, and the Negotiating Committee are meeting the unions this week.

It may be recalled that when negotiations took place at the end of July in Manchester, between the Negotiating Committee of the Employers' Federation of Papermakers and the delegates of the National Union of Printing and Paper Workers and the Amalgamated Society of Papermakers the proposals of the employers were discussed, and it was decided that the reply of the unions should be reported to the members of the Employers' Federation for their decision as to future action.

THE best day of the year is—to-day.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

SWEDEN.

A commission agent in Gothenburg desires to secure the representation for Sweden of British manufacturers of printing inks, type metal, etc. (Reference No. 201.)

NETHERLANDS.

An agent in Amsterdam desires to secure the representation for the Netherlands of British manufacturers of bookbinders' calico, leather cloth, artificial leather, etc. (Reference No. 225).

Finland's Leading Industries.

The first paper mills were founded in Finland in the beginning of the 17th century. In an interesting article by Mr. Marth Kovero (Chief Director of the Central Statistical Office, Finland), in the "Bank of Finland Monthly Bulletin," dealing with the growth and development of Finnish industries, it is stated that the paper industry occupies the second place if the number of industrial works, the gross value of production, and the number of hands are kept in view, but the first place, if the value of the production, or the motive power used is taken into consideration. But especially with regard to economy the paper industry must be placed first, as the raw material in this industry is brought to a much higher degree of refinement than in the other branches of wood-refining.

Referring to the various industrial establishments belonging to the wood pulp and papermaking group of trades it is stated that in 1921 there were 50 wood pulp and cardboard works (the gross value of their production being 214·8 million marks), 23 cellulose mills (gross value of production 429·0 million marks) and 30 paper mills (gross value of production 556·8 million marks). The rest were factories for paper and cardboard articles, such as wall-paper, envelopes, paper bags, boxes, etc.

The most important products of Finland's paper industry are news-print, printing paper and cardboard and brown wrapping paper. Finland is the foremost of the northern countries in the cardboard branch. An excellent cardboard (the so called "Enso cardboard"), which has been advantageously used in the construction of dwelling houses, is manufactured in Finland. Finer kinds of paper made of other raw materials than wood are also manufactured in Finland.

The timber and paper industries together form quite a group of their own in Finland's industry. There are many reasons for this. These branches of manufacture are already on account of their extent much ahead of the rest, as, in 1921, they accounted for 40 per cent. of the gross value of production, 41 per cent. of the refinement value, 42 per cent. of the number of hands and 64 per cent. of the motive power employed. They have a special importance for the public economy of Finland on account of the fact that the exports of Finland depend almost entirely on these industries. For instance, in 1922, 84 per cent. of the exports were products of the timber and paper industries. They also occupy an exceptional position owing to the fact that they almost entirely use local raw materials.

CONSIDERABLE interest is being shown by pedestrians in Kingsway, in a clever working model of a well-dressed woman that shows the capabilities of the Dennison crepe paper products.

Italian Import Duties.

Modifications in the General Tariff.

Schedule "A" annexed to the Italian Decree-Law of July 11th indicates the amendments made in the General Tariff as established by the Royal Decree of June 9th, 1921. The amendments affect both the Tariff nomenclature (in the case of certain Tariff headings) and also the rates of duty. For the most part the duty alterations are in the nature of reductions of the previous "General" rates, such reductions being generally effected by reducing the Tariff "co-efficients."

Under the heading of paper, cardboard and products of the graphic arts, paper, white or coloured in the pulp, not sized, in rolls, and destined for newspapers, bears an import duty of 2 gold lire (per 100 kgs.). Similar paper destined for other periodical publications is subject to an import duty of 10 gold lire, and the co-efficient of increase is 0·2.

The characteristics of the paper and proof of the intended use of the same for newspapers and other periodical publications and of actual use for this purpose must be laid down and ascertained in accordance with the regulations fixed by Ministry of Finance.

Printed books, in other languages (than Italian), loose or simply stitched or Bodonian style, or with covers of pasteboard, covered or not internally with paper or with cloth and with title printed outside the cover, are admitted free.

The following goods in category XXII., machines and apparatus, carry the duties (in gold lire per 100 kgs.) mentioned, the co-efficient of increase in each case being 0·8:—

Machines, not specified, for additional working of paper or cardboard, 18; machines for binding or re-binding books and registers, 20; machines for the graphic industries, except those for casting type and composing, weighing: More than 5,000 kgs., 18; more than 2,000 and up to 5,000 kgs., 20; more than 1,000 and up to 2,000 kgs., 24; more than 500 and up to 1,000 kgs., 28; up to 500 kgs., 32.

Corrugated Fibreboard.

Its Value as a Packing Material.

The more general use of corrugated fibreboard as packing material would, writes a correspondent in *The Times* Trade Supplement), result in fewer claims for damage and pilferage and fewer breakages of fragile articles. Though this resilient, light, and economical material is being used to some extent throughout the British Empire, there is still an extensive field which has not been entered. In the Dominions particularly a great deal of interest is now being taken in the corrugated board container.

What is wanted is a closer familiarity with the varied uses of corrugated fibreboard. In the United States an early recognition of this valuable material caused the inauguration of an active trade association, which has given much practical information to all likely users. A research laboratory has even been established with the object of overcoming all kinds of packing problems.

Corrugated fibreboard can be obtained in three types: unlined, single-lined and double-lined. The first is merely a single sheet of thin fibreboard which is corrugated, and is used for lining, covering and padding inside packing cases or other forms of paper containers. In the second the corrugated sheet is glued to a flat sheet so that the corrugations are held firmly and prevented from stretching or flattening out except under great pressure; and the double-lined board has a flat sheet glued to either side of the corrugations. Whereas the single-lined board is about $\frac{5}{16}$ths of an inch in thickness, and is used principally for interior packing, the double-lined board has a tensile strength greater than that of any other form of cardboard of equal weight, and it is extremely rigid. As it may be bent to a right angle without loss of tensile strength, it is used chiefly for the manufacture of packing cases.

Perhaps the most convenient form of packing case made from one sheet of the double-lined board is what is known as the slotted type.

Another form of corrugated board container is known as the half-slotted type. It provides for a separate cover for one end instead of having both ends slotted.

Sometimes the ordinary type of corrugated fibreboard container is not strong enough and does not provide sufficient resistance to make it safe for fragile goods. In such a case the double-wall variety makes the ideal container.

Canadian News-print.

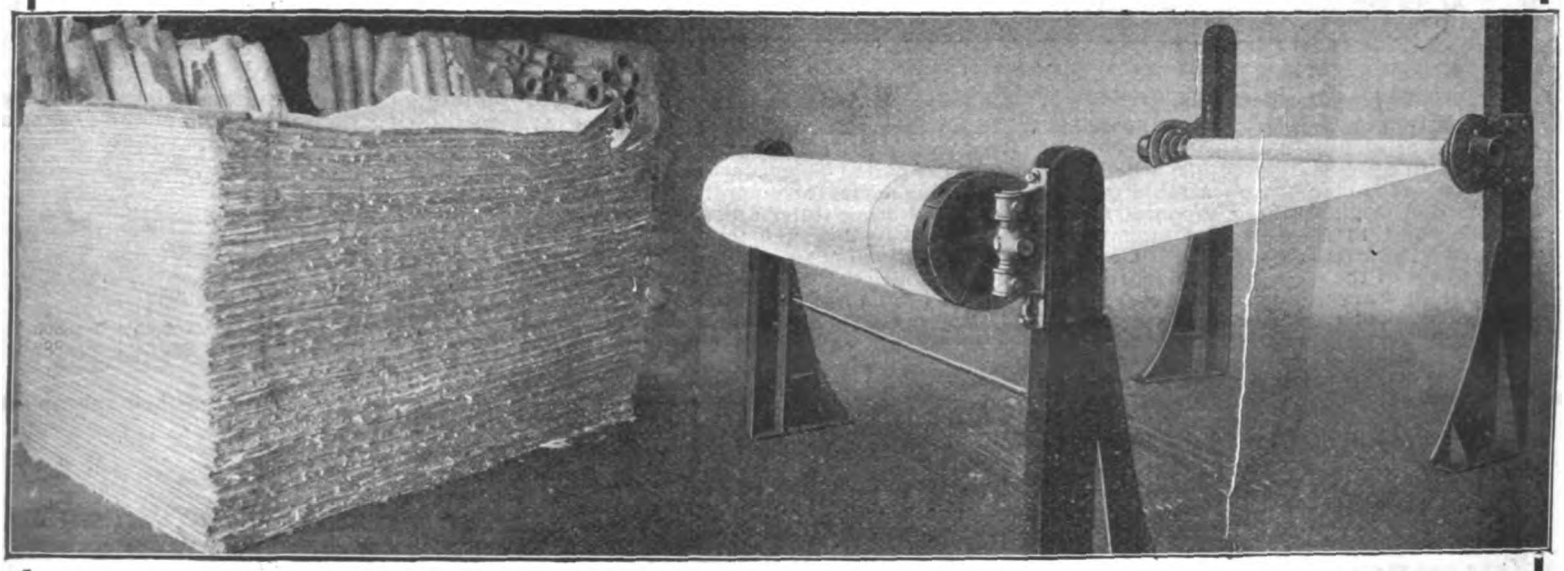
The Canadian Pulp and Paper Association has issued the following report on the production and export of news print paper:—

The production of news-print in Canada during the first six months of 1923 has reached a total hitherto unapproached for any similar period. Up to the end of June, Canadian mills manufactured 619,802 tons of news-print paper, which represents a daily average production of 3,973 tons or about 470 tons more than the daily average throughout 1922. This tremendous increase is due largely to the addition of new machines to the productive capacity of the mills but also reflects an increased efficiency of operation and the speeding up of existing machines.

A comparison of the production figures for the first half of this year with those for the corresponding periods of previous years shows that production was 20 per cent. greater than in 1922, 66 per cent. greater than in 1921 and 39 per cent. greater than in 1920. The production figures for the first six months of the years 1920–23 are as follows:—1923, 619,802 tons; 1922, 516,506 tons; 1921, 373,988 tons; 1920, 443,512 tons.

Other new machines are scheduled to come into operation before the end of the year and with the recently installed machines getting into full production it is expected that the production for the second half of this year will surpass that for the first six months by a considerable amount. On this basis, it is probable that the Canadian mills in 1923 will produce well over 1,250,000 tons of news-print. When it is recalled that the total production in 1913 was only 350,000 tons, the magnitude of the development in this branch of industry during the past ten years will be appreciated.

The consumption of news-print in Canada is from 120,000 to 130,000 tons annually and approximately 90 per cent. of our production is exported. Of the 619,802 tons produced in the first half of the year, 550,765 tons were exported, 536,187 tons going to the United States and the remainder chiefly to Australia, New Zealand and South Africa. Exports in the corresponding six months of 1922 and 1921 were 457,340 tons and 319,925 tons respectively, so that this year's exports show a gain of 20 per cent. over those for 1922 and of 72 per cent. over those for 1921.



The total exports for the first six months of 1921 were 319,925 tons; 1922, 457,340 tons; 1923, 550,765 tons. The distribution during January-June last was:—U.S.A., 536,187; Australia, 5,163; New Zealand, 6,095; South America, 323; South Africa, 2,427; all other, 570.

The exports to overseas countries have been considerably below the level of the past few years; there is a big increase in the shipments to the United States. Consumption in that country during the last twelve months has broken all records, amounting in 1922 to nearly 2,500,000 tons of which 1,029,000 tons were imported, 87 per cent. of the imports coming from Canada and the remainder from European countries. This big demand from the United States market is reflected in the exports to that country which this year have shown an increase of 27 per cent. over those for last year and of 83 per cent. over 1921.

LOVE'S PAPER RECOVERY MACHINE.

Patented (No. 144485) by Joseph Love.

THIS Machine has been invented for the purpose of speedily recovering the small quantities of paper left on centres or spools which are thrown out from Printing Machines, etc. (commonly known as "Reel Ends"), so that it may be cut into suitable sizes by the Guillotine.

CHIEF ADVANTAGES:

1.—No spindles, bars, or cones are required, the reels being kept in position by a patent spring device thus saving time and labour in loading and unloading.

2.—It occupies a space of only six feet on the run, and is quite noiseless.

3.—The power required is such a small amount that it can be driven from any existing shafting.

4.—Centres of any kind or width can be worked on the machine.

5.—It can be run at the high speed of 500 feet per minute, and will recover approximately 3 tons of paper per day.

6.—It can be constructed to suit all requirements in the off-cut trade, and is equally valuable to Printers or in Paper Mills.

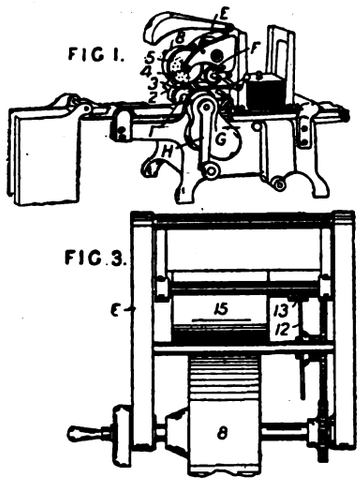
New Inventions

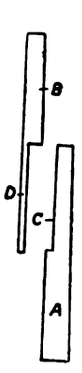
Engraving Machines.



This invention relates to pantographic engraving or etching machines of the type described in Specification 153,186 wherein a work plate 49 is clamped on a table 35 slidably carried in guides by a support 42, and a work point 19 is carried by an arm 18 mounted on a carriage 15 universally movable in the plane of the work by the operation of a pendulum transmitting arm 26 carrying a stylus 33 adapted to be moved over a pattern supported on a base 11. A member is provided adapted to engage the stylus and hold it, the pendulum arm 26, and the carriage 15 immovable, means being also provided to move the latter longitudinally step-by-step. The work point 19 may thus be held stationary while the table 35 is moved laterally so as to inscribe a horizontal line on the plate 49 and subsequently moved into positions for inscribing spaced lines parallel to the first. As shown,

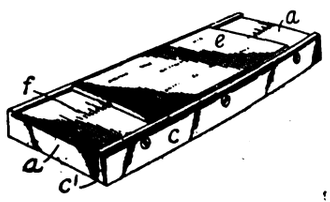
the support 42, Fig. 3, is also longitudinally slidable in guides 44 so that vertical lines may be inscribed by traversing the support 42 by means of a rack and pinion, the spacing being provided by an intermittent adjustment of the work table 35 by means of a similar rack and pinion. The device for rigidly fixing the stylus comprises a removable plate 53 adjustably fixed to the pattern table by means of a clamping plate 59 engaging behind a slot in the table and a clamping screw 61. Pins 60 projecting from the plate 59 engage holes in the member 53 to prevent angular movement thereof. A block 50 slidable on the plate 53 and operated by means of a rotatable screw 52 is provided with an aperture 51 in which the stylus 33 is held by means of a spring 62, or with a socket for a ball ended sleeve 64, Fig. 5, within which the stylus 33 is secured by a screw 65. The screw 52 is rotated by its knurled end 58 by an amount regulated by a star-wheel 55 and spring pawl 57. The patentee is Mr. W. S. Eaton.

Inking Apparatus.



In an invention patented by Messrs. L. M. Barman and Roneo, Ltd., the inking apparatus of the parent Specification is modified by employing means for reciprocating the middle ink-distributing roller axially by means of a rotating skew-disk, and the first distributing roller is driven positively by gearing instead of being driven frictionally from the segmental inking roller between which and a similar pressing roller the stencil card and letter are passed to effect the printing. The

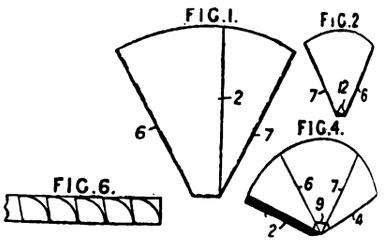
segmental inking roller 2, Fig. 1, is on a shaft 1 driven by an operating handle H, and the first inking roller 8 is driven by gearing 3, 4, 5 from the shaft 1. The roller 8 and a roller 15 in contact with the same are mounted in arms on brackets E, and a third roller F supplies ink to these from a container G. The roller 15 is reciprocated axially by a skew disk 12, Fig. 3, driven by gearing from the shaft of roller 8 and engaging a grooved collar 13 on the axle of the roller 15.



Side and Foot Sticks.

Extendable side and foot sticks form the subject of a patent by Messrs. C. C. Whitling and W. A. Gitsham. They are formed of two relatively sliding members A, B, one A of which is formed in one side with a vertical recess C in which slides a tongue D on the member B. The parts are maintained at the desired extension by the insertion of packing, such as quads, quotations, etc., between the ends of the tongue D and recess C. A scale on the member A indicates the amount of packing required.

Printing Blocks.



Mr. W. S. Eaton has patented a printing block which comprises a thick base *a* and a thin engraved or etched plate *e*, bearing the design in intaglio and clamped to the base by a bar *c* adapted to rock about a rib *c*¹ at its lower edge bearing against the lower edge of the base. Graduations *f* are preferably provided on the base *a* to facilitate positioning the plate *e*. The block permits the use of thin printing plates *e* of uniform thickness thereby facilitating the production of the plates in

the engraving machine and their subsequent storage.

Paper Cups.

According to an invention in the name of Mr. F. H. Rogers, a blank for making conical paper cups in the flat or folded form is formed as a sector of a circle with an additional flap 2, Fig. 4, which is coated with adhesive. The blank is then folded on the line 7, which may be creased or scored, to bring the edge 4 to the centre of the blank, and then on the corresponding line 6 so that the flap 2 overlies the edge

4 and adheres thereto. The point of the triangle thus formed is bent backward upon the line 9, so that the small triangular flap 12, the inner face of which is coated with adhesive, is pressed upon the back of the blank, as shown in Fig. 2. Fig. 1 shows the front-face of the completed cup. Fig. 6 shows the manner in which the blanks are cut from paper strip.

Bamboo Paper.

Indo-China was the first French colony to adopt bamboo in the manufacture of pulp and paper. Works were built at Vietri in 1912, and it is reported that the annual production of bamboo pulp is 3,000 metric tons. Half the production is utilised at a mill at Dap-Cau, and among the journals using the bamboo paper manufactured are several in Tonkin.

CARDBOARD STATUARY.—An imposing piece of cardboard statuary closely resembling white marble was hoisted on Thursday last week by workmen to the lofty pedestal beneath the arch of Bush House at the bottom of Kingsway. The architects of the building are at present undecided as to what kind of permanent statuary, if any, should be placed over the inscription: "To the Friendship of the English speaking Peoples."

Disinterested Advice.

In "Notes for Buyers," the house organ of Messrs Spicers, Limited, "Ubique" writes: "By the way do you take in the weekly journal of the craft, the 'BRITISH AND COLONIAL PRINTER AND STATIONER'? I haven't a farthing of money interest in it, but fair's fair; and when I see this country producing a weekly printing trade paper which the craft in other great countries cannot produce, and when I see such plenty of good craft matter in it, I feel constrained to put in a word about it. You are surely not doing yourself justice unless you take it and regularly glance over it."

SUBSCRIPTION FORM.

Please send me weekly "The British and Colonial Printer and Stationer," at 13s. per annum (including postage) until countermanded.

German Paper Competition.

The Serious Effect on British Products.

German competition in paper continues to arouse anxiety among British manufacturers, and official statistics would seem to justify the alarm which is felt. The extent to which importation of German paper is growing is described by a correspondent of *The Times* (Trade Supplement) as far more serious than any misuse of Germany's printing presses or postal services.

The value of paper imported into England from Germany during the six months ended June 30th last year almost equals the total for the whole of the previous year. While English exports are slightly declining, the volume of paper imported from Germany continues to grow. The writer has been delving into the official statistics, and, taking the monthly value of German paper imports alone, from August last the figures run progressively, in thousands of pounds sterling, 43, 47, 53, 63, 66, 82, 91, 107, 142, 132, 162, the last-named figure representing June imports. As a comparison, the average monthly import of German paper in 1913 was in the region of £115,000.

In regard to German competition against our home manufactures, the position is serious enough, but unfortunately it does not end there. Take the wrapping section of the trade. Here there is normally a good regular business with Norway, Sweden and Canada. Under existing conditions Canada finds it impossible to secure any business. Our own mills are reduced to short time, and in some cases contemplate a complete shut down. Scandinavia must have an outlet for a certain proportion of her wrapping paper production, but runs the distinct risk of being entirely kept out of the customary markets owing to low German offers. The alternative is to face losing price and retain a part of the trade. Thus is inaugurated a system of undercutting against which our own mills find themselves helpless.

Position of News-Print.

The condition of affairs in Germany is influencing the course of trade in other directions. Wood pulp is offered at prices with which the Scandinavian mills cannot compete. News print is quoted at figures below our own costs of production, and well below even the Finnish quotations. Fortunately for us and other countries, German production has its limits. Orders placed with German mills are delivered according to the mill's desire and ability to execute. In some cases part payment with order is a condition of the contract. Much of the paper now made by the German mills comes in below standard, and there is no redress. These factors counteract the low price to a great extent, but the fact remains that German paper is coming into this country in increasing quantities. How the situation is to be remedied it is difficult to say.

Apart from the wrapping section, the coated paper and the common printing sections are finding it difficult to hold their own in competition with imported papers. Large orders for cheap super-calendered printings have recently been placed with foreign mills. In all this, of course, the trader stands to gain at the expense of the British paper mill, but foreign workers are kept busy, while an unduly large proportion of paper-mill employees at home are out of employment.

It is satisfactory to note that the English news-print mills are keeping busy, notwithstanding increased imports from Finland and Newfoundland. The Australian preference is here standing our mills in good stead. Although the demand has slightly diminished, the export of news-print to Australia is a main feature of this branch of trade. In New Zealand, where tariff conditions are equally favourable to Canada, we do not figure so prominently in the returns, but still the market is valuable for our news-print producers. The home consumption of news-print keeps very steady, and holds good prospects for the news-print mills. If there is an unsatisfactory feature, it is the price, which leaves a very bare margin of profit. Compared with chemical wood pulp, which has recently eased considerably in price, the price of mechanical is unduly high.

Klippans Paper Mill, Sweden.

Established 350 Years.

Sweden ranks among the oldest paper-making countries in Europe, as its introduction dates back to the beginning of the 15th century. The Klippans Paper Mill, situated in Scania (which formerly belonged to Denmark), celebrated its 350th anniversary on August 11th last, the year 1573 thus marking the first paper mill in Denmark.

The Klippans Paper Mill was founded by Sten Bille, and records in the form of a water-mark with S. B. introduced, and also a book of poems containing a reference to the mill, stamp the authenticity of the period. Little is known of the mill during its first 60 years. In 1637 a German merchant named Mattias Smidt was officially granted the privilege of making paper at Klippans, and his paper mill was completed in 1639.

Due to economic troubles, the mill evidently had a chequered career, as we find in 1653 Klippans Mill was taken over by the Crown, and subsequently it was occupied by Samuel Dröscher, also a German. A water-mark in use at that period was H.V.C. underneath a crown, having reference to a local monastery.

It was in 1658 that Scania, on peace being declared, passed to Sweden. Samuel Dröscher and Son had the mill until 1715, and things apparently prospered. The annual production was 2,000 reams, chiefly used for official purposes. In fact, the whole demand for paper in Scania was satisfied by the Klippans Mill. The quality was described as greatly improved, and the product of good appearance.

Although the mill ceased to be the property of the Crown in 1730, it was subject to certain dues for the upkeep of the military. The owner at that time was Hans Dröscher, who held occupation up to 1749, when the mill was acquired by Nils Malmgren. On his death it was managed by the widow, Helena Christina Samsjö.

Following a period of depression the mill was sold by auction in 1772, the new owner being Lieut.-Col. Abraham Tornérhjelm. Developments followed, agricultural estates and other industrial works being linked up. The paper mill was rebuilt, the building comprising two floors. The death took place of Tornérhjelm in 1776, his widow carrying on the business until 1790, when it was sold to Baron von Holstein. The annual production had grown to 2,500 reams, mostly printing paper with a small quantity of writing paper.

In 1798 the mill came into the hands of Carl Fredrik Kemner, who made certain improvements, changing production from printings to writings, with the result that output figured at 17,000 reams per annum. Lack of capital, however, led to the transfer of the mill to a limited company, with Kemner as manager. As the latter held the majority of the shares, an arrangement was made for the other shareholders to receive a fixed payment of 12½ per cent. per annum. In 1911 and the few following years, prosperous times were experienced, and attention was given to fine papers of a superior grade. Klippans paper mill achieved quite a reputation, being considered one of the foremost establishments in Sweden. The Napoleonic wars then caused great unsettlement; in 1814 sales of paper were difficult to negotiate, a scarcity of money was experienced, and the shareholders' payment was reduced to 8 per cent. per annum. The mill, owing to its sound policy and strong position, however, safely weathered the crisis.

Sven Magnus Sunnerdahl acquired the mill in 1825, and he displayed great enterprise in taking advantage of certain inventions introduced about this period, with the result that production in 1830 was increased to 13,000 reams annually, and output achieved a reputation of being better than any other mill in Sweden. At this time there were 91 mills in the country, and of the total production Klippans mill was responsible for 7 per cent. and in value 9 per cent. The mill had in Denmark an excellent market.

Following the example of the Strandmöllan paper mill, which, in 1829, erected a paper machine which enabled manufacturing operations to be greatly extended, Sunnerdahl had a Fourdrinier installed, receiving a subsidy for the purpose. The first paper machine in Sweden, therefore, came into use on June 20th, 1832, and Klippans mill was the pioneer in this development. By 1840 the output was increased from 80 metric tons hand-made to 250 metric tons machine-made paper, mostly writing paper of high quality.

Chr. A. Bock, in 1853, became the proprietor of Klippans mill, the largest in Sweden. The Crimean War stimulated demand, and the output reached 425 tons per annum, mostly printing paper, for which good prices were obtained. Printings constituted 80 per cent. of the annual production in the year 1870, but evidently competition was being experienced, as we find Klippans mill had to forego its title to being the largest mill in Sweden, the position being taken by Korndals paper Mill in Gothenburg.

Then came the introduction of wood fibres, which greatly increased the supply of raw materials. Wood grinding was introduced at Klippans mill in 1866, and Chr. A. Bock erected a second papermaking machine, and invested capital in providing railway communication to facilitate transit. Unfortunately, the heavy investments reduced his financial resources, and in 1881 liquidation was found necessary. At this time the output was news-print, with mechanical wood pulp as the chief raw material, the production being about 1,000 tons per annum.

On the death of Chr. A. Bock in 1885 the business was conducted by his three sons. The liquidation proceedings were wound up in 1889, and in the following year the Aktiebolaget Klippans Pappersbruk was formed. There followed a period of remarkable development in the Swedish paper industry. Specialised products were manufactured at the Klippans Mill, the finer qualities of papers taking the place of news-print. This involved a large expenditure in technical improvements and in increasing the power supply, and, as there followed a depressed market, the mill, with an unproductive capital, had to raise capital. Reconstruction was eventually decided upon. The Brothers Bock retired from the undertaking in 1900. The third machine was installed in 1905, and in 1908 there was an increase in share capital.

It was in 1911 that the Aktiebolaget Klippans Finpappersbruk superseded the old company. Proceeding on steady and conservative lines improvements were gradually introduced. Great assistance was rendered by Carl Cervin, who died in 1919. The policy inaugurated has been consistently followed by T. Cervin, the chairman of the board, and also by A. Alexanderson and other directors whilst the commercial and technical knowledge of C. J. Malmros, the general manager, and C. A. Eurenius, chief engineer, has been of the highest service; with the result that the company to-day is in a very strong position. The rebuilding operations, commenced in 1910, were completed in 1914. The equipment of the mill, a fourth machine having been installed, is thoroughly up-to-date in every respect, especially in its full power supply, as in addition to the Klippans and Forsmollen stations, the supply of the South Swedish Water Co. is available. The company also owns the Boksholms Sulfitfabrik, from which it draws its supplies. The productive capacity of the mill is 5,000 tons, comprising, in addition to printings and writings, such specialities as art tissue and coloured papers, crepe and wax papers. The home market absorbs 60 per cent. and 40 per cent. is exported.

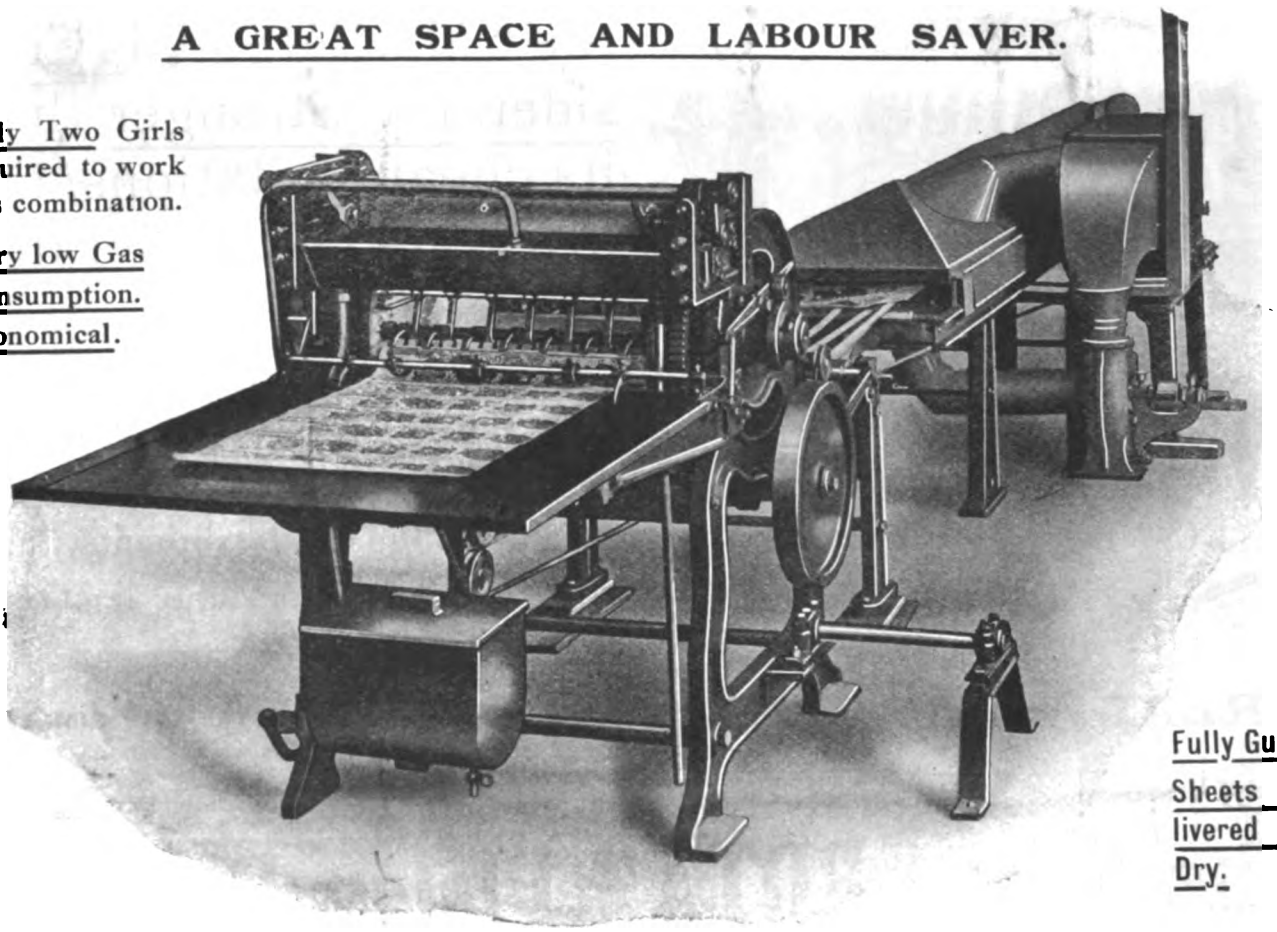
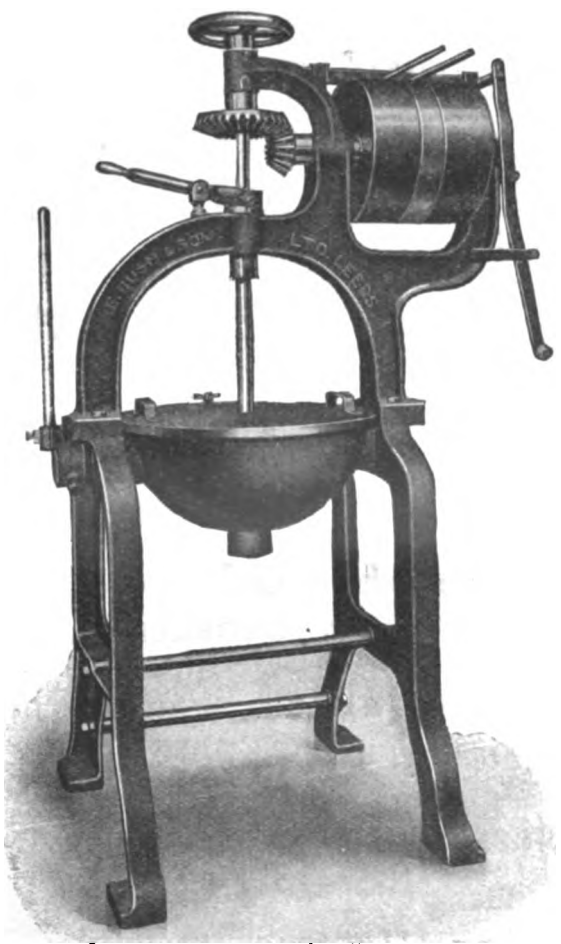
BUSH'S PATENT COMBINED



(Patented in Great Britain and Abroad).

Varnishing and Gumming Machine and Hot-Air Drying Apparatus. (Patent No. 141,997).



A GREAT SPACE AND LABOUR SAVER.

Only Two Girls required to work this combination.

Very low Gas Consumption. Economical.

Fully Guaranteed. Sheets are Delivered Perfectly Dry.

The above illustration shews both our machines combined, but we can supply either machine separately.

Made in 4 sizes, D. Crown to Quad Demy.

Supplied to many of the leading Printing Offices at Home and Abroad.

*

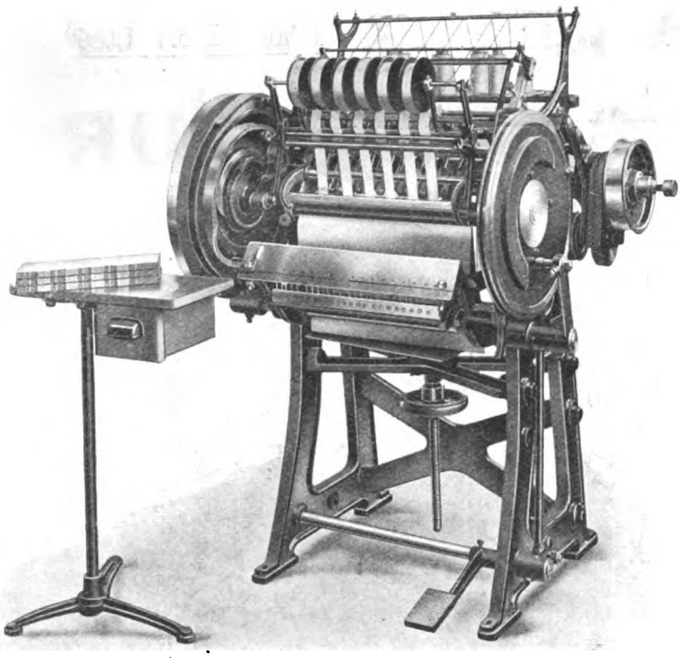
Bush's Patent Ink Mixing Machine

(Patent No. 8,623).

The only Machine fitted with Tilting Bowl, Removable Blade, etc. Blade can be reversed by moving belt handles either to left or right.

Illustration shewing Machine in operation.

Made in 2 sizes. For 75 lbs. Colour or 150 lbs.



Its Good Points.

1. Economical.—Old Ink can be speedily restored to working consistency.
2. Strongest Inks and Varnishes are thoroughly amalgamated with the greatest of ease.
3. Dispenses with old slow process of Hand Mullering and Blending.
4. A Machine which requires no special attention.

THE BRITISH & COLONIAL PRINTER AND STATIONER

FOUNDED 1878. PUBLISHED WEEKLY.

WITH MONTHLY SECTION FOR THE BOOKBINDER.

The Recognised Organ for Printers, Printers' Engineers, Wholesale and Manufacturing Stationers, and Makers of Machinery and Appliances for the Paper Bag, Envelope, Box-making, Bookbinding and all Paper and Board Consuming Industries.

VOLUME 93. NUMBER 10. [REGISTERED AS A NEWSPAPER.] LONDON: SEPTEMBER 6, 1923. Special Export Issue. 4d.

Export Notes and Comments

State of Export Trade.

IT is regrettable that the steady improvement of this country's export trade maintained since early in the year should have given place to the sharp decline indicated in the figures for July. The paper trade certainly shares in the retrograde movement, and, so far as we can ascertain, exports of manufactured goods relating to the printing and allied trades have in general suffered similar set-back. Though it is too early yet to decide whether this decline is merely temporary or of a more lasting character, the recent healthy tendency of British export trade gives ground for hope that a mitigation of the present chaos on the Continent would be quickly followed by an upward bound in our export figures.

Impeding Influences.

THE dock strike was doubtless responsible for much of the decline shown in the July figures, and so far as that is concerned the set-back should be temporary only. The European situation, however, is another and a much more serious factor. France is demonstrating to the world, to our cost, that the industries of one nation cannot be destroyed or crippled without detriment to international trade as a whole. It is becoming plain that the invasion of the Ruhr is the stoppage of an artery in the world's industrial organism and that every member of that organism shares, in greater or less degree, in the disorder and enfeeblement which such a thing entails. It is to be hoped that the Government will attach due weight to the recent statement on this subject by the Federation of British Industries. As the F.B.I. committee reported, the assumption is untenable that the economic difficulties of this country can be entirely solved by rapid and considerable development of trade with the Dominions, and that in Empire markets will be found the means of restoring trade lost in other parts of the world. If we assist or countenance the disruption of any industrial country, we aid in our own impoverishment. The great desideratum now before us is the re-establishment of sane relationships on the Continent.

Trading with Canada.

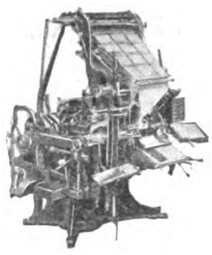
AFTER an official tour made by Mr. F. W. Field, H.M. Trade Commissioner at Toronto, to cities and towns in Western Ontario, Mr. Field reports that business conditions are gradually improving and British manufacturers have made some headway recently in securing a share of Ontario's import trade. He strongly recommends a personal visit of United Kingdom manufacturers to the Ontario market, in order to appreciate fully the difficulties which United Kingdom manufacturers have to solve in order to secure a profitable amount of the business offering. Indeed, he states that unless the United Kingdom manufacturer is fully conversant with what is termed the "selling atmosphere" of the market, little success is likely to result from efforts to establish or extend trade in that particular market. A number of United Kingdom manufacturers are believed to be considering the matter of branch works in Canada, particularly in Ontario and Quebec Provinces. It has been suggested that United Kingdom firms establishing works in Canada should consult the Trade Commissioners in regard to other branch houses there, in order that equipment and supplies may be purchased as far as possible from other United Kingdom firms in Canada, rather than from foreign suppliers.

British Agents in South Africa.

A CLOSE watch on trading developments is maintained by the British Manufacturers Representatives' Association of South Africa (Incorporated). In the half yearly report dated June, 1923, there is ample evidence of its watchfulness, and the Association should be of much utility to those wishful of cultivating the African market. One matter which receives much attention is the interests of representatives in South Africa of British firms. In regard to tenders for supplies for Government departments and public bodies, communications have recently been addressed by the Association to several Government departments with a view to obtaining some kind of preference for oversea firms permanently represented in South Africa over firms not represented there and having no stake in the country, their representations having special reference to tenders called for through the High Commissioner in London. As, however, the replies received were evasive and very unsatisfactory the Association asked the Government to receive a deputation on the subject. The deputation was received, and full consideration is now being given to the Association's representations.

A South African Grievance.

A GRIEVANCE to which this Association draws attention concerns the practice adopted by certain auctioneers or dealers in importing cheap bankrupt or other stocks from abroad and auctioning them on the South African market to the serious detriment of representatives and legitimate importers. It is stated that there appears to be no way of checkmating this evil so far as the existing licence laws are concerned, whilst the difficulty with which the Customs authorities are faced is that the goods are invoiced at the true home consumption value whatever may actually be paid for them. Consideration is, therefore, being given to the question of representations to the Government with a view to the introduction of suitable legislation. The Association states that information is to hand that at least one leading firm of London shippers is regularly supplying goods to an auctioneer in South Africa for disposal. They emphasise the damaging effect of such shipments on the business of regular importers.



The Australian Market.

THE High Commissioner for Australia is anxious to refute the fallacy that Australian trade policy hampers British manufacture. He thinks it is time the British people realise that the British manufacturer, assisted by the preference afforded to British goods, is in a far better position with Australian markets than he would be if these markets were open to the free competition of the whole world. In support of his view he has published certain statistics which have been compiled from official British sources, the object being to show the value of the Australian market, compared with its population, for the manufactured goods of the United Kingdom.

Importance of Australia's Custom.

Figures quoted by Sir Joseph Cook show that India, with a population of 320,000,000, took British goods to the value of £91,621,301 in 1922 and £70,273,221 in 1913. The United States, with a population of 110,000,000, absorbed British goods to the extent of just over 55 million pounds in 1922 and 29¼ million pounds in 1913. Germany, whose population is put at 65½ millions, received British goods to the value of just over 32 million pounds in 1922 and 40½ million pounds in 1913. Then France, with a population of 40 millions, imported 48 million pounds worth of British goods in 1922 and 29 millions in 1913. Coming to Australia, however, we find that with a population of roughly 5½ millions, the imports of produce and manufactures of the United Kingdom in 1922 were valued at £60,457,294, and in 1913 34½ million pounds. In the second table Sir Joseph Cook shows the estimated percentage of manufactured goods only in the totals given in the above figures. The percentages

ARE YOU SETTING
YOUR DISPLAY
COMPOSITION
?

If you will permit us to do so, we can show you by actual demonstration that the Linotype can set, to your full satisfaction, the whole of your display work (whether it be general jobbing, title pages of books, etc., or headlines and displayed advertisements for your newspaper), up to and including 36-point, in the best and most economical way.

Linotype & Machinery Ltd.
9 Kingsway
London

were as follows: Australia 95, India 94·5, United States 69, France 58, Germany 52·8. The High Commissioner adds that it is generally realised that the export of fully manufactured goods is more valuable to a nation than the export of raw material or partially manufactured goods, and he had the figures compiled in support of his views. Reviewing trade and industry all round, we are bound to come to the conclusion that British manufacturers possess a valuable asset in Empire markets.

The Indian Market.

CONDITIONS in export trade with India are made difficult not only by the general depression in trade and by the competition from Continental and other countries but also by the strained political situation which has led to some prejudice against British goods. It is satisfactory to note, however, that in so far as detailed returns are available in respect of the allied trades, 1923 figures show an improvement upon those of the previous year. That fact encourages the hope, especially if the desired amelioration of national feeling can be brought about, that the large and growing field in India for the consumption of printers' supplies may provide commercial intercourse mutually beneficial to British exporters and the Indian printing industry.

Printing Presses in Egypt.

THE use of the printing press is growing steadily in most countries, and not least in those where political propaganda is a strong force. Egypt, therefore, like India, is employing print in ever larger measure. Privately owned presses, we are told in a report on the Economic and Financial Situation of Egypt issued by the Department of Overseas Trade, for printing books, commercial stationery and newspapers, and establishments for lithographic production, abound, and are for the most part in native hands. In the large majority of cases native labour is almost entirely employed, even in the production of European newspapers. The publications issued by the Government Press, and the official maps and plans produced in colour and otherwise by the Survey Department are of a high standard of excellence. There is thus a fair market for British printing supplies, while paper and printed matter form a conspicuous feature of imports. In recent years there has been a falling off from the average under this heading. For instance, the average value of the paper and printed matter imported between 1917 and 1921 was £E1,325,379, whereas the actual value of imports in 1921 was £E998,545, and in 1922 £E909,789. Exports of the same class of goods, of course, do not reach such high figures, but here also the average of 1917-21 (£E145,901) has not been reached of late. In 1921 exports were of the value of £E106,801, and in 1922 £E70,881. The reasons for the declines in these totals are doubtless trade depression, the political changes which have recently taken place, and the prejudice which seems to exist against everything British. The market is, however, one with considerable possibilities.

Printing Inks for the Argentine.

THE Argentine offers a field in which British manufacturers of printing inks could do more business if the market were more thoroughly cultivated. A recent consular

Digitized by Google

report indicates that upwards of 1,000,000 lbs. of printing and lithographic inks are used annually in Argentina, 80 per cent. being imported from the United States. It is estimated that two of the principal daily papers alone consume between them 120 drums of black ink monthly. The trade is controlled largely by local branches of American and European factories, which import the inks in barrels and prepare them for market. British suppliers seem to do less business than the qualities of their products deserve. To compete successfully with United States exporters it is desirable to forward inks in bulk, as the saving of about 5 cents per lb. more than compensates for the cost of preparation and packing. In addition, the tropical heat of the country injuriously affects all inks that are imported ready prepared.

Brazilian Trade Awakening.

The demand for print and for printers' supplies of every kind varies in very direct fashion with the state of general trade, and there can be no question, therefore, that the printing trade in Brazil is on the up grade at the present time. Big railway and power developments are in progress in that country, and the engineering, the lumber and woodworking and other industries are experiencing something of a mild boom, which must necessarily be reflected in Brazilian printing offices. British traders would do well to utilise the opportunity offered for a forward movement in the promotion of their sales in that market.

Inquiries Regarding Trade Openings.

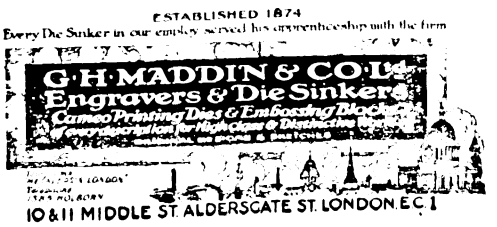
In Brazil, however, it will take time for enterprise to reap its full reward. Though the position is promising and future prospects excellent, buying is handicapped by the depreciated exchange and it would seem to be unwise just now to do more than make sure of a footing and perhaps maintain a small stock of supplies. Importing merchants are reported to be keeping at present only reduced stocks of overseas goods. There is, however, a marked preference for British products as against those of many other would-be importers, and business is sure to materialise. Those who are looking to this market would be well advised to avail themselves of the commercial intelligence service of the Department of Overseas Trade and of the British Chambers of Commerce in Rio de Janeiro and elsewhere. Through these agencies British firms can obtain reliable information as to the state of the market in regard to particular lines of goods, also advice as to the best methods to adopt in utilising the opportunities that occur.

Growth of China's Press.

One of the most notable signs of the extension of Western civilisation in China is the rapid growth to be seen in that country's Press. Ever-increasing demand is being made upon the art of printing and upon the printer's supplier. Whereas China possessed only 31 daily newspapers before the anti-monarchical movement started, there are now about 800. Peking alone has 75 or more dailies in the Chinese language, and a growing periodical Press as well. Further development is promised by the fact that Peking is now to have a School of Journalism, which is to be modelled upon the Pulitzer School of Columbia University, New York, and the endowment will include provision for travelling fellowships and scholarships. This is indicative of the big possibilities which lie before the printing industry in China.

China Wants Printing Inks.

Though the market has special difficulties, there is room for more enterprise on the part of British printing ink makers in respect of the demand in China. That huge, slowly awakening country already consumes, according to Chamber of Commerce information, printing inks the annual value of which aggregates about $800,000, and is used for the most part in lithographic work. The great demand in the printing trade is principally in respect of posters, calendars and labels. Japan predominates as a supplier to this market, supplying 55 per cent, but America exports about 30 per cent. of the total quantity consumed, while European countries share to the extent of 10 per cent. Competition is so keen that it is necessary to carry stocks locally—a heavy undertaking for European and American firms. Black ink is most in demand, but there is a ready sale for bright colours, especially red, blue and yellow. Green and violet inks are also in small demand.



Trade with the United States.

Not all those who have specialities which can command a market in the U.S.A. know of the valuable aid offered to the British trader by the British Empire Chamber of Commerce in the United States of America, Inc. This Chamber was established to facilitate and encourage commerce between the United States and the British Empire, and can in many ways render good service to British firms desiring to enter the American field. Amongst the facilities offered are: Assistance in the securing of agents or in the establishment of connections; arbitration facilities; business introductions; information and assistance regarding incorporation procedure; statistics of production and foreign trade; trade reference library; general trade information, office facilities, etc. Enquiries by mail are welcomed and every effort made to supply expeditiously the information desired. The Chamber would be glad if British traders would send from time to time catalogues of latest issue. These are displayed where they can be seen by visitors, and are also used by the Chamber when names of British exporters are requested. The office of the Chamber, to which enquiries or catalogues should be addressed, is in Cunard Buildings, 25, Broadway, New York.

The British Empire Exhibition.

A big boost will certainly be given to British export trade by the British Empire Exhibition to be held next year at Wembley. The printing and allied trades will be specifically represented, the committee which has charge of this section of exhibits being under the chairmanship of Mr. R. A. Austen-Leigh, ex-president of the Federation of Master Printers. Our colonies and other overseas connections are showing keen interest in co-operating in this gigantic exhibition. Canada has taken possession of her site at Wembley Park and work is well in hand. The cutting of the first sod, by Lady Allen, of the New Zealand Pavilion, took place on July 30th. The foundation stone of the Australian building was laid on July 31st by Sir Joseph Cook. It is announced that all the space available for commercial and industrial exhibits in the Indian Section has been allotted. The first sod of the Bermuda site was cut by Sir James Willcocks, G.C.M.G., on July 27th. Trinidad Legislative Council has voted £10,000 for the Colony's participation in the Exhibition. Singapore has arranged with the Exhibition Authorities to exhibit living specimens of animals from the Malay Peninsula. British Guiana has decided to form part of the West Indian and Atlantic Group and is spending £7,000 on her share of the Pavilion. The East African Committee has authorised the signature to a contract for a building covering 15,750 square feet. The Legislative Council of Fiji has requested, pending the official report of the Local Committee, that a floor space of 2,000 square feet be provisionally reserved for the use of the Colony, but it is hoped that this amount will subsequently be increased. Out of a total of 513,137 square feet net, or approximately 850,000 square feet gross, *i.e.*, including gangways, etc., a balance of only 45,361 square feet had not been applied for at the end of July.

The Quebec Government has decided to establish a school for printers, says *The Times*, in which there will be a practical course for training printers in all branches of the trade. In regard to the attitude which the typographical unions and affiliated bodies may take towards the project, Mr. Fusk, the president of the Quebec Union, says:—"The unions are not likely to object so long as the school is not used to turn out strike breakers." The action of the Government recalls the strike of printers during the Session of the Legislature in 1922, which prevented the publication of official records.

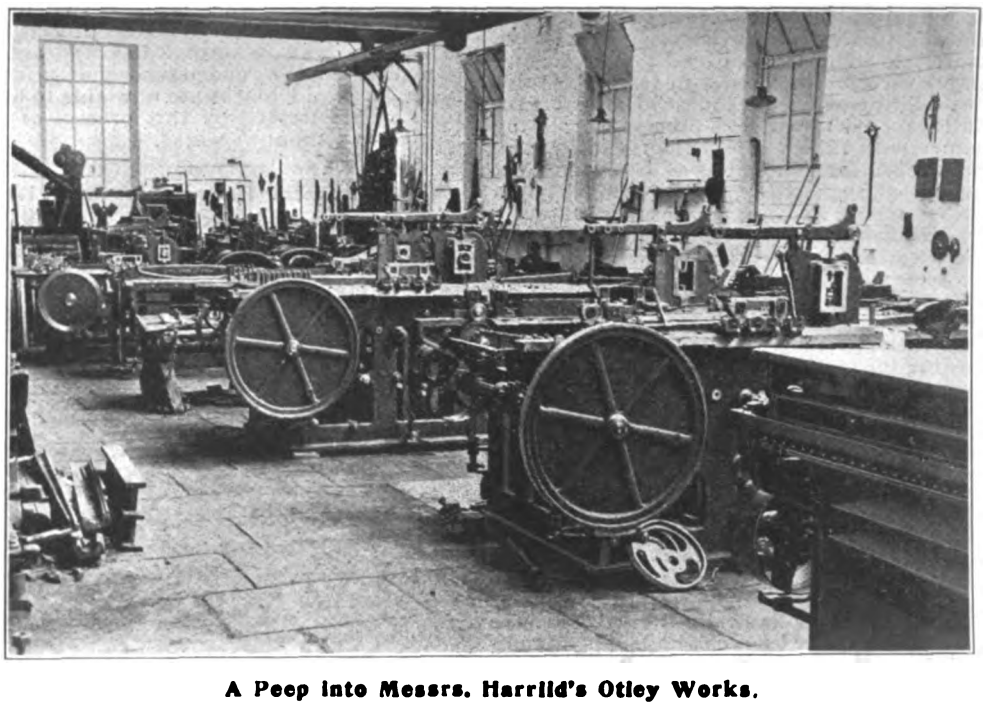
Up-to-Date British Machinery

for the

Printing and Allied Trades.

One still occasionally hears the complaint' all too common some years ago, that British manufacturers of machinery are too much inclined to adhere to their favourite patterns, and are not quick enough in adopting improved designs or modifying their products to suit the special requirements of overseas buyers. Happily there has been much improvement in this respect, and British suppliers are showing increased adaptability and wide-awakeness to the demands of the hour. There is still sound sense, as there always has been, in the argument of the British maker that there is often an advantage in his unreadiness to adopt every plausible new idea or designer's fad that may temporarily occupy the spotlight. So many of these fads and fancies have "had their day and ceased to be," whilst many of the old, sound, time-tested methods of the British manufacturer continue with little or no modification to hold an unquestionable supremacy. Some of the old conservatism, however, is going, and British firms, whilst endeavouring to maintain their established reputation for quality, are advancing in the direction of increased diversity of designs to meet new demands. This country, which has contributed so much to the origination and development of printing machinery, still jealously guards its name for producing machinery on sound, well-tried-out principles and of reliable and durable construction, but the increase of enterprise and business flexibility has been such that to-day there are few types of machines of real value to the printing and allied trades that cannot be had from the home manufacturer.



This thought came forcibly to one's mind the other day in glancing round the showrooms of Messrs. Harrild and Sons, Ltd., at Norwich-street, Fetter-lane, London, where are to be seen a remarkable variety of machines for printers, bookbinders, box-makers, etc. That the Harrild machinery is actually made in this country, and made on an extensive scale, will be gathered from the interesting photographs which, by courtesy of Messrs. Harrild and Sons, Ltd , we are able to reproduce herewith. Both illustrations are of the firm's works at Otley, Yorks, and provide two little glimpses inside the workshops, where, it will be noted, cylinder machines can be seen in course of construction.

Manufacturing Cylinder Printing Machines.

At their Otley Works, and at their "Fleet" Works, Norwich-street, London, Messrs. Harrild and Sons, Ltd., have done much to show that in inventive ability and constructive skill this country can hold its own with its rivals.

In respect of heavy art platens, for instance —a line once left to Continental enterprise— Messrs. Harrild have for some years been building one of the latest types of machine; the Harrild art platen is a substantial and efficient piece of apparatus which does credit to any printery. Again, Harrild's "Orient" overhead-feed stop cylinder press is designed on the same lines as the well-known Continental makes of this pattern, and it incorporates advantages of the Harrild improved Wharfedale machines, such as the double brake to the cylinder and special devices for obtaining dead register; the inking apparatus is also much simplified and improved. In printing presses, indeed, this firm produces a wonderful range. Their cylinder printing machines—notably the registered "Bremner" Improved Wharfedale and "Rapid" Cylinder Job Press, not to mention platen printing machines from the small 11 by 7 jobber up to the heavy double-geared 21 by 16 fine art process and three-colour platen—embrace practically everything that can be required in the machine departments.

A Peep into Messrs. Harrild's Otley Works.

For the bindery and warehouse they have an equally comprehensive range of machines, including guillotines, pagers and perforators, blocking presses, folding machines, etc. Their self-clamp guillotine (which we have seen in their well-equipped show-rooms) is of special design, being double-geared, exceedingly powerful and rapid in action; and the simplicity of construction, owing to the elimination of all bevel gears, etc., puts this machine in a class by itself.

In respect of box-making, also, Messrs. Harrild are developing a line hitherto neglected by the British manufacturer. They are making cutters and creasers and other subsidiary apparatus, in addition to a fine two-colour box board printer.

All Messrs. Harrild's heavy machines, such as mentioned above, are manufactured in their Otley works, and their Stamford-street works in London are devoted more exclusively to the manufacture of the paging and perforating machinery, stereo and electro foundries and their special three-sided heavy clamp trimming machine for periodicals. It may interest our readers to know that the Amalgamated Press alone have 14 of these fine machines running in their publication departments.

The Norwich-street showrooms are well worth a visit from home and colonial visitors interested in machinery developments, and we believe that inquiries directed either to the company's London offices or to the various agents who represent the firm overseas are assured of prompt attention, whilst those who wish to make a personal investigation of Harrild products will be met with that courteous spirit of service which is so important to the establishment of cordial business relationships and the extension of British trade.

True worth laughs at tinsel splendour.

What our Manufacturers are Doing

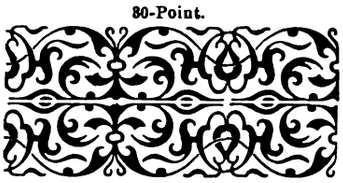
British Machinery and Other Products that Merit the Attention of Overseas Buyers.

Rubber Latex Papers: Lepard and Smiths.

A recent papermaking development which has aroused a great amount of interest in both technical and non-technical circles is that of the addition of rubber latex to papermaking materials in order to give to the resulting paper certain advantages in respect of folding qualities, etc. Like most ideas of a revolutionary character, the process of treating paper with rubber latex was regarded with scepticism, and doubt was cast upon the utility of such paper. This innovation in papermaking had not, however, been lightly undertaken, as during a long period tests had been carried out by Mr. F. Kaye, A.R.C.Sc., to determine the value of the improvements effected in paper treated with rubber latex. Printers, stationers, and other large users have had the opportunity during recent months of testing the merit of such papers, and the most indisputable tribute to their utility is provided by the keen demand for supplies; also by the rapidly increasing sales on the part of those firms who realised early the potential value of this invention.

Paper and Stationery Supplies: Spicers Limited.

Paper in great variety is of course a *sine qua non* of the printing business, and the printer is well advised to have behind him a source of supply competent to provide any of the multitudinous lines for which demand may at any time be made. Prominent amongst supply houses of the utmost capacity and resource is the world-renowned firm of Spicers Limited, who are continually adding to the great range of papers which they manufacture. On another page will be found an announcement in which Messrs. Spicers indicate some important items which they are able to offer to meet the needs of printers and stationers in all parts of the world.



Three and Four-Colour Process: Nickeloid Electrotype Co., Ltd.

We are not surprised to learn that the Nickeloid Electrotype Co., Ltd., of 10, New-street-hill, London, E.C 4, find that printers are taking an increasing interest in their new process, whereby three and four-colour block work is made to produce prints uniquely resembling watercolour paintings. The principle of the method employed is the partial removing, by a secret process, of the coating from the surface of art or chromo papers. We say "partial" removing, for obviously there could be no gain in printing on paper which had been specially coated with china clay, etc., in order to fill up the interstices of the surface and permit of its receiving the detail of fine half tone blocks, and then removing the coating—and with it the detail. The fact is that the Nickeloid process makes it possible to bring out the full detail of the blocks by printing them on coated paper, and then to remove the coating of the paper only in so far as the surface has not been inked in the printing; that is to say, all the superfluous coating in the picture itself and around the picture is removed, thus destroying the objectionable glare associated with art paper, but such parts of the coating as have been printed upon are protected by the ink and remain, the full detail of the picture being therefore retained. The beauty of effect which can thus be produced has to be seen to be believed. The wonderful capabilities of the three and four-colour process are revealed afresh, the result possessing the attractive "wash" effect that is obtained by offset printing, yet retaining a wealth of accurate detail that cannot be so well achieved from a rubber printing surface. In personally inspecting this process we have been agreeably impressed by the comparison of two reproductions from an identical series of blocks, the one as ordinarily printed on coated paper and the other after the decoating process. The two prints produce quite different impressions. The one with the shine on the surface is obviously a print, whilst that which the Nickeloid process has left with a matt, Whatman-like appearance is a picture. We understand that printers using Nickeloid blocks are now able to have their prints treated by this process at the Nickeloid company's works.

Typographical Decorative Material: Linotype and Machinery Limited.

Amongst the most interesting of recent developments in connection with Linotype typography is the introduction of new decorative material, some of which we are able

80-Point.

24-Point.

18-Point.

18-Point.

18-Point.

18-Point.

18-Point.

to illustrate herewith. Such additions to the already extensive resources which the Linotype possesses in this direction include a series of flower borders which are delightful both in artistic value and in the adaptability which enables the printer to produce with their aid an infinite range of decorative designs. Especially when these are executed in colour can some remarkably pleasing effects be produced.

Envelope-Making Machinery: David Carlaw and Sons, Ltd.

The manufacture of envelopes is an important branch of the allied trades, and those who wish to extend business in this direction are being increasingly catered for by British engineers. A foremost firm for this class of machinery is the well-known Glasgow house of David Carlaw and Sons, Ltd., who are continually improving upon their already established reputation. We learn that they are at present completing two new machines, viz., a power gumming machine, and a machine for fixing transparent windows to envelope blanks. Both these machines are to run at a very high speed, and will be of much interest to all who manufacture envelopes.

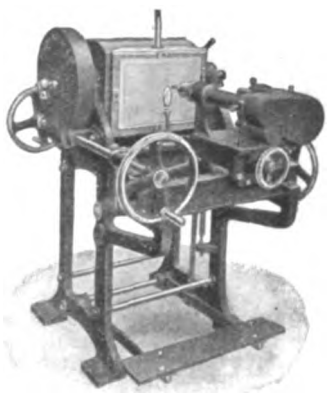
Photo-Engraving Machinery: Hunters, Limited.

Well to the fore in catering for the requirements of overseas printers is the well known London firm of Hunters, Ltd., which must be credited with notable activities in the production of photo engraving, stereotyping and electrotyping machinery. Before the war, Messrs. Hunters used to import these goods from Germany, but they are now manufacturing them themselves. They give special attention also to photo-lithography, and manufacture all the necessary plant for this branch of printing. Moreover, Messrs. Hunters, Ltd., are actual manufacturers of process-engraving copper, zinc, brass, for photo-engraving and nameplate work, etc.

Ruling and Perforating Machinery: John Shaw and Sons.

All who are interested in machine ruling are familiar with the name of this Honley firm, amongst whose manufactures is the "Super-Imperial" four-sider disc ruling machine, for feint lining only or feint lining and striking, two, three or four colours on both sides of the sheets, both ways, at one operation. Messrs. Shaw supply this machine either with their latest model ream feeder, patent pile feeder, or patent pile suction feeder attached. They recommend this machine with patent pile suction feeder attached, and state they are prepared to guarantee this machine with suction feeder to be the best and fastest disc ruling machine in the world. The feeder will feed any class of paper, from manifold to thin cardboard, and the machine completes the sheets, ruled on both sides both ways, at one operation. The layboy or delivery box is much improved, and jogs the sheets perfectly true and accurate both at the sides and at the back. The side joggers ensure the sheets being knocked up perfectly straight. The suction feeder can be added to the same makers' well-known striker pen ruling machines, also to any other make of ruling machines, either pen or disc. It can also be added to folding machines. Regarding Messrs. Shaw and Sons' "New Imperial" rotary perforating machines, they can supply creasing cutters for creasing any kind of pattern on these machines. They have recently made three or four different kinds of creasers for creasing different patterns, and can supply these creasers to suit customers' requirements if samples are sent with inquiries. This is a very versatile machine, as it will do fine perforating, slot perforating, knife perforating, scoring, creasing and slitting. It is a most accurate machine for striking work.

Bookbinding Machinery: Smyth-Horne, Ltd.



The Smyth Manufacturing Co.'s line of special bookbinding labour-saving machines continue to be as attractive as ever to the general bookbinding and printing trade. Their line of book sewing machines, which comprises eight sizes and seven types, cover all the requirements of the book sewing trade. It is an interesting and commendable feature that the Smyth sewing machine will sew with the finest of cotton and also silk threads, which has always been found highly satisfactory when sewing thin paper sections, such as Bibles, diaries, etc., and the larger and heavier Smyth sewers are also capable of sewing not only the general run of stationery books, but also letterpress. A number of the Juengst section gathering, wire stitching and

Digitized by Google

automatic covering machines, which are supplied either in combination or as separate units, have been installed very successfully, and are giving every satisfaction. Another of Messrs. Smyth-Horne's popular lines is the new G. R. S. Rapid jobbing folding machine, which will make either one, two, three or four folds, and also has a three or four fold parallel attachment. It is designed and built to run at the enormous speed of 50-100 sheets a minute, according to the size and nature of the paper.

Stereotyping Machinery: William J. Light and Co., Ltd.

Some notable pieces of apparatus of special interest to stereotypers are offered by Messrs. Wm. J. Light and Co., Ltd., the sole agents in this country and the Colonies for the Swiss firm of Winkler, Fallert and Co. One of these is a very useful routing machine with horizontal cutter, for trimming both curved and flat stereotype plates. The carrier for the plates is made in one piece and is provided with curved and flat surfaces. Curved and flat plates can be fastened independent of each other and can be treated alternately as desired. The adjustment of the carrier for treating one or the other kind of plate only requires a few seconds. The fastening of the curved plates is done by a simple manipulation, and, owing to the handy character of the apparatus and the good arrangement of the cutter, the plate can be finished in half a minute. The horizontal position of the cutter, in contradistinction to other systems in which a vertical cutter is used, is one of the chief advantages of this machine. Opposite the cutter is arranged the flat plate, or the part of the curved plate to be treated in vertical position. A cooling jacket in the plate carrier cools the plate during the cutting operation. This combined router is shown in the accompanying illustration. The same firm handles the "Winkler" routing machine for flat plates, with horizontally working tool, whilst another item is the "Winkler" back milling machine, for finishing the backs of stereotype plates, etc.

Combined Router for Curved and Flat Plates.

Automatic Pile Feeder: H. T. B., Ltd.

There is no doubt that great attention is being paid to the possibilities of improving production and eliminating all unnecessary cost, and in this respect we think that now the possibilities of automatic sheet feeding are becoming recognised and appreciated. As is well known in the trade the "Slogger" method of sheet feeding has been established over 20 years and during this time many problems of sheet feeding have been solved by the adoption of the "Slogger" method. Messrs. H. T. B, Ltd., have just brought out a new model embodying Interchangeable Pile Board, and from the illustration to be found amongst our advertisers' announcements it is very obvious what decided advantages the printer now has at his disposal, in being able to move sheets either direct from stock room or anywhere about the works to the exact spot where he is printing—eliminating waiting to load up, and reducing to a minimum all unnecessary physical labour in handling, and also preventing spoiling and cracking sheets through needless handling. Special attention has been given to mechanical improvements on this model, so now it is quite easy to obtain speeds in sheet feeding which were not thought possible a few years ago. Of course the improvements in two-revolution and offset presses have brought the question of increased production to the front, and printers who desire a feeder combining speed with simplicity will find that the merits of the "Slogger" H. T. B. model appeal strongly to them.

Printing Machinery: A. Edler.

In addition to the "Marvel" book sewing machine, Mr. A. Edler sells the heaviest pattern of book sewing machine, for account books up to 18¾ in. width and 29½ in. length, and he undertakes to guarantee that the work done is at least equal to the best hand work, but more regular. Recently, too, he has also taken up a book sewing machine called the "Rapid," which is specially constructed for publishers' bookbinders, doing beautiful work at the enormous speed of 60 sections per minute. It is interesting to learn that the first two letterpress offset platen printing machines—to which we have previously referred—are on the way, and can be inspected in operation this month (probably the middle of September). With this machine no transfer process is necessary, nor any damping of the paper, and as existing blocks and types can be made use of, letterpress printers can themselves do certain offset work most economically, whilst offset printers will find the platen press very useful for small runs, which do not prove economical on rotary machines.

Printing Inks in Tins: Lorilleux and Bolton.

One of the most difficult problems connected with the export of printing ink overseas is that of preventing the ink skinning. One way is to pour a thin layer of special composition over the ink to prevent the formation of skin. This served its purpose well enough for a time, but did not seem to deal very effectively with what has always been a vexed question. Messrs. Lorilleux and Bolton, Ltd., pack their inks for export in a special patent tin, which Mr. Bolton patented after exhaustive tests in connection with the wastage of ink caused by ink skinning over when packed for export in ordinary tins. A description of the special patent export tin is given below, and should be of very special interest to colonial and foreign users of printing inks. If a tin of ink is not quite full when it is closed, the air in the tin will cause an undesirable skin to form on the top of the ink. Further, should the contents of the tin be shaken up in transit, the skin will break, and mix with the liquid ink, and after standing for some time, another skin will form. The tin must be filled as full as possible to avoid any air layer on top of the liquid. As inks vary in density very much, the use of ordinary tins was not possible if the skinning difficulties mentioned above were to be eliminated, and the special patent export tin used by Lorilleux and Bolton very effectually disposes of any possibility of the ink skinning before being opened by the printer. The tin has a false lid of thin tin which is soldered to the top of the tin. A lid proper fits over this which has a cutter attached. When it is desired to open the tin, the cutter which is attached to the lid proper is pressed through the false lid, turned with a circular cutting motion, which strips the false lid clean away, leaving the contents exposed ready for use. In filling, the tin is turned upside down, filled with ink, and a false bottom is pressed down hard on the ink until all air is excluded. A small hole in this false bottom allows all the air to escape. The hole is closed with solder. The base of the tin is then placed on, and is clamped fast with an overlapping flange by a machine, the contents of the tin are thus absolutely protected from contact with the outer air until the false lid is cut off in the manner described.

Printing Inks: Slater and Palmer.

The modern newspaper having developed some of the characteristics of a daily magazine, greater demands are being made upon newspaper printers in respect of inking, particularly as regards evenness of distribution and density of colour. With this in view, Messrs. Slater and Palmer have, after careful study, evolved a new formula to fill this requirement and this new make can be, and is being, adapted for use in tropical climates. This should be of interest to their colonial friends and others seeking a dense black clean working news ink. Messrs. Slater and Palmer have extended the same principle to the higher grade black inks for book, magazine and illustration work. Purity of ingredients, fineness of grinding and proper strength of medium, enable printers to get clear, sharp results on the finest screen work and bright effective finish. This firm, recognising that, throughout the East in particular, very much of the printing is still done by litho, have given close attention to this department in so adapting their medium as to carry the fullest body of colour and thus achieve solid bright results whether the work is done on the flat from stone or at offset from plates. Quality here is absolutely the first essential and that is Messrs. Slater and Palmer's object. The fact that this firm specialises particularly in inks for cheque, draft, bond and stamp printing should be of special interest to Government Printers in the colonies and elsewhere.

Empire Trade Resources.

At the second annual meeting of the Canadian Chamber of Commerce in London, the chairman said the forthcoming Imperial Economic Conference was naturally a matter in which the Chamber was very much interested. The economic position in Central Europe caused deep concern, and he was being strengthened in his conviction that the solution of the trouble lay largely in the development of closer trade relations between the various parts of the British Empire. It was all-important that the resources and trade of the Empire should be developed by British capital and experience. That was the line which had been followed by the Canadian Chamber of Commerce in London since its inception.

German Exports to England.

According to the Berlin correspondent of the Exchange Telegraph, German exporters are losing heavily on their exports to England as the result of the rationing of exchange in Berlin. The German Government compensates the exporters in paper marks for the 26 per cent. of the sterling price deducted in England for reparations, but when the exporter attempts to cover himself by buying back sterling with his compensation money he can get none and his marks rapidly dwindle in value.

Trade Notes.

Paper Merchant Charged.—Frederick William Skelton, 38, described as a paper merchant, residing in Links-road, Tooting Junction, was remanded at the Mansion House on Monday on a warrant issued in February last year charging him with obtaining sums amounting to £402 from Fleet-street printers by false pretences. Mr. J. L. Myers, prosecuting, said that as a result of these frauds several firms had become bankrupt. Detective Hayward said Skelton surrendered at the Moor-lane Police-station on Saturday evening.

Messrs. R. H. Jackson, Ltd., the well-known advertising agency of Manchester, have removed to more commodious premises at 1, Princess-street.

A New M.P.A.—The latest addition to the Master Printers' Associations of the country is the Association of Master Printers of South and East Devon. To attend the inaugural meeting of this association, Mr. A. E. Goodwin and Mr. J. D. Wise will travel down from London on Saturday to Exeter. Mr. H. F. Pollard, hon. sec. of the Exeter Association, and other prominent representatives of the South-Western Alliance are expected to be present.

Printers' Pension Corporation.—At a recent meeting of the Council of the Printers' Pension Corporation, held at the Almshouses, the Medical Officer reported the continuance of good health amongst the inmates. This is very gratifying in view of the great age of the recipients. There being no vacancy the customary Election in October will not be held.

The Printers' Miniature Bisley in connection with the Printing and Allied Trades' Charity Sports Association was held on Saturday, at the Ham and Petersham Rifle Range. The Championship of the Printing Trade was won by Mr. N. C. Headland, of the London Label Co., after a tie with Mr. J. G. Phillips. The Grand Aggregate was won by Mr. G. S. Booth, of the Amalgamated Press.

Institute of Journalists.—A large attendance is assured at the annual conference of the Institute of Journalists, which is to be held next week at Harrogate. On Monday the executive and the council will meet at Leeds, where a reception by the Lord Mayor will be followed by a musical evening. The conference will be opened at Harrogate on Tuesday, when a civic welcome will be given by the Mayor. On Wednesday the delegates will visit York, where they will be entertained by Messrs. Rowntree at their model village. At the Leeds University on Thursday the honorary degree of M.A. will be conferred on the president of the Institute, Mr. Frederick Peaker. The business at the conference will include a discussion of the proposed legislative restrictions on the publication of divorce suits and repulsive criminal cases, and consideration will be given to a proposal to extend the orphan fund (amounting to £30,000) so as to make some provision for widows.

The 68th annual international exhibition of the Royal Photographic Society will be formally opened at 35, Russell-square, on September 15th at 3 p.m., by Lord Riddell. The exhibition will be open to the public from September 17th to October 27th. Admission free. Illustrated catalogue 1s.

The death occurred on Friday of Mr. Shapland Hugh Swinny, president of the English Positivist Committee and editor of the *Positivist Review*.

Empire Exhibition Progress.—Rapid progress is being made with the British Empire Exhibition at Wembley. The Machinery and Industrial halls are nearing completion, while the Indian Pavilion will be finished by October, and the Canadian early in November. The foundation-stone of the West African Pavilion was laid on Monday afternoon by the Governor of Nigeria, Sir Hugh Clifford.

It is reported that a remarkably complete plant for the counterfeiting of American dollar notes has been found at Naples. According to the confession of the leader of the gang, he was in the habit of making the notes and forwarding them to the United States, where he was paid at the rate of ten lire to the dollar.

Trade Union Matters.

At the Trades Union Congress on Tuesday a discussion took place on the question of whether voluntary agreements on wages should be made legally binding. Mr. Naylor (London Society of Compositors) was amongst those who opposed the proposal on the ground that it would lead to compulsory arbitration. By an overwhelming majority the Conference rejected the principle that voluntary agreements should be registered and made legally binding by the Ministry of Labour.

Monotype Operators and Time Dockets.—At a recent meeting of the Executive Council of the Typographical Association correspondence was submitted by the secretary of the Redhill branch of the Association stating that a firm had attempted to introduce a daily time docket to be filled in by the linotype operators. As the operators were on piecework they had declined to fill in the dockets, and the firm had now withdrawn them.

Monotype Caster and Keyboard Operation.—The secretary of the Leeds branch of the Typographical Association recently asked the Executive Council for a ruling in regard to a monotype caster attendant who is a member of the T. A. but not a compositor, and wished to be trained as a monotype operator. The Executive Council has now announced that they cannot permit such a member to become a keyboard operator.

Apprentices and the Printing Trade.—The Executive Council of the Typographical Association have intimated to the secretaries of their branches the desirability of inviting consultation with parents proposing to place their sons as apprentices to the printing trade with a view to informing such parents of the rates of wages which should be arranged to be paid during the apprenticeship.

According to the "L.T.J." the number of L.S.C. members signing the out-of-work books during the week ending August 25th stood at 802, as compared with 820 in the previous week, and 778 for the week ending August 11th. Contrasted with the corresponding weeks of last year, the position, however, indicates a slight improvement. Thus, during the week ending August 25th, 1922, the number unemployed registered 1,124, against 1,104 in the preceding week, and 1,134 in the week ending August 11th, 1922.

In the same union the overtime returns for July show that of a total of 63,899 hours overtime worked, 51,656 hours were done by the general trade, the news department being responsible for 12,243 hours. The number of men working overtime in July in the general trade represented 4,996, and in the news department 1,245.

From the London Gazette.

PARTNERSHIP DISSOLVED.

G. H. Lawson and R. V. Shield, advertising and illustrating experts, 72, Carlton House, High-street, Birmingham, under the style of Lawson, Shield and Co.

THE BANKRUPTCY ACT, 1914.
RECEIVING ORDERS.

H. Dixon, 66, Chapman-street, and Dial-square, Victoria-street, formerly of 2a, Duke-street, Great Grimsby, box-maker.

Mr. S. Burrows, 45, Lake-street, Lower Gornal, Dudley, Worcester, paper merchant.

Trade of Bengal.—According to an official report on the maritime trade of Bengal during 1922–23 there has been some recovery in trade, which is taken to be a forerunner of still further improvements in the trade of the province generally. Stationery is among several articles that exceeded in value the imports of the previous year.

Messrs. Coates Bros. and Co., Ltd., of St. Bride's House, Salisbury-square, London, E.C.4, send us a further example in their series of sample cards "Coats of Many Colours." A brilliantly pictured naval uniform exemplifies the telling qualities of Messrs. Coates Bros' "Pure Blue" letterpress ink.

Government Contracts.

Contracts were placed with the following firms during July:—

H.M. Stationery Office.

Cloth, Tracing.—B. J. Hall and Co., Ltd., Manchester; Winterbottom Book Cloth Co., London, E.C.

Monotype Machines.—Lanston Monotype Corporation, Ltd., Horley.

Printing, Ruling, Binding, etc.

Printing, etc., Cardiff Prison Calendars, Contract for.—R. H. Johns, Ltd., Newport, Mon.

Binding 750 copies "Chronological Tables and Index to Statutes," 38th Edition.—Fisher Bookbinding Co., Ltd., London, S.E.

Binding 3,375 Naval Rate Books for Naval Stores; binding 10,000 copies Military Engineering, Vol. V., 1862, Telephone Directories, Vol. IV.—J. Adams, London, E.C.

Binding 7,000 copies Manual of Instruction for R.N. Sick Berth Staff.—Nevett Bookbinding Co., Ltd., London, N.W.

688,725 in 636 sorts, Form 64 E.—Metcalf and Cooper, Ltd., London, E.C.

520,325 in 712 sorts, Form 64 A., 52,125 in 217 sorts, Form 64 A. 1, 236,825 in 643 sorts, Form 63 B. (N.A.), 3,200 in 15 sorts, Form 63 N. (N.A.), 48,000 File 9/8 Inland Revenue.—W. P. Griffith and Son, Ltd., London, E.C.

19,325 Ships' Rotation Books, No. 243; 3,000 Skeleton Guard Books (D.475b); 16,000 File No. 1 Inland Revenue; 1,000 Skeleton Guard Books (D 476a); 785 Books, T.P 1063; 3,000 Books, A.B. 199; 3,200 Books, Form 341/T.L.; 10,000 Books, Form 620.—Waterlow and Sons, Ltd., London, E.C.

500 Books, D. 190.—Swiss and Co., Devonport.

5,500 copies R.A.F. Flying Manual, Part 1.—J. M. Dent and Sons, Letchworth.

Binding 2,000 copies "Irish Coast Pilot," 7th Edition.—Harrison and Sons, Ltd., London, W.C.

250 Books, D. 30.—Clements, Newling and Co., Ltd, London, E.C.

20,000 Note Books, Form 714.—Willmott and Sons, Ltd., London, E.C.

1,500 A.B. 183.—McCorquodale and Co., Ltd., Wolverton.

The Future of "The Times."

Trustees to Safeguard Policy.

The September *Empire Review* has an interesting article on "The Future of *The Times*," by its chief proprietor, Major the Hon. J. J. Astor, M.P.

"The public does not always realise that newspaper proprietorship is, in certain ways, a limited autocracy," writes Major Astor. "However alert the proprietor, he cannot escape the relentless pressure of two forces, that of his readers' expectations and opinions from without, and that of tradition from within." Major Astor discusses at length the special traditions of *The Times*, and points out that although it is easy for the owner of a newspaper to ensure there shall be no deviation from these inherited traditions during his lifetime, it is a different matter to provide for the continued application of those traditions after his death.

"One safeguard is, however, practicable. It is that those who are to be proprietors in the future should at least satisfy a competent tribunal that, as men, they are fitted for their responsibilities.

"To this end, it is being provided in the case of *The Times* that no person shall hereafter acquire an interest in its controlling shares unless with the approval of a body of trustees to be chosen from among the occupants of certain exalted positions in the community. In this way there will be substantial security that the historic traditions of *The Times* will not be changed unless for weighty and high-principled reasons."

The first number of *Ex Libris*, an illustrated monthly book periodical was published under date of July from the headquarters of the American Library in Paris.

THURSDAY, SEPTEMBER 6, 1923.

The Japanese Tragedy.

THE commercial world, like the world in general, is appalled at the catastrophe which has befallen Japan. In addition to the terribie loss of human life inflicted by the earthquake and by the attendant disasters, that country has suffered a paralysing blow to her industry and commerce. By the devastating of a large part of her most important business area—with tremendous losses in factories, warehouses, shipping, etc.—Japan receives an incalculable set-back to the prosperity she was rapidly achieving. The printing and allied trades must, of course, have suffered with the rest. News is already to hand of the the destruction of the great Nippon Printing Co.'s establishment at Tokyo, also of all the newspaper offices in the capital—with the sole exception of the premises of the *Nichi-Nichi*. It is taken for granted, too, that immense stocks of paper have been destroyed in the warehouses, whilst serious fears are entertained as to several paper mills in the vicinity of the disturbance. The need for practical assistance in the way of money and goods is overwhelming, and it behoves us all to give whatever aid we can through the relief channels which are now being opened.

The Trade Union Congress.

MOST of the leaders of printing trade unionism travelled last week-end to Plymouth to take part in the Trades Union Congress. The Congress meets in a very difficult time, and the proceedings have given evidence of less solidarity in the movement than might be desirable. One of the serious facts now facing trades unionism is that the membership of trade unions affiliated to the Congress shows a heavy shrinkage during the last three years. As far as the printing and paper trades are concerned, the membership in 1921 was 201,336, in 1922 173,157, and in 1923, 159,806. The crisis in the affairs of the *Daily Herald* is another cloud in the Labour sky. On Monday the delegates to the Congress sat in private to consider the fate of that newspaper. After Mr. George Lansbury and the editor of the *Daily Herald* (Mr. Hamilton Fyfe) had been requested to leave the hall, delegates were given full details as to financial and other considerations, and after a long deliberation the Congress decided to adjourn further discussion until to-day (Thursday), when another private session will be held, at which the fate of the paper will be decided.

Index Production Figure.

A GOOD deal is heard about the index figure for the cost of living, and the recent unofficial dock strike arose out of a calculation on that basis. A new suggestion is put forward that there should be an index figure for the value of the results of a fair hour's work. It is, of course, a pity that a suspicion should be so general that British workmen try to do as little as they can. But we are all measured by statistics nowadays, so that perhaps the suggestion referred to may not be unreasonable. Certain it is that a man should give full value for his wages just as he expects correct weight from his grocer. In making the proposal that there should be an index figure for the value of the results of a fair hour's work, it is recommended that this should be made the minimum in every trade, payment being made by results. If this was the practice, it is thought that most men would grade themselves, or move upwards, according to merit and ability.

Paper for Books.

FEW articles of commerce are used and abused so extensively and variously as paper. Its uses are infinite and its abuses are proportionately numerous. Even publishing interests have to take up the defence of paper in some cases. For example, a writer in the *Publishers' Weekly* (N.Y.) takes considerable pains to explain that books are not printed on regenerated news-print. The days when books were printed on pure rag paper are, of course, long past. The amount of fibre needed for the vast tonnage of printing to-day could never be produced by the gathering of factory cuttings of cotton or of second-hand rags. It is a common comment of book making that books are made on wood pulp paper. If by that is meant that they are printed on the stock designed for newspapers, the criticism is not valid. That statement was made in a recent article in *Collier's* by Samuel Hopkins Adams, who says that "Practically all of our fiction and much of our more serious book publishing is now done on secondhand paper repulped and cleansed from news-print." This is not the case, and neither new news-print nor re-vamped news-print is used on books, except in the cheapest paper-bound material, the appearance of which indicates that no attempt has been made to use book paper. Book papers, of course, vary in quality as would any material based on mechanical production from raw material. It is a mistake for those who are interested in book distribution to spread the impression that books are made on news-print paper, as such misinformation leads to hesitancy on the part of the public to buy books.

Print and the Paper.

EVIDENCES of enterprise among paper-makers and printers are constantly coming from across the Atlantic. A recent issue of the *Inland Printer* calls attention to one example of a very interesting character. It demonstrates the truth of the statement that "paper is part of the picture." The paper referred to was the cover of a house organ, the design having originated through the genius of Mr. Albert Springer, Junr., of the Edward H. Hall Co., of San Francisco. The

Digitized by Google

paper itself is an ordinary cover paper with a mottle tint. By the addition of the outline of a ship and the coastline in black, together with a disc representing the moon, a complete picture is represented of a picturesque harbour. Aided by the graded tones of the paper, the result is a picture giving all the natural effects of a seascape with the very minimum of printing. The cost, of course, is proportionately reduced. In the example referred to, the paper has been allowed to play its part in the picture, and the skill of the design is shown in the remarkable effect secured with perfect simplicity of treatment. Collaboration between the papermaker and the printer which is indicated might be carried further in this country.

* * *

A Paper-Cutting Plaint.

A little while ago we voiced a general complaint *re* unreliable count of reams. This time we must give expression to the opinion of many paper users on the mill cutting of paper. It is a very risky thing, though it should not be, for any printer or account book manufacturer to proceed straightway to print or rule a batch of reams straight from the wrapper, if there is an occasion to observe register. More often than not the mill reams of to-day are out of truth as regards square and variable as regards size. From the user's point of view, it is a serious and costly matter to have to trim the edges of a big making of paper. It should be unnecessary, if papermakers issued their reams as a perfectly finished commodity. Until the mills as a whole work to a finer standard of accuracy, it will remain a risky speculation for the user to disregard the condition of his paper as it arrives from the mill.

* * *

Foodstuff Wrappers.

The campaign that is being waged in some quarters for the more general application of hygienic principles in foodstuff wrapping is bearing good fruit, and already there is definite evidence of a spreading desire for bread served out in waxed and sealed wrappers. The largest bakeries have adopted various forms of wrappers and millions of loaves are now being delivered daily enclosed within a good-sized sheet of paper. There is room for tremendous development in other spheres and every fresh move means an increased consumption of paper.

Antimony Industry of Hunan.

Hunan has been producing antimony for over 20 years. Discoveries were made as early as 1897, and since that time new ones have been made yearly, according to reports from the United States Consulate at Hunan. The demand during the war greatly exceeded the supply, causing the price to soar to ten times its normal level. Hunan became a large exporting centre for antimony, and many mines and smelters sprang up over the province. The termination of the war resulted in a cessation of the abnormal demand and the price went down to a very low level. In the course of 1922, a slight improvement became noticeable, and the richest mines, together with those that cost the least to operate, are now being worked to their full extent. During 1921 there were 921 mines in operation.

Deposits of antimony are abundantly and widely distributed throughout Hunan. The districts around Packing, Anhwa, and Sinhwa are particularly rich in their supply of this mineral. Hsikuangshan, a hill in the Sinhwa district, is called Antimony Hill, because of the richness of the deposits found there. The antimony ore of Hunan is of a very highg rade, and is free from arsenic and other impurities. The antimony content of the ore runs from 20 to 65 per cent. Regulus exported by one company is stated to be 99.95 per cent. pure. The Herrenschmidt process is generally used in extracting antimony regulus. Since the demand for regulus has fallen off, antimony ore is manufactured into trioxide, commonly called antimony oxide.—*Journal of Society of Arts.*

Personal.

Lady Waterlow, who was accompanied by Alderman Sir William Waterlow, distributed the prizes at the annual sports last week of Waterlow and Sons, Ltd., at Headstone-lane, Hatch End.

The many friends of Mr. H. V. Chappell, president of the South-Western Alliance of Master Printers, will be glad to have re-assuring news of his health. Mr. Chappell, who has been for some time in a nursing home, is making good progress and is looking forward to a return to duty in the near future.

Mr. W. Whyte, secretary of the London Master Printers' Association, has returned from a very wet holiday spent in his native Scotland.

Mr. Montgomery Hennegin, who recently left the costing staff of the Federation of Master Printers to undertake organising work for the master printers of South Africa, has quickly got to work in his new sphere. Besides being busily occupied with meetings and interviews, Mr. Hennegin has issued the first number of a "Monthly Circular" initiated for preaching the gospel of scientific costing in South Africa.

Commander Oliver Lockyer-Lampson, M.P., the owner-editor of the *Empire Review*, was last week married to Miss Bianca Paget.

Mr. Hugh Mackay, formerly of the staffs of *Glasgow Herald* and the Amalgamated Press, London, has been appointed assistant manager of the *Liverpool Daily Post* and *Liverpool Echo.*

Mr. C. Curry, chief reporter of the *Lincolnshire Free Press*, has been appointed editor of the *Buckingham Advertiser.*

Mr. C. Lloyd Collins, of the reporting staff of the *Portsmouth Evening News*, has been presented by his colleagues on that paper with a travelling bag on leaving to take up a post in the Midlands.

Mr. Frank Rhodes, chief reporter of the *Croydon Times*, has been presented with a Jacobean clock from the staff of that journal and an electro-plated jug from the staff of the *Croydon Advertiser*, on his marriage to Miss Mabel G. Aburn.

Mr. H. A. Bromley, Examiner of Supplies to H.M. Stationery Office, on Tuesday night delivered an address on "The Evolution of Paper and Papermaking" from the London Wireless Station.

He gave a very clear and interesting review of the art from the earliest times to the present day, describing the methods and materials used in each stage of development.

Stationers' Social Society.

Autumn Golf Competition.

Particulars are now available of the Autumn Golf Competition which has been organised by the Stationers' Social Society. The Hendon Golf Course has been kindly lent for the occasion, and the competition will be held on Wednesday, October 3rd. The competition will be 18 holes against bogey, members to play under the lowest club handicap (handicap limited to 24). Entries close on September 25th.

Mr. Chas. Davidson, the president of the Society, has kindly offered a cup, which will be won outright.

The notice sent out in connection with the event states that "owing to the strenuous nature of business to-day and the difficulty of members being able to spare time for a whole day, it has been decided that the round can be played either in the morning or the afternoon, the first round for the day only to count in the competition."

A little water at the roots may help even the hardiest shrub.

Newcastle Municipal Printing.

Further Development Approved.

An important decision was made on Monday in connection with the municipal printing activities at Newcastle-on-Tyne. A week or so previously the special committee of Newcastle Corporation dealing with the question of the proposed establishment of a printing and stationery department for the Corporation, had under consideration a report from the City Treasurer (Mr. E. Darnell), showing an estimated saving on such a department of £2,534 per annum, which, with the estimated saving on the existing printing department of the Education Authority of £1,463, makes an estimated total saving of £3,997. Mr. Darnell reported against the proposal that the existing Education subdepartment should be enlarged so as to enable all Corporation departments to be supplied. He advanced several reasons, and added that the capital cost of equipping an additional department would not be very much greater than that of enlarging the existing sub-department, and the friendly rivalry of the two sub-departments working side by side and in competition would not be without its advantages.

On Monday the printing committee adopted the City Treasurer's report and passed it on to the City Council for confirmation.

Leeds Printing School New Session.

The winter session of the Leeds School of Printing, carried on under the auspices of the Leeds Education Committee, will open on Monday, September 24th.

In the letterpress printing department, the preliminary course, for junior apprentices under 18 years of age, provides instruction in English, composition, rules of punctuation, spelling, proof reading; and the drawing and design course, for students of the same age, will cover the principles of design, form, colour and ornament, with special reference to display composition. The elementary and advanced courses embrace typography, drawing and design, practical composition, cost finding and estimating. The case room provided for students in these classes is equipped with cases and frames for the accommodation of 18 compositors, and a large assortment of modern types, rules, borders and metal furniture, all on the point system, has been provided.

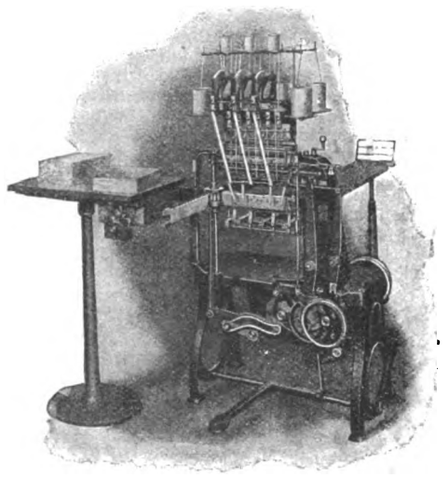
In the machinemen's section, the practical work includes the mechanism and adjustment of machines, making ready, overlay making, embossing, box making, cutting and creasing, and printing from type and blocks in monotone and colours. The equipment of the machine room includes the latest No. 4 Miehle two-revolution press, a Bremner Wharfedale, a Caxtonette platen and other platens. An adult class for three-colour printing will be formed if sufficient applications are received.

The school is equipped with four latest model linotypes and two D. monotype keyboards, one D D. keyboard, with display attachment, and skeleton caster for leads and rules. The courses in this section will consist of 12 lessons of two hours each.

The bookbinding department is equipped with a treble strider ruling machine, an Imperial disc ruling machine, by Messrs. John Shaw, and a range of machines by Messrs. Smyth-Horne for bookbinding, etc.

A special course of day classes, dealing with the broad principles of the printing trade has been arranged to meet the needs of apprentices, and employers are asked to encourage this additional training by allowing apprentices time off to attend the same.

The Master Printers' Federation and several printing equipment manufacturers have promised to provide prizes for the most efficient students in each section of the school.



Entitled "A Great Opportunity," a neat booklet has been issued by the Joint Industrial Council of the Printing and Kindred Trades pointing out the value of District Committees of the J.I.C.

Papeteries Anversoises, Belgium, nett profits for the past year 3,023,371 francs, against 2,281,962 francs in 1921-1922. The capital is to be raised from 6,000,000 to 9,000,000 francs.

Faraday, to develop and turn to account the invention comprised therein, relating to envelopes, and to carry on the business of advertisers, advertisement contractors or agents, printers, stationers, lithographers, typefounders, photographic printers, etc Private company. First directors: P. M. Faraday, E. J. Baumann and P. Gillet. Registered office: 34 and 36, Oxford street, W.1.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

EASTERN MORNING AND HULL NEWS CO., LTD.—Satisfaction in full on April 24th, 1923, of debenture dated July 14th, 1896, securing £2,000.

DERBYSHIRE COURIER, LTD.—Satisfaction to the extent of £1,400 on August 31st and £400 on October 13th, 1922, of debentures dated February 14th, 1913, and April 8th, 1915, securing £1,800. (Notice filed August 25th, 1923)

WALTER H. ROGERS AND CO., LTD. (wholesale paper merchants, etc.).—Debenture dated August 17th, 1923, to secure £1,550, and the amount of liabilities incurred by the lender in carrying on the business agreed to be sold to the company by an agreement of same date, charged on the company's undertaking and property, present and future, including uncalled capital (if any). Holder: A. Willmott, 14, Old Jewry Chambers, E.C.2.

E. A. OWEN, LTD. (booksellers, stationers, etc.).—First mortgage and second mortgage, both dated August 17th, 1923, to secure £1,000 and £400 respectively, charged on 192, County-road, Liverpool. Holders: Mrs. H. Jones, 7, Hatherley-street, Liverpool, and I. A. Swift, 165 and 167, County-road, Liverpool.

R. L. BEALL AND SONS (NEWCASTLE-ON-TYNE), LTD. (printers, stationers, etc.) — Issue on August 20th, 1923, of £250 debentures, part of a series already registered.

SOUTH LONDON PRESS, LTD.—Debenture charged on 1, High-road, and 4, Leigham-court-road, Streatham-hill, S.W., and the company's undertaking and property, present and future, including uncalled capital, dated August 17th, 1923, to secure all moneys due or to become due from company to Lloyds Bank.

FRED SPALDING AND SONS, LTD. (photographers, stationers, fancy dealers, etc., Chelmsford). — Particulars filed of £3,000 debentures authorised May 7th, 1923, charged on the company's undertaking and property, including uncalled capital; the whole amount being now issued.

COLLINS BROTHERS AND CO., LTD. (publishers, printers, stationers, etc.).—Mortgage created outside the U.K., dated April 27th, 1923 (supplemental to mortgage dated September 2nd, 1918), increasing the amount from £10,000 to £12,000 and the rate of interest thereon, charged on certain freehold property in Wyndham-street, Auckland, N.Z.

F. G. GREEN AND CO., LTD. (paper and envelope merchants and manufacturers, Southwark, S.E.).—Debenture dated August 20th, 1923, to secure £2,000 charged on the company's undertaking and property, present and future, including uncalled capital. Holder: F. C. Green, Union Bank-chambers, 16, Southwark-street, S.E.

DRAWING OFFICE SUPPLIES, LTD. (London). Satisfaction to the further extent of £6,000, on August 2nd, 1923, of debentures dated August 25th, 1921, securing £44,000.

GEORGE LEATHER AND SON, LTD. (paper stock and metal merchants, etc., Liverpool). —First mortgage debenture dated August 17th, 1923, to secure £150, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Mrs. F. Leather, 2, Cambridge-road, Wallasey, Ches.; and J. W. Parry, 16, Lichfield-street, Wallasey.

A Paper Merchant's Affairs.

Result of Depression in Trade and Falling Prices.

A sitting of the London Bankruptcy Court was held on August 28th, before Mr. Registrar Francke, for the public examination of Matthias Melchior Leopold Van der Bock-Boeck, who carried on business as a paper merchant and importer at 10, New Hibernia-chambers, London Bridge, under the style of "J. W. Cooper and Co." The receiving order was made last May on the petition of a creditor and accounts were lodged showing total liabilities £7,576, of which £7,019 are expected to rank for dividend, against assets valued at £101.

Replying to Mr E. Parke, official receiver, the debtor stated that he was a Danish subject and came to this country in April, 1900. In March, 1911, he purchased an egg and provision merchant's business, which he also carried on first at 8, Tooley street, S.E., under the style of "J. W. Cooper and Co.," removed in October, 1914, to 15, Duke-street, and in April last to New Hibernia-chambers. From December, 1916, until 1920, he was associated with another person (who financed the transactions under a verbal arrangement that profits and losses should be shared equally) in importing paper from Sweden. The business was successful until June, 1919, but subsequently, owing to falling prices, heavy losses were incurred. From 1916 until the receiving order, witness also carried on business as a paper merchant, under the style of "J. W. Cooper and Co." at the before-mentioned addresses. He attributed his failure to depression in trade, falling prices and bad debts.

Asked regarding a large purchase of paper from a Copenhagen firm, the debtor said his partner unsuccessfully endeavoured to dispose of the paper; the bulk of it was returned to Copenhagen, and was held there in a warehouse, whilst the balance was sold in London at a loss. Of his present liabilities £6,378 was due to his late partner under the sharing arrangement. Witness had £1,400 capital when he started the paper merchants' business in 1916, and the whole of it was lost, not in the partnership transactions, but in paper deals on his separate account. He had an expert knowledge of the paper trade, having been in that line of business in Copenhagen. At the present time he was employed as a salesman.

The examination was concluded.

Finnish Paper Mill Association.

Agents Appointed for Australasia.

Messrs Parsons and Whittemore have been appointed by the Finnish Paper Mill Association, of Helsingfors, exclusive sales agents for Australia and New Zealand.

Sales will be concluded directly between the buyers in Australia and New Zealand and the Finnish Paper Mill Association through the medium of Messrs Parsons and Whittemore's head office for Australasia in Sydney.

With the excellent organisation of Messrs. Parsons and Whittemore, no doubt the 23 mills forming the Finnish Association will greatly extend their trade with Australasia.

Print v. Paper Cricket Match.

"Observer" *v.* Messrs. W. V. Bowater and Sons, Ltd.

All who had the pleasure of taking part in the cricket match between teams representing the *Observer* newspaper and Messrs. W. V. Bowater and Sons on the ground of the former at Lavender-avenue, Mitcham-green, on August 24th, were unanimous in hoping that this game will become an annual event.

It was the first match between the popular Sunday newspaper and the well-known London firm, and the game, always keenly contested, furnished an almost continual series of thrilling incidents, and an exciting finish, time alone saving the *Observer* team from defeat.

A distinguished audience, including Sir T. Vansittart Bowater, Bart., Sir Frederick Bowater, K.B.E., Mr. W. J. McAliece, and Mr. J. M. Blanch, and others, followed the play with interest, and during the tea interval Mr. J. M. Blanch, on behalf of the *Observer*, extended a hearty welcome to Messrs. W. V. Bowater to the Mitcham ground, and Sir T. Vansittart Bowater suitably replied.

It is to be regretted that this enjoyable struggle for supremacy was not favoured with real cricket weather. The teams and their friends, making the journey to the ground by motor omnibus, passed through a heavy rain storm, and after Bowater's had won the toss and the *Observer* team had taken the field, the players were driven to shelter before a ball could be bowled. Later a shower of hail, accompanied by a fierce wind, caused a further scamper for the pavilion, and even when a picturesque rainbow appeared, there was a sharp shower of rain. These interruptions probably saved the *Observer*, as when time was called they were 43 runs behind and had only two wickets to fall.

Up to the fall of the fifth wicket in each innings there was little between the teams. The visitors had only scored 35 when their fifth wicket was captured, and the *Observer* had five men out for 46. While Messrs. W. V. Bowater's side steadily recovered after the loss of their fifth wicket, the *Observer* gradually lost control of the game, and in the end it was only the steady batting of Ornstein and Barrington Ward that enabled the home team to draw a capital struggle.

The visitors, in spite of Howard's nicely played 22 out of the first 27 scored, began badly, for Captain N. Bowater was run out through slipping on the greasy turf, and it was not until Mison joined his captain, Mr. R. V. Bowater, that the bowling was faced confidently. Both had early escapes, but they added 58 for the sixth wicket, and this stand, with the 21 made for the last wicket, enabled Messrs. Bowater's to declare their innings closed with a total of 127 for 10 wickets, twelve a side being played. Mison's 15 was a valuable effort, but the feature of the visitors' play was the stylish 63 not out by R. V. Bowater, in which he hit 7 fours, the batting and wicket keeping of Howard, and the slow left-hand bowling of Smith that secured him four wickets for seven runs.

Against the deliveries of Logan and R. V. Bowater, before Smith relieved the former, the *Observer* batsman did not shape confidently. Long, who had not previously played for two months owing to an injured leg, was beaten by a good ball from Logan, who also had Mann l.b.w. after he had hit 19. Then Jones and Powell, who compiled a steady 18, offered a firm resistance to the attack, and with Ornstein scoring a valuable 12 not out, and taking part in a prolonged stand with Barrington Ward for the ninth wicket, the *Observer* just succeeded in drawing a real sporting game. With nearly ten minutes left for play Ornstein was bowled out, but the umpire had called "no ball."

The full scores were as follows:

St. Cuthbert's Paper Works.

Mr. T. D. M. Burnside, the managing director of the St. Cuthbert's Paper Works, Ltd., on the occasion of the recent annual show and sports meeting of the employees, entertained a number of the children from the Royal Caledonian Schools (for orphans). Their Highland dances, with the pipes, formed an attractive item of the programme.

Mr. W. Harrison, the new chairman of the company, expressed his interest in the social welfare of the employees.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion **3/0**
Three Insertions **6/0**

For every line exceeding three lines **1/.**

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion **1/6**

"BOLDEFIGGER" CALENDARS

(REGISTERED).

To Printers and Stationers.

I am again advertising "Boldefigger" Calendars very extensively this season, and you will probably have many enquiries for them from your customers.

Be prepared to show them samples and give quotations. Full particulars and specimens will be sent on receipt of a post card. Ask for "List A."

GEO. W. LOCKWOOD,
Publisher of the famous "Boldefigger" Calendars,
8, City Road, Manchester.

French Paper Imports.

During the first five months of 1923 the imports of paper for printing into France represented 53,468 m. tons, valued at 61,340,000 frs.; cellulose pulp, 119,709 m. tons, 96,401,000 frs. Importation of these products has been increasing since 1921.

Waterproof Building Paper.

Within the last few years the use of waterproof building paper has greatly increased. A fact which has always been recognised by architects now seems to be much more generally recognised by builders, that a few shillings expended for good waterproof building paper actually keeps out drafts and dampness, reduces fuel bills and has a tendency to preserve the life of the whole structure of the building.

BETTER a man who fails in his efforts than one who never tries.

Linotype Operator's Insurance.

Ministry of Labour Case.

A curious case came up at West Ham Police Court on Monday, when William John Ramsey and Benjamin Thomas Beeckey, trading as the Plaistow Press, at Plaistow-road, West Ham, were summoned for failing to pay a contribution under the Unemployment Insurance Acts.

Mr. L. E. Buncher, who appeared for the Ministry of Labour, said the defendants claimed that a linotype operator employed by them and earning more than £250 a year was not amenable to the provisions of the Act. The Ministry claimed that contributions in respect of this man since the commencement of the Act—about three years—were payable. Since the proceedings were instituted the defendants had sent a letter to the Ministry saying that as they said only £2 13s. 10d. was claimed in the summons they would pay that amount. The Ministry, however, pointed out that they could only take action in the police-court to recover twelve months' arrears of contributions, which amounted to £2 13s. 10d., but they could recover the balance from the commencement of the Act as a debt owing to the Crown, and they declared that £8 5s. 6d. was due. The defendants then sent a cheque for £8 15s. 6d. —the £8 5s. 6d. for the contributions and 10s. as costs.

The Ministry of Labour, however, directed that the cheque be sent back, and it was.

Mr. F. A. S. Stern, for the defendants, said there was no dispute now with the Department, but the defendants felt that they had not been fairly treated.

Mr. Joseph Sharpe (the magistrate) said it seemed to him there was a genuine mistake, and that the Ministry ought to have accepted the cheque. He would advise them to do so now, as he was not going to give them costs.

Mr. Buncher: Having brought the matter before the Court, and in view of your suggestion, we will accept the £8 5s. 6d.

Mr. Sharpe then made an order for the payment of the arrears of contributions and 10s. costs, and the cheque for £8 15s. 6d. sent back by the Ministry was handed in by Mr. Stern.

Why Paper Orders are Lost.

A French View of Exchange Speculation.

It is probably impossible to estimate the damage which is done by the fluctuations and the uncertainty of the exchanges. Some idea, however, is given in the following letter from a French paper house:—

"Following upon our last order, we have had an inquiry submitted to us for 4,000 reams. To our sincere regret, we have been obliged to decline it owing to the high rate of exchange.

"It is very regrettable that, as a consequence of financial manoeuvres which are not at all justified by our situation, purchasing in England should have become quite impossible. We certainly suffer from it, but how much more you must suffer yourselves. These fluctuations in the exchange are only caused by speculators, whose sole object is to make money, and who do not care about the difficulties thus placed on your export trade, and which explains clearly the unemployment from which you suffer so much. This is patriotism in the wrong direction.

"Hard work and not a high sterling currency will feed the people; and if the rise in the rate of exchange for English money continues, you will be unable to sell in the countries with a depreciated currency, and the situation of your works will grow worse.

"It is neither in your power nor in ours to alter the position of affairs; all we can do is to deplore the action of selfish profiteers who look after their own interest first and after those of your country next.

"We hope you will excuse us for telling you bluntly what we, and certainly the whole of the French people, think in the matter."

RAGS and waste to be used as papermaking raw materials were imported into Germany during the three months ended March to the extent of 63,812,000 kilos. as compared with 27,167,000 kilos. in the corresponding period last year.

Papermaking in China.

Description of a Hand-made Process.

An interesting review of papermaking in China now and in ancient days was given recently before a meeting of paper men at Watertown, N.Y., by Mr. Perry D. Taylor, who for 15 years has been engaged installing paper machinery in the Far Eastern Republic.

That the business of papermaking should attract the Chinese is not only most natural, but there is a growing demand for paper to meet the needs of the modern education the Chinese students are bringing to China from many foreign countries. The Chinese were the inventors of making paper from artificial pulp. They made paper from pulp as early as the beginning of the Christian era. Besides inventing the article the Chinese excelled in the quality of the paper they produced. India proof engravings, which were so highly esteemed in the days when hand engravings flourished were obtained by pasting a piece of India paper on the face of the home-made printing surface. This particular variety of the article could not be produced by the papermakers in India, but it came from Canton, China, in the form of wrapping paper on Chinese silks.

The Japanese learned the art of papermaking from the Chinese but soon excelled them in many qualities, while the West went far ahead of either by the introduction of machinery to take the place of the simple hand appliances. But to this day the hand-made papers are the best, and they are produced by the old Chinese method of now over 2,000 years ago.

Family Concerns.

Owing to the fact that the Chinese seldom form companies for business purposes outside of their immediate families they have to learn of our rule that in union there is strength in the business world as well as in matters of state. To-day there are thousands of family paper mills in China employing only the members of their immediate families. Mr. Taylor lately made a business trip into the interior of Kiangai province, where there are over 300 such mills scattered about the bamboo section of the province.

Bamboo is made into pulp by first crushing the pole—they do not chip or cut—after which alternate layers of crushed bamboo and layers of unslaked pulverised lime are put into a trench in the ground, then the trench is flooded. Any small boy who has watched at a mortar bed can form an idea of the heat and boiling therein. The mass is allowed to stand for three or four weeks before being sorted. At this time the white pulp, the cream pulp and the wrapping paper pulp are placed in separate bins while the uncooked stalks are returned to the next cook.

The beating or reducing of the fibres is accomplished in large mortars carved of solid rock and men with pestles or stones and a wooden handle refine the stock. The natives also use a small kollergang arrangement with water buffalo pulling on the outside to revolve the stones in the rock trench. The pulp is screened through bamboo woven screens by hand.

The Process.

Making sheets of paper is accomplished in the usual moulds on woven bamboo cloth and the sheets always have imprinted markings like dandy roll marks. In making coarser paper the operator dips his hand mould into the vat and scoops up an unmeasured amount, but in nicer qualities the mould is rested on cleats with the bottom of the vat submerged and a dipper is used to dip up a measured amount of milky pulp. The operator then keeps the mould bottom below the water until, by violent shaking, the sheet is well formed. The mould is then lifted out and set on a table and a pad with handle is pressed on the inside of the mould and the sheet sticks to the pad when lifted out. The pad is then pressed on to the pile of wet sheets and as it is lifted the sheet of paper remains on the pile. After an inch or less of sheets is accumulated a cloth is spread on the pile and more sheets placed on top. Later stone weights are put on the piles to remove more of the water.

The sheets are dried and calendered by sticking single sheets on to door-like panels of wood highly polished on one side. After a panel is full it is leaned outdoors facing the sun until dry and the side next to the panel is highly finished.

Very little sizing of paper is done in the native mills, as all the product is consumed in China, where printing on but one side and writing with brush is the custom.

China is greatly handicapped for the want of raw material for the modern paper mills already there, but no doubt crops of raw material will soon be raised to fill the need, or wood will be obtained from Manchuria or Siberia. At present the following raw materials are used in China: Bamboo, rice and wheat straw, lung sea grass, goo tree bark and mulberry twigs saved from the food of the silk worm. The first ground wood mill was started in China last June.

The most valuable paper stock Mr. Taylor ever used consisted of 80 tons of used paper money and new money thrown out of use at the time of the change from Monarchy to Republic.

There are now in China eight paper mills with modern machinery, 13 machines in all.

Finnish Paper and Pulp.

Official Comments on Export Business.

While England sent to Finland paper and articles thereof to the value of £4,464 during the first half of this year, Finnish exports of pulp, pulp boards and paper to the United Kingdom represented £1,114,397.

In a report on the financial and commercial position of Finland, issued by the Finnish Consul-General in London, figures are given of the principal articles of export. In 1922 the quantities of paper and pulp were as follows: Chemical pulp, 183,945 tons; mechanical pulp, 51,516; pulp boards, 24,689; paper of all kinds, 192,141; printing paper, 130,082.

In the first half of the current year, the exports from Finland were: Chemical pulp, 103,111 tons; mechanical pulp, 23,012; pulp boards, 12,325; paper of all kinds, 87,956; printing paper, 62,162.

It is interesting to recall that the value of production of the Finnish paper industry in 1921 was 1,270,900,000 F.M.

Reference to the pulp and paper industry of Finland is made by the Bank of Finland Year Book for 1922. Compiled by the Statistical Department of the Bank, it reviews the financial and economic position of the country very fully, while in a number of tables are set out the various operations of the institution and the official rates of exchange since 1877.

In a detailed survey of the economic situation, it is mentioned that the export duty on paper and wood pulp was reduced slightly during the year. With regard to pulp and paper business, the following observations appear: "Sales of chemical and mechanical pulp were in general satisfactory. Prices declined, indeed, during the spring and summer, but rose again in August, and were as high by the end of the year, or even higher, than at the beginning. For news-print, on the other hand, the price fell in England, for instance, from about £19 10s. c.i.f. early in the year to around £18 at its close. With regard to finer qualities of paper, the price conditions were generally unfavourable.

"In respect of timber and chemical and mechanical pulp, the rise in price abroad, therefore, compensated for the drop in the rates of exchange for foreign currency in this country to some extent. As a set-off, however, production proved less profitable in regard to the most important kind of paper, viz., news-print and finer qualities of paper, both through a fall in prices and the position of the exchanges, and, as a result, competition with foreign countries was rendered more and more difficult in the course of the year. The production of paper is not likely, however, to have decreased during 1922."

CARRON GROVE PAPER CO., LTD.—In reference to the particulars published in our columns concerning this company, with a capital of £100 in £1 shares, it should be pointed out that the object of registration was simply for the protection of the name, and as the business is confined to paper-making such branches as stationers, printers, etc., do not come within the company's operations.

THE *British and Colonial Printer and Stationer* circulates all over the world.

Australia as a Customer.

Importations into the Commonwealth of Printing and Allied Products from the United Kingdom and other Countries.

The following figures—dealing with the imports of seven important classes of goods into Australia during the fiscal year ended June, 1922, the latest year for which complete returns are available—are interesting as indicating to British manufacturers of printing materials, etc., the extent of the Australian market, and also as showing the requirements of printers in the Commonwealth. From the figures given it is easily seen that the United Kingdom and the United States are by far the most important sources of Australia's supply. It is interesting to compare the extent of these exports from the two countries during the twelve months ended June, 1922, with those of the preceding year. Of the total value of the various classes of exports mentioned below sent during 1922—amounting to £1,489,159—£914,068 was contributed by the United Kingdom and £511,668 by the United States. In the previous year the total stood at £1,368,293, of which £963,291 was the share of the United Kingdom and £381,628 that of the United States. A calculation shows that the proportion of the shipments standing to the credit of the United Kingdom during the last available period stood at 61·3 per cent., as compared with 34·3 per cent. for the United States. During the corresponding period of the preceding year the value of the shipments sent by the United Kingdom amounted to 70·4 per cent. as against 21 per cent. from the United States.

Printed Books.

Under the heading of "Printed Books" (including fashion books and plates, music, periodicals and newspapers), the returns show that this important branch of export trade amounted to £911,229 during the fiscal year ending June, 1922, as against £1,032,935 in the preceding twelve months. Regarding the supplies from the principal countries coming under this heading the premier position is occupied by the United Kingdom, whose shipments amounted to £784,794. However, this figure reveals a lapse compared with the £859,391 sent in the previous year. The second place on the list is held by the United States, receipts from that country also showing a drop during the year; *i.e.*, from £150,934 to £99,202. While shipments from France (£3,593 against £2,421), the Netherlands (£2,599 against £1,258) and Germany (£2,086 against £1,294) indicate increases compared with the preceding year's trading, those from Belgium (£2,105 against £2,601) mark a slight falling-off.

Printing Machinery.

"Printing machines and presses, linotype, monotype, mono-line, and other type-composing machinery; machinery used exclusively for and in actual processes of electrotyping and stereotyping; also aluminium rotary graining machines," were of the total value of £508,844 during the fiscal year ended June, 1922, as contrasted with £264,045 in the preceding year. Exports from the United States to the Commonwealth of goods of this class of manufacture made a substantial leap forward as compared with the former period. During the twelve months ended June, 1922, consignments from that country represented a value of no less than £378,093, a figure which is largely in excess of the £192,651 recorded in the corresponding period of the previous year. The position held by the United Kingdom—although not so important as that occupied by the United States—shows evidence of steady progress. For instance, during the year under review the United Kingdom's contribution shows a value of £99,074, as against £70,996 in the year before. The third place on the list of importing countries is taken by Canada, whose supplies significantly rose from only £5 to £28,110 Switzerland also has placed herself in a better position, the receipts from that country representing a value of £2,909 against nil in the previous twelve months.

Printing Ink.

Imports of "printing and stencilling ink" entering the Australian Commonwealth during the last year in which the statistics are available amounted in quantity to 1,434,601 lbs. (of a value of £32,842), as contrasted with 1,440,684 lbs. (£32,125) in the preceding year. From the returns it would appear that the principal countries whose productions of this class of manufacture find most favour in the Commonwealth are the United States and the United Kingdom, with Canadian supplies a long way behind. In spite of the fact that the United States holds the leading position it is interesting to notice that whereas the supplies from that country show a falling off compared with the former period, those from the United Kingdom have appreciated slightly. Shipments of "printing and stencilling ink" from the United States during the current period amounted to 1,146,154 lbs. (£18,778), as compared with 1,319,477 lbs. (£20,969) in the former twelve months, while those from the United Kingdom in the same respective periods represented 280,835 lbs. (£13 722) and 116,606 lbs. (£11,066). Canadian consignments amounted in value to £307 during the twelve months ended June, against only £78 in the corresponding period of the preceding year.

Roller Composition.

Judging from the low figure shown in the returns as representing the value of the imports of roller composition into the Commonwealth, it would appear that the demand for this material is well catered for by the home manufacturer. At all events, it is satisfactory to notice that the United Kingdom is the only oversea country that supplies this commodity to the Australian market. The total value of these exports during the fiscal year ended June, 1922, stood at only £733, against £1,325 in 1921, and in the two periods mentioned the United Kingdom was responsible for all of the supplies coming from overseas.

Miscellaneous Printers' Materials.

"Matrices for stereotyping purposes" imported by the Commonwealth reached a value of £13,573, a figure substantially below the £18,032 recorded in the preceding twelve months. Of the countries sending this particular kind of manufacture to the various Australian States the largest supplier is the United Kingdom, with £7,438, an amount, however, which is slightly below the £7,987 sent in the previous year. Although France is not credited as sending to Australia any of the materials coming under this heading during the year 1920-21, she shipped goods in the year under review to the extent of £2,552. Another country that has made headway is Switzerland, from whence "matrices for stereotyping purposes" were sent to the value of £934 in the year ending June, 1922, as against nil in the preceding year. On the other hand, receipts from the United States under this category show a heavy decline from £10,042 to £2,646.

The total value of "printers' materials—comprising circles, clumps, curves, paring knives, rules and leads," reached a figure of £13,556, as against £8,739 in the corresponding period of the preceding year. Practically the only oversea countries supplying these necessary adjuncts to the work of Australian printers are the United Kingdom and the United States. While shipments from the United Kingdom have dwindled from £6,436 to £5,274, those from the United States have risen from £2,303 to £8,184.

"Printers' type—including spaces and quads, linotype and other slugs, metal furniture, and quotations"—represented a value of £8,382, as against £11,092 in the previous year. Here again the consignments from the United Kingdom indicate a falling-off in favour of the United States. During the year under review exports of this character from the United Kingdom to the Commonwealth reached a value of £3,035, as compared with £6,090 during the year before. On the other hand, shipments from the United States have slightly advanced, having risen from £4,729 to £4,865.

PLANS for the erection of a Newfoundland Pavilion in the British Empire Exhibition to cost £12,000, are to be proceeded with.

Salesmanship and Character.

An Ideal Code for Those Handling Paper.

The Salesmen's Association of the Paper Industry, pursuing its policy of developing an ideal code of salesmanship in the industry, has just distributed to its members an artistic folder, containing the creed of the Association, and a condensed definition of a real salesman. The folder is intended for distribution by paper salesmen to their clients, so that an appreciation of the spirit of the Association may be developed among the purchasers of paper, as well as among those who represent the sales department of the mill.

The creed, written by Mr. H. H. Reynolds, a former president of the Association, is as follows:—

We Believe

"That a salesman should be well enough informed to *advise* when, what, and how much his customer should buy, and honest enough not to oversell him.

"That he should be square enough never to betray a customer's confidence—or the mills'.

"That clean living and clear thinking go together and are equally necessary.

"That a salesman should like men; for 'liking begets liking,' and friendliness makes friends.

"That a salesman should believe in himself, his goods, and the business; for the buyer's confidence is the reflection of the salesman's faith.

"In short, we believe that salesmanship is fundamentally—*Character*."

The second portion of the folder, defining a salesman reads:

The Real Salesman.

"One who has a steady eye, a steady nerve, a steady tongue and steady habits.

"One who understands men, and who can make himself understood by men.

"One who turns up with a smile, and who still smiles if he is turned down.

"One who strives to out-think the buyer rather than to out-talk him.

"One who is silent when he has nothing to say, and also when the buyer has something to say.

"One who takes a firm interest in his firm's interests.

"One who keeps his word, his temper and his friends.

"One who wins respect by being respectable and respectful.

"One who is loved by his fellow-men."

European Paper Companies.

Results of Last Year's Working.

The earnings of paper companies in Europe have a particular interest in these times, indicating as they do that profits can be made in spite of political unrest and exchange vagaries. Following are some of the results:

FRANCE.

Papeteries Schwindenhammer (Turckheim, Alsace), profits 255,435 francs, against 155,025; Etablissements Nerson Ainé, nett profits 251,447 francs, dividend 8 per cent.; Papeteries de France (capital 45,000,000 francs); profits 3,824,853 francs; Papeteries du Rhône, profits 30,447 francs, no dividend proposed.

GERMANY.

Dresden United Straw Pulp Mills, dividend 300 per cent.; The Henckel von Donnersmarck (Frantschach Paper Mill), profits 32,000,000 marks, dividend 400 per cent.; Stettin Paper and Board Mills, dividend 500 per cent.; Kostheim Cellulose and Paper (burnt down last year and rebuilt), dividend 200 per cent.; Memel Cellulose and Paper, net profits 116,439,906 marks, dividend 1 dollar.

AUSTRIA.

Nettingsdorf Co., net profit 446,000,000 crowns, dividend 6,020 crowns of 41 gold hellers per share; Bohmisch-Kamnitzer Paper Mill has had to contend against a rise of the Czech crown, whereas the "Haunomuhle" situated in Austria has increased the production of paper 40 per cent. and paid a dividend of 5 per cent.

British Exports of Printers' Supplies.

Statistics Relating to the Requirements of Overseas Markets in the First Half of the Year give Indications of Increased Sales.

In the following article are dealt with many of the principal goods that come within the scope of the requirements of the Colonial printer. The figures relate to the supplies sent abroad during the first six months of the year, and also record the comparative amount of trade done in the corresponding six months of the two preceding years. Even a cursory glimpse at the returns gives evidence of increased demands being made by British possessions for goods manufactured in the Mother Country. The value of the figures is also enhanced by the fact that they indicate to what extent the United Kingdom is capable of satisfying the requirements of overseas markets.

Printing Paper.

Of the different classes of goods figuring in the paper and cardboard export returns the leading place is again occupied by printing paper, not coated. The following figures for the three respective six-monthly periods show to what extent British printing papers have grown in popularity:—

January–June,	1923	1,363,604 cwts.	£1,945,615
„	1922	506,965 „	986,687
„	1921	400,905 „	1,676,800

Regarding the markets to which printings were dispatched during the first six months of the year it is interesting to notice that of the total quantity 1,126,422 cwts. went to British Possessions and 237,182 to foreign markets.

Australia was again the largest buyer of this class of British manufacture, her consumption representing 764,488 cwts. (£924,539) against 196,069 cwts. (£301,287) last year, and 166,261 cwts. (£624,443) in January to June, 1921.

British India comes next with 118,896 cwts. (£196,835), against 59,035 cwts. (£116,165) in the previous year, and 52,923 cwts. (£229,336) in the corresponding six months of 1921.

New Zealand occupies the third place, her takings amounting to 111,021 cwts. (£154,156) during January to June, 31,041 cwts. (£53,874) last year, and 24,837 cwts. (£102,672) in the six months of 1921.

British South Africa has improved her position, that Colony's requirements in the first six months of the year standing at 72,107 cwts. (£125,851), as contrasted with 27,441 cwts. (£64,391) last year, and 41,068 cwts. (£182,071) during January to June, 1921.

Canada, Ceylon and the Straits Settlements have each increased their demands.

Coated Papers.

In spite of German competition in this branch of paper manufacture, British exports to the Colonies of coated papers—which comprise printed and embossed paper hangings—show a great improvement during the first half of the year. Shipments under that heading during January to June represented 61,092 cwts. (£287,557), as contrasted with 34,860 cwts. (£218,986) in the six months of 1922, and 28,631 cwts. (£236,612) in the corresponding six months of 1921.

Writing Paper.

The statistics relating to the shipments of writing paper remain satisfactory. The quantity and value of these during the first six months of the year and those of the two preceding years were as follows:—

January–June,	1923 ...	120,664 cwts.	£332,573
„	1922 ...	68,207 „	259,236
„	1921 ...	68,187 „	464,951

Australian requirements came first, and amounted to 50,044 cwts. (£122,287), against 25 902 cwts. (£82,937); British India came next with 25,964 cwts. (£72,456), compared with 13,077 cwts. £47,842); followed by New Zealand, 14,336 cwts. (£33,832); British South Africa, 5,787 cwts. (£17,066); Ceylon, 1,710 cwts. (£5,235); and the Straits Settlements, 1,608 cwts. (£5,309).

Tissues.

The export of tissues—like most other varieties of British paper and allied products—were on an ascending scale during the period under review. Shipments of this important class of paper reached 7,149 cwts. (£70,462) in January to June, 5,950 (£62,632) in 1922, and 6,559 cwts. (£103,581) in the six months of 1921.

Packings and Wrappings.

The overseas markets for packings and wrappings have been well maintained, the quantity despatched abroad during the first six months of the year representing the second largest item in the export list of paper and cardboard products. Shipments under the heading of packings and wrappings during January to June—amounting to 272,417 cwts.—exceeded those of the corresponding period of the previous year by 164,253 cwts., and were considerably larger to the extent of 214,449 cwts. than those sent overseas during the first half of the year 1921. The value of the three six-monthly periods were: £220,745, 1923; £133,399, 1922; £192,237, 1921.

Stationery Exports.

Supplies of envelopes, not including boxed stationery, were sent overseas to a large extent during the six months. The actual figures for the three periods were as follows: 21,614 cwts. (£91,039), 1923; 16,476 cwts. (£88,156), 1922; 12,752 cwt. (£143,140), 1921.

Other sorts of stationery dispatched abroad during January to June represented 73,323 cwts. (£614,650), comparing with 58,309 cwts. (£725,970) during the corresponding period last year, and 69 538 cwts. (£1,008,995) in the 1921 period.

Regarding shipments to Colonial markets of stationery goods other than paper, the biggest buyer was British India, her purchases during January to June representing a value of £101,433. Australia was the next on the list with £81,413, followed by New Zealand £27,936, Canada £21,568, Straits Settlements £18,165, and Ceylon £10,137.

Boards.

British boards—which comprise millboard, strawboard and cardboard—during the first six months of the year were in good demand by oversea markets, the quantity dispatched abroad during the period representing not only an advance compared with the corresponding six months last year, but an improvement contrasted with January to June, 1921. The actual figures for the three six monthly periods were: 53,291 cwts. (£103,569), 1923; 33,639 cwts. (£80,764), 1922; 50,825 cwts. (£167,660), 1921. The recently increased demand for this important branch of British manufacture is all the more noteworthy on account of the great strides being made by European countries to gain a better footing for their products in Colonial markets.

Printed Books.

Export business in printed books during the first six months of the year was on an extended scale. Whilst large consignments of this important branch of British export were shipped to many of our leading Colonial markets, the demands made by Australia were well maintained. As a matter of fact, the Commonwealth holds the position as the biggest buyer of printed books which this country has to offer. During the six months under review shipments coming under this heading reached a total of 151,713 cwts. (£1,513,564), a figure which represents increases compared with the 116,481 cwts. (£1,381,722) dispatched abroad during the corresponding period last year, and 143 554 cwts. (£1,742,020) contrasted with the 1921 period.

Printing Type.

Exports of British printing type were not on a large scale, and record a very slight advance compared with the corresponding figure for last year. In this branch of manufacture of course the United States has a strong pull on oversea markets, and the competition home manufacturers have to meet from that source is of considerable importance. Nevertheless with the reputation gained in the past by British manufacturers of this indispensable adjunct to the printers' craft, there is no reason why a better demand should not be forthcoming. These figures show that printing type sent abroad during the first six months of the year stood at 99 tons (£33[illegible] against 98 tons (£31,047) in the preceding year (six months), and 182 tons (£[illegible] during January to June, 1921.

Boxes and Cartons.

The many uses to which the cardboard box and carton have been put during recent years have made this industry an ever-increasing one. The carton to-day occupies an indispensable place in the wrapping of foodstuffs and the thousand and one different articles of domestic necessity. Apart from the actual use of the carton itself it is satisfactory to know that British manufacturers realise the importance of this branch of industry, and are placing on the market machinery capable of turning out very rapid and efficient work. During the first six months of the year boxes and cartons of paper and cardboard (including folding boxes) were sent overseas to the extent of 15,819 cwts. (£69,961), as compared with [illegible] cwts. (£46,340) in the corresponding period of the preceding year, and 9,976 cwts. (£5[illegible] during January to June, 1921.

Paper Bags.

Improved machinery for the manufacture of a great many different varieties of paper bags has been coming on to the market during recent years, with the result that British makers of these productions are able to keep abreast of their competitors in supplying the needs of Colonial and other markets. During the first three months of the year the small volume of paper bags exported was rather unsatisfactory, but during the course of the six months' trading there was a considerable improvement. The returns show that during January to June paper bags dispatched abroad reached 15[illegible] cwts. (£41,818), as contrasted with 9,285 cwts. (£33,380) in the previous year, and 8,695 cwts. (£49,207) in the corresponding period of 192[illegible]

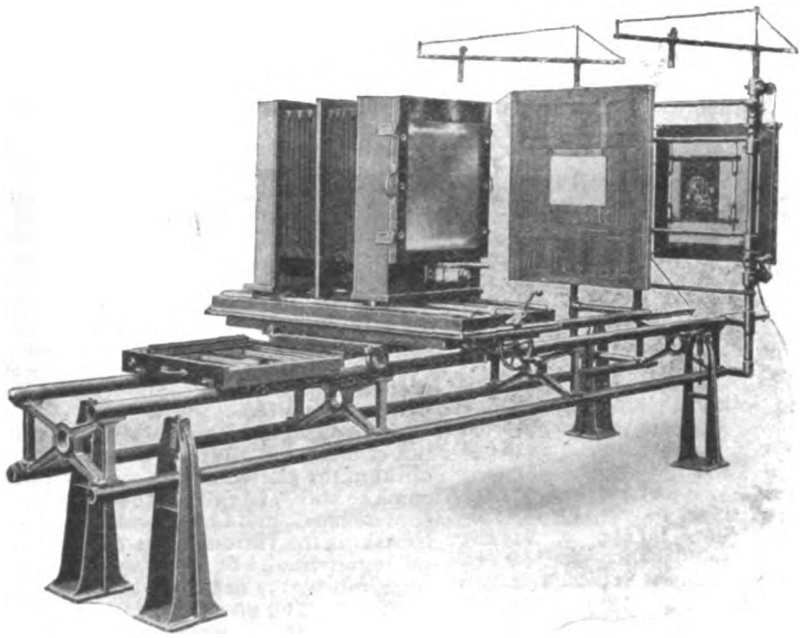
Playing Cards.

Very little improvement has taken place in the export of playing cards during recent months. This is rather surprising in view of the fact that many British firms have shown commendable enterprise in pushing this class of manufacture. During the first half of the year shipments of playing cards represented 1,037 cwts. (£19,185), against 1,037 cwts. (£21,155) in the corresponding period of the preceding year, and 556 cwts. (£13 494 in January to June, 1921.

Canada & British Empire Exhibition.

The Canadian Pulp and Paper Association will co-operate with the Federal Government at Ottawa in exhibiting productions of the industry at the British Empire Exhibition which is to be held in London in 1924. All the Canadian paper companies are being invited to send samples which will be suitable for export trade. There will also be a varied display in the Federal exhibit of the commercial woods of the Dominion, some in the rough and others in the finished state.

Canadian Pulp and Paper Exports.



The total value of the exports from Canada during the twelve months ended June 30th of wood and its products, including paper, was $246,562,641, as against $189,305,091 in 1921-22. Shipments include the following:—

	Cwts.	Dolls.
Paper, total exports ..		[illegible]
Paper, news-print ...	21,058,793	[illegible]
Wood pulp, chemical ..	11,022,166	[illegible]
„ mechanical	6,626,451	[illegible]
Lumber, total exports	—	[illegible]
Lumber, planks and boards	2,342,988*	[illegible]
Pulp wood	1,281,298†	[illegible]

* M feet. † coords.

Australian Notes.

Government Printer Appointed—Gordon and Gotch Report—Turnover Doubled—Edwards Dunlop Profit—Selling Price of Paper—News-print from United Kingdom—Banned Paper and Books—New Companies.

(From Our Sydney Correspondent.)

THE new Government Printer has been appointed in the person of Mr. A. J. Kent. Other appointments announced in connection with the State Printing Office are Mr. F. Walsh, secretary and accountant; Mr. D. H. Paisley, special assistant; and Mr. E. C. O'Sullivan, manager No. 1 branch of the Printing Office.

AT the half-yearly meeting of Gordon and Gotch, Ltd., held in Melbourne, the chairman, Mr. G. F. Matthews, said that since the inception of the company the turnover had nearly doubled. To provide more capital he expressed a hope that the directors would see their way clear, at an early date, to offer to shareholders the balance of the ordinary shares at par. In reply to a shareholder's suggestion that the matter should be allowed to stand for twelve months, the chairman said that of the issued capital of £422,000, over 50 per cent. represented fixed securities and £200,000 liquid assets. This latter amount he considered insufficient as it was unfair to the company's bankers to ask for large advances on so small a sum.

IN the year ended April 30th Messrs. Edwards, Dunlop and Co., Ltd., earned net profit of £61,353, comparing with £61,338 in the preceding twelve months, the total for appropriation being £38,430, as against £77,826.

DIVIDENDS have been paid quarterly on ordinary shares, the rate remaining at 10 per cent. per annum, of which only the final quarter's payment has yet to be made. The preference dividend is distributed half-yearly, and is at the rate of 5 per cent. per annum. Other allocations recommended by the board comprise £15,000 to the reserve fund, which will then be in credit £155,000, and £1,600 to the bonus and provident fund. The balance to be carried forward is £17,082.

AN interesting note appears in the report concerning the position of the paper market. During the year, it is intimated, the selling price of paper from stock in Australia dropped considerably, the fall, as a whole, being greater than was justified by costs at the mills. Those costs were now slightly higher than when stock was taken on April 30th last. It is mentioned that a considerable proportion of Australian requirements for news-print is now coming from Great Britain, and "this is likely to continue so long as the Commonwealth Government maintains its present tariff preference to paper manufactured in the United Kingdom." The company is stated to be getting its full share of business, and its turnover has been well maintained.

CONSIDERABLE time has been devoted in the Legislative Chamber at Melbourne to the question of banned books and papers. Among the works which are not allowed to enter the country are those dealing with political questions of an extreme order. A number of papers emanating from various countries and being of the more frivolous order are also included in the order.

AMONG the new companies registered are the following:—

J. C. Clarke Publicity Co. (Aust.), Ltd.—Capital 20,000 shares of £1 each; to establish, acquire, print, publish and circulate newspapers, books, pamphlets, etc., and to carry on the business of general printers.

Everyones, Ltd.—Nominal capital £20,000, in £1 shares; to acquire and take over the business of Everyones, Ltd., printers, publishers and newspaper proprietors.

Photo-Engraving Art Co., Ltd.—Authorised capital is £10,000 in 10,000 shares of £1 each; process and photographic engravers, printers, die-sinkers, artists, draughtsmen, publishers, etc.

Australian Paper Trade.

Import and Export Figures.

The values of paper and paper goods imported into and exported from the Commonwealth during the periods mentioned were as follows:—

Imports.

May	1922	1923
Cardboard and other paper boards	£11,618	£19,786
Printings	132,197	199,315
Wrappings of all colours	24,458	37,048
Writing & typewriting paper	36,162	71,221
All other paper	61,164	38,966
Directories, etc.	66,541	81,797
All other stationery	52,483	112,093
Totals	£384,623	£560,226

July to May	1921-22	1922-23
Cardboard and other paper boards	£132,351	£230,390
Printings	1,816,164	2,146,658
Wrappings of all colours	261,400	382,831
Writing & typewriting paper	313,935	614,889
All other paper	580,409	411,082
Directories, etc.	833,823	1,024,326
All other stationery	493,390	1,033,276
Totals	£4,431,472	£5,843,452

Exports.

May	1922	1923
Paper	£4,515	£3,592
Stationery	15,633	15,226
Totals	20,148	18,818

July to May	1921-22	1922-23
Paper	£45,273	£47,375
Stationery	178,871	172,369
Totals	£224,144	£219,744

New Paper Mill in India.

We understand that Mr. Kashi Ram, managing director of the Newal Kishore Press, Ltd., Lahore, has obtained concessions from the Punjab (India) Government to utilise Bhabbar (Baib) grass grown in the Kelsar Forest of the Government. He has also obtained long leases of similar grass grown in the forests of two Indian native states bordering on the Government forest, with permission to investigate on these leased areas other grasses suitable for papermaking.

The paper mill will be situated 14 miles from the grass area, and will be run entirely by electricity generated from a fall of 41 feet derived from the rapids of the Jumna river near the head works of the Western Jumna Canal, which is navigable right down to Delhi. It is suggested that the proposed paper mill will be more favourably situated than any other now existing in India, being so near the raw material, having all the power it requires at its door, without importing any coal from Calcutta, a distance of 1,200 miles, while the mill is six hours' journey from Delhi by water and 200 miles by rail from Lahore, both big centres of the paper trade in Upper India. There is plenty of coolie labour in the vicinity for 6d. to 8d. a day.

A limited liability company with a capital of five million rupees, or over £300,000, has been floated to work out these concessions.

Quotations are now being sent out from this country for hydro-electric plant and the paper mill machinery, and the promoters hope to make paper early in 1925.

It is proposed to erect a mill of 20 tons daily capacity, producing a superior kind of white printing, laid, bond and ledgers There is more than the required quantity of grass available, while there are adequate supplies of timber in the forests of the Province for making pulp. For the time being, however, the mill will confine its activities only to grass, as under the present transport arrangements the wood is too expensive to be taken out from the forests.

Empire Forestry Conference.

Pulp Wood Resources Discussed in Canada.

The second British Empire Forestry Conference which was held in Canada took place at a critical period in the history of forestry, especially of the pulp wood aspect of the subject. The whole question was very fully reviewed both in relation to Empire resources and the influence which timber denudation in other countries exerts upon supplies.

At the initial meetings in Ottawa questions relating to the Empire trade in forest products, re-afforestation, Canada's future supply of pulp wood, sylviculture, and many other matters of importance connected with forestry, were discussed. Delegates from every country in the British Empire were in attendance, and reports were presented dealing with forestry problems in each. Following the meetings in Ottawa the delegates toured the Western provinces, the concluding sessions of the conference being conducted at Victoria, British Columbia.

Major-General Lord Lovat, in delivering the chairman's address, stated that in his opinion the conference as an institution had come to stay. In calling together the present conference Canada had made a wise decision by asking the various parts of the Empire to be represented, not only by the growers of trees, but by the users of timber. The importance of linking up the growers' interest and the consumers' interest could not be too strongly stressed. All discussions on timber production which were not based ultimately on timber realisation and utilisation were founded upon dangerous ground.

Soft Woods in Europe.

During a discussion on the world's soft wood supply, Ptofessor Storey, of the British Forestry Commission, said that although definite information of the present situation in Europe was practically unattainable owing to the chaotic post-war conditions in Continental Europe, it was estimated that even prior to the war the total consumption of soft wood in Europe exceeded the annual growth by 3,000,000 cubic feet per annum. Professor Storey presented a tabular statement of the situation which demonstrated that two countries in Europe only, Sweden and Finland, were in a sound position with respect to their timber supplies. In all countries annual depletion far exceeded annual growth.

Dr. C. D. Howe, Dean of the Faculty of Forestry, of the University of Toronto, in a paper on sylviculture conditions in Canada, exposed the past indiscriminate exploitation of the great natural resources of that country where no concern had been taken for the future. Forestry to the average citizen meant tree planting. That this was so was largely the fault of those well able to advise differently. The truth was that while planted forests were necessary in certain of the older settled parts of the country, Canada's future timber supply could never be otained in that way.

During a discussion on Empire trade in forest products Sir James Calder, C.B.E., one of the British delegates, said that in future Russia would be the biggest single factor in European soft wood supply, as there were tremendous areas of valuable coniferous forests in that country still unexploited.

Outlook in the United States.

At the concluding session of the conference in Ottawa, Colonel Henry Solon Graves delivered a paper on the soft wood resources of the United States. He stated that although three-quarters of the original soft wood forests of the United States had been cut over, it had been estimated that that country still contained more soft wood timber than any other country except Russia. The United States contained, he said, 225 million acres bearing pure soft wood forests, in which soft wood predominated. In addition, the country had 70 million acres of denuded lands which formerly bore soft woods, but are now largely unproductive, and 12 million acres of the south-east coast of Alaska also bear virgin soft wood forests. Colonel Graves estimated that, in all, the country contained 1,830 billion board feet of timber suitable for the manufacture of lumber, and 940 million cords of pulp wood. In conclusion, Colonel Graves pointed out that, superficially, the country still has enormous resources.

My Name is - NODIS

I am THE Typecaster, always at your service, to cast Sorts, Borders, Ornaments or complete fonts at a saving of 75% on Founders' Prices.

I help you to attain 100% EFFICIENCY by increasing your production 33⅓%, eliminating Distribution, and saving your floor space.

I am simple in construction and simple to operate. Write for full details to:—

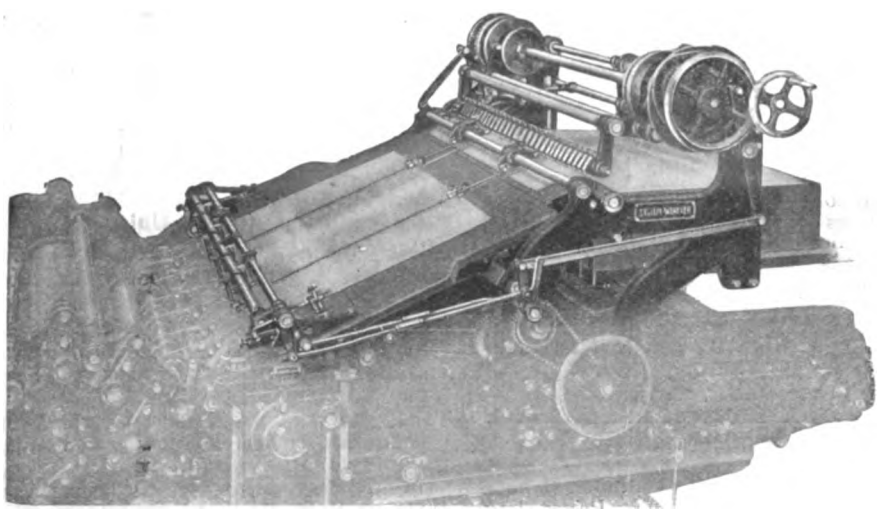
EXTENSIVE MATRIX-HIRE - - LIBRARY AVAILABLE FOR "NODIS" AND "DAVIS" USERS.

MODELS from £50

WILLIAMS ENGINEERING CO., Ltd.,

NODIS WORKS,

Julien Road, NORTHFIELDS, Ealing, W.5.



'Phone: EALING 1864.

NODIS BORDER 129 A.B&C.

The "WINKLER" Automatic Feeder

will increase the productive capacity of your Printing Machine, 25 to 50 per cent. above that of hand feeding, with better register. When feeding large sheets of very thin paper the output percentage is even higher.

SWISS MANUFACTURE.

SEPARATION of sheets by suction and blast.

Length of printing machine is not increased and access not impaired.

Feeds to register any stock from tissue to board.

Works in unison with the machine, and at any speed up to the maximum guaranteed by the press makers.

Rapid change of jobs, and therefore suitable for short runs.

No tapes or friction wheels, and therefore no marring of colours or setting-off when working colours or backing up.

The blast of air frees the sheet from dust and fluff before it is fed.

Adaptable to any type and size of sheet fed press; if desired, with a Stacking Arrangement.

Write to-day for Prospectus to the Sole Agents—

A Buyers' Guide to Supply Houses

Advertising in the "British and Colonial Printer and Stationer," with a brief reference to some of their Specialities.

BOOKBINDERS AND BINDERS' SUPPLIES.

AUG. BREHMER (T. McAuliffe, British Successor), 12, City-road, E.C.1. Bookbinders' machinery.

THOMAS BROWN, 7, Albion-street, Manchester. English gold leaf, brown and white blocking powder.

CASH AND CLARE, 75, Great Eastern-street, London, E.C.2. Bookbinders, box makers, and gold blockers.

CAXTON MACHINERY Co., 188, Albert-street, Glasgow. Wire stitching machines.

DOW AND LESTER, Forester's Hall-place, Clerkenwell-road, London, E.C.1. Bookbinders to the trade.

FISHER BOOKBINDING CO. (1912), LTD., St. Ann's Works, Herne-hill, London, S.E.24. Binders to the printing trade.

GARWOOD AND MUDDIMAN, LTD., 77, Queen Victoria-street, London, E.C. Leather and leatherette, grains.

NICKERSON BROS., 99 and 101, Worship-street, London, E.C. Tanners and manufacturers of moroccos, roans, etc.

T. W. AND C. B. SHERIDAN CO., LTD., 63, Hatton-garden, E.C.1. Gathering, binding and wrapping machines, Sheridan case-makers, paper cutters, blocking and embossing presses.

SMYTH-HORNE, LTD., 1-3, Baldwin's-place, Baldwin's-gardens, Gray's Inn-road, London, E.C.1. All bookbinding machines.

G. WELLS AND CO., 11, Bread-street-hill, London, E.C.4. Loose leaf specialities.

T. WILLIAMSON AND CO., 6, 8 and 8a, Palace-square, and 7, Pool-street, Manchester, and 30-31, St. Swithin's-lane, London, E.C. Cloths, label cloths, photograph cloths.

WINTERBOTTOM BOOK CLOTH CO., 60, Wilson-street, London, E.C. Manufacturers of bookbinders' cloth, label cloth, morocco cloth, buckram, etc.

COMPOSING AND TYPESETTING MACHINES.

VAN HUIDEN, Winschoten, Holland. Strawboards, corrugated boards, mill and leather boards, etc.

SPICERS EXPORT, LTD., 19, New Bridge-street, E.C.4. Papermakers and Manufacturers.

HARRY B. WOOD, 201-5, Produce Exchange, Manchester. Boards, dextrine, leather, wood pulp and straw.

PAPER AND PRINTING TRADE PUBLICATIONS.

"BRITISH AND COLONIAL PRINTER AND STATIONER." Publishers: Stonhill and Gillis, 58, Shoe-lane, London, E.C.4.

Founded in 1878, this weekly journal is the recognised medium for Printers, Stationers, Box Makers, Envelope Makers, Bookbinders, etc. Its pages contain the latest improvements in machinery, descriptions of new processes, and commercial intelligence and current news. Subscribers get the paper for 52 weeks for 13s. "THE BOOKBINDER" forms a Monthly Section of the *British and Colonial Printer and Stationer*, and subscriptions are are booked for these issues at the rate of of 3s. 3d. per annum, including postage. A Monthly Section is also devoted to the interests of Lithography.

"WORLD'S PAPER TRADE REVIEW." Publishers: Stonhill and Gillis, 58, Shoe-lane London, E.C.4.

This weekly journal, established in 1879, gives particulars of Papermaking Machinery and Processes, Current Prices of Raw Materials, Market Reports, Interviews with Leading Men associated with the industry, Commercial Intelligence, etc. Annual subscription: 32s. 6d. (subscription 26s., plus postage 6s. 6d.).

PLANT AND MACHINERY.

BUMSTED AND CHANDLER, Cannock Chase Foundry, Hednesford, Staffs. Paper bag making machinery.

EDMUND BUSH AND SON, LTD., Crown Point-road, Leeds. Hot-air drying apparatus for drying varnished and gummed sheets.

CAXTON MACHINERY CO., 74, York-street. Glasgow. C.M.C. "Perfection" Machine, Wire stitching, platen presses, etc.

FRANCIS J. CONNOLLY, LTD., Union Works, 62, Park-street, Southwark, S.E.1. Voirin perfecting offset machines.

PLANT AND MACHINERY.

R. W. CRABTREE AND SONS, LTD., Water-lane, Leeds. Offset machinery.

A. EDLER, 78, Southwark-street, London, S.E.1. Typograph composing machines, cutting machines, etc.

J. AND S. EYRES LTD., 2 Miles Platting, Manchester. Flat bed offset machines.

OSCAR FRIEDHEIM, LTD., 7, Water-lane, Ludgate, London, E.C.4. Cables, "Friedheim, London." Machinery for the bookbinding, printing and allied trades.

JOHN HADDON AND CO., Salisbury-square, Fleet-street, London, E.C.4. Printing machinery, type and sundries for the printer.

HARRILD AND SONS, LTD., Fleet Works, Norwich-street, E.C.4. Printers' Roller Manufacturers.

HUNTERS, LTD., 16-18, St. Bride-street, London, E.C.4. Golding jobbers, folding machines.

LANSTON MONOTYPE CORPORATION, LTD., 43, and 43a, Fetter-lane, London, E.C.4. The Miller automatic feeder.

WM. J. LIGHT AND CO., LTD. (incorporating Robt. Bateson and Co.), 36-8, Whitefriars-street, E.C.4. Stereo machines, rotary machines for all purposes, offset machines, flat-bed machines, platen machines, etc.; also dry flongs for all classes of stereotyping and "Everwear" oil and inkproof press rubbers.

LINOTYPE AND MACHINERY LIMITED, 9, Kingsway, London, W.C.2. The Miehle, Centurette, offset, two-colour offset, and litho offset rotary. L. and M. automatic metal furnace.

GEORGE MANN AND CO., LTD., Henry-street, Gray's-inn-road, W.C. Rotary offset machines, flat-bed, bronzing, litho machinery.

MARINONI, VOIRIN, REUNIS, 96, Rue d'Assas, Paris (VI.), France. Rotary presses, stereotyping machines, offset presses, lithographic machines, etc.

JOHN T. MARSHALL, 36, Powell-street, Goswell-road, London, E.C.1. Supplies duplicate parts of well-known bookbinding machinery.

EDWARD L. MEGILL, 60, Duane-street, New York. Platen machine gauges.

MIEHLE PRINTING PRESS AND MANUFACTURING CO., LTD., Blackfriars-house, New-bridge-street, London, E.C.4. The American Miehle Company's vertical Miehle press.

The American Miehle Company's Perfecting and Two-colour double-cylinder two-revolution Presses. The American Miehle Company's Four, Three, Two-roller and "Pony" single-cylinder two-revolution Presses, each type being constructed in various sizes. The American Miehle Company's Vertical Job Press complete with automatic feeding and delivery mechanism and necessary electrical equipment. Extension Deliveries for the Two-Revolution Machines.

PICTORIAL MACHINERY, LTD., 7, Farringdon-road, London, E.C.1. Telegrams: "Pictograph, London." Lithotex process and plant. Plates for printing.

T. H. PULLAN AND SONS, 31, Falfield-street (Eglinton-street), Glasgow. Printing machinery of all kinds for export.

SALMONS' AUTOMATIC PATENTS, LTD., 1, Gough-square, Fleet-street, London, E.C.4. K and B flat bed presses, two-revolution, single-sided presses.

JOHN SHAW AND SONS, Honley, near Huddersfield. Striker pen ruling machines, new "Imperial" and "Super-Imperial" disc ruling machines and new "Imperial" rotary perforating machines.

The Bridge Hall Mills, Bury, are worthily maintaining the standard of James Wrigley and Son, Ltd., a name that stands high in the ranks of British papermakers. Not only is this so, but samples to hand from Mill 219 how that some of the older makes have been distinctly improved, while new and higher class papers have been introduced. It is pleasing to note this spirit of enterprise in an old business. The new tub-sized papers and E.S. writings are of excellent quality, and the range covers ledger, esparto, banks and bonds, and a variety of laids and woves. Stocks are held at the mill, so that regularity and quality and prompt execution of orders are assured.

The "J. Green and Son" hand-made ledger papers, in samples distributed, bear the statement: "This paper was made by hand at Hayle Mill, Maidstone, by craftsmen whose grandfathers followed the same craft with the same firm—J. Barcham Green and Son."

Paper Exchanges.

Some Details of an Interesting Scheme.

From time to time suggestions have been made for setting up a paper exchange. Little advance has been made in this country so far, but in the United States a scheme appears to be taking definite shape. Exchanges are to be established in New York and Chicago.

It is stated that plans for the establishment of an exchange for dealing in paper and allied products are going forward rapidly, and board, wire, felt and waxed paper divisions of the industry are all ready to begin trading.

It is proposed to include all of the various branches of the industry in the new project. The tissue men have already shown great interest in the proposition. Several book paper manufacturers have also inquired about the exchange and expressed approval of the plan. One or two news-print concerns have also been approached, but their attitude is not known at the present time.

Will Revolutionise Paper Market.

It is claimed that the exchange will alter the whole aspect of the paper market. Futures would be bought and sold just as they are on the cotton exchange. This, of course, would tend to make paper a speculative commodity but it is pointed out that it would have a stabilising effect in spite of this.

Particularly in the waste paper field the exchange is expected to have a good influence. Much of the buying in waste paper is of the hand to mouth variety simply because the board mills are not sure of the packing.

Method of Fixing Prices.

Mr. Gair, who is interested in the scheme, has explained the methods of classification and selling. In each field of the industry some one thing would be picked on which to make a basic price. The other articles would be either cheaper or more expensive. Supposing, for instance, news-print in rolls were used as a basis in this branch of the market.

Specifications as to the weight, quality and other points would be drawn up and agreed upon. Then, if the price were 3.80 to 4.00 cents a pound a differential would be fixed for the other grades of "news," using this as a basis. A half a cent a pound might be added for the price of sheets and a half a cent subtracted for the price of side runs. Thus the fundamental relationship between the three would always remain the same and the prices of all three would be based upon roll "news." Sheets would always be half a cent higher a pound and side runs half a cent lower.

Trading in some of the more unusual grades of paper, where absolute standardisation might be difficult, could be done by sample.

The plan is to have the quotations chalked up on a board as fast as they change and then get out a small daily newspaper giving prices for the day's trading.

The whole thing has resulted from the decision of the Supreme Court of the United States that the Armstrong Bureau, with which a large group of board manufacturers were identified, was operating in violation of the Sherman Law. Mr. Gair said that the decision of the court clearly pointed out that any organisation composed exclusively of sellers banded together for their own benefit was illegal. The exchange, Mr. Gair thinks, will tend to stabilise the market, by making trading and prices a matter of public information and at the same time the buyers will be admitted to it making it no more illegal than the Stock Exchange or any of a hundred or so similar institutions now in operation in various parts of the country.

The man who goes through life hunting for a soft thing can find it right under his hat.

Paper Trade Statistics.

Overseas Countries' Imports and Exports of Paper.

The quarterly return dealing with the figures up to June 15th, 1923, issued by the Board of Trade, gives the following interesting statistics relating to the imports and exports of paper of certain foreign countries and British Possessions:—

FINLAND.—In the four months ended April news-print was exported from Finland to the extent of 41,700 tonnes (of the value of 131,447,000 marks), as against 41,815 (159,921,000 marks) in the corresponding period of the previous year, and 24,333 (113,357,000 marks) during January to April, 1921. Packing paper exports in the three respective periods were: 9,045 tonnes (33,707,000 marks), 9,609 (44,098000), 3,570 (16,996,000). Pasteboard figures were: 8,621 (21,971,000), 5,976 (17,326,000), 2,102 (6,976,000). Writing paper: 2,081 (11,898,000), 5,124 (29,443,000), 810 (7,990,000). Tissue paper: 399 (4,451,000), 72 (2,373,000), 302 (2,864,000).

NORWAY.—Printing paper exports during the three months ended March represented 40,796 tonnes, compared with 30,504 in the corresponding period of last year and 19,664 during January to March, 1921. Packing paper sent from Norway amounted to 16,874 tonnes in the quarter ended March, as against 14,530 in the corresponding period last year and 2,162 during January to March of the preceding year.

SWEDEN.—Paper "of all kinds" exported from Sweden during the four months ended April reached 75,505 tonnes, as contrasted with 54,226 during the corresponding four months last year and 36,593 in the 192: period.

DENMARK.—The value of the imports into Denmark of paper and paper manufactures during the four months ended April was 8,502,000 kr., as compared with 7,047,000 kr. in the similar period last year and 8,555,000 kr. during January to April, 1921.

GERMANY.—Given in 100 kilos., fancy, coloured, varnished, etc., paper was exported from Germany during the first three months of the year to the extent of 43,652, as compared with 30,213 in January to March last year. Photographic paper exports stood at 3,385 for the three months ended March, as against 2,934 in a similar period of 1922.

NETHERLANDS.—In tonnes, the imports of printing and writing paper (including news-print) during the four months ended April amounted to 11,556 (of the value of 2,797,000 guldens), as against 11,044 (2,448,000 guldens) in the previous year and 9,560 (4,802,000 guldens) in the first four months of 1921. Exports of the same class of merchandise during the same four-monthly periods were: 15,369 (3,880,000 guldens), 1923; 10,437 (2,761,000 guldens), 1922; 7,649 (3,955,000 guldens), 1921. Strawboard exports reached 64,417 tonnes (6,752,000 guldens) during the first four months of the year, 44,964 (3,527,000 guldens) last year and 27,301 (4,608,000 guldens) in the corresponding period of the preceding year.

BELGIUM.—The imports of paper and cardboard into Belgium (including Belgo-Luxembourg) for the four months ended April amounted to 13,550 tonnes (of the value of 25,637,000 francs). Exports of the same class of material for the same period stood at 12,152 tonnes (27,961,000 francs).

FRANCE.—Given in 100 kilos., the imports of paper into France during the three months ended March stood at 313,942 (of the value of 40,104,000 francs) as compared with 254,535 (33,617,000 francs) in the corresponding period of last year and 277,273 (74,230,000 francs) during January to March, 1921. Paper exported in the same three-monthly periods were: 117,120 (83,941,000 francs), 1923; 84,708 (59,396,000 francs), 1922; 86,841 (60,922,000 francs), 1921.

SWITZERLAND.—Printing paper, etc., exported from Switzerland during the three months ended March, in 100 kilos., stood at 27,619 (of the value of 1,471,000 francs), as against 36,270 (2,144,000 francs) for the three months of the previous year and 10,811 (1,239,000 francs) in January to March, 1921.

SPAIN.—Paper for cigarettes exported during the whole of last year amounted to 2,256 tonnes (of the value of 8,313,000 pesetas), as compared with 3,248 (11,758,000 pesetas) in 1921, 3,357 (7,217,000 pesetas) in the 12 months of 1920. Exports of the same class of goods during January stood at 275 tonnes (995,000 pesetas), as contrasted with 186 (672,000 pesetas) in the corresponding month last year. [Peseta = 9.6d., or 25 to the £.]

ITALY.—Paper (white or dyed in the pulp), exported from Italy, in 100 kilos., during the whole of last year, amounted to 31,571, as against 37,591 in the preceding year, and 56,011 in 1920. The value of these exports last year stood at 33,521,000 lire, and 36,817,000 lire in 1920. The figure for 1921 is not available. [Lira = 9·6d., or 25 to £.]

CZECHO-SLOVAKIA.—The exports of packing paper, in 100 kilos., from Czecho-Slovakia during the three months ended March amounted to 30,468, as contrasted with 29,437 in the corresponding period of last year, and 26,803 during January to March, 1921. The following represent the quantity of the other classes of paper leaving Czecho-Slovakia during the first three months of the year, the figures in parenthesis showing the amounts in the corresponding period of the previous year: Packing paper, 23,454 (50,706); cardboard, 12,664 (6,521); writing paper, 3,492 (3,044); cigarette paper, 800 (2,143).

GREECE.—Printing paper imported into Greece in the eleven months ended November, 1922, stood at 5,187 tonnes (of the value of 14,956,000 drachmas), in the corresponding period of 1921, and 4,221 (7,067,000 drachmas) during the eleven months ended November, 1920. The imports of writing paper represented 588 tonnes (2,652,000 drachmas) in the same eleven months last year, 871 (2,970,000 drachmas) in 1921 and 1,080 (2,483,000 drachmas) in 1920. [Drachma = 9·6d., or 25 to £.]

EGYPT.—Imports of paper and other classes of paper goods imported into Egypt (in kilos.) in the three months ended March were as follows, the figures in parenthesis representing the amounts for the corresponding period of the preceeding year: Wrapping paper, 3,011,411 (2,595,913); cardboard, 2,259,664 (1,094,148); printings, 1,928,704 (1,463,003); writings and envelopes, 326,484 (378,121); cigarette paper, 176,472 (89,725). The three months' imports of printings reached a value of £E42,000 in the present year, and £E31,000 in the corresponding period last year. Cigarette paper exports reached 6 tonnes in the three months ended March, as against 10 tonnes last year and 27 tonnes in the corresponding period of 1921. [£ Egyptian = £1 0s 6¼d.]

BRAZIL.—Paper and paper manufactures entering Brazil during the twelve months last stood at 43,923 tonnes (of the value of 51,704,000 milreis), as against 29,267 (59,178,000 milreis) in the previous year, and 47,817 (75,375,000 milreis) in 1920 (twelve months). [Average value of paper milreis = in 1920, 14⅜d.; 1921, 8¼d.; 1922, 7d.

JAPAN.—Printing paper imports into Japan during the whole of 1922 (in piculs) reached 480,810 (8,772,000 yen), as contrasted with 157,014 (4,418,000 yen) in the preceding year, and 159,352 (5,811,000 yen) in 1920. Packing paper imported amounted to 268,213 (4,385,000 yen) last year, 142,468 (3,864,000 yen) in 1921, and 168,942 (5,386,000 yen) in 1920. The value in 1922 (twelve months) of the exports of paper and paper manufactures stood at 22,310,000 yen, as compared with 25,573,000 yen in 1921, and 34,367,000 yen in 1920. [Picul = 133½ lbs. avoir. Yen = 2s. 0½d.].

SIAM.—Imports of unprinted paper during the three months ended March amounted to 599 tonnes (of the value of 217,000 ticals), as against 427 (193,000 ticals) in the corresponding period of 1922, and 488 (456,000 ticals) in 1921. [Tical in 1921, 2s. 2d.; 1922, 2s. 1¼d.; 1923, 1s. 10d.].

BRITISH INDIA.—The value of paper imports during the twelve months ended March was 2,62,52,000 rupees, as contrasted with 2,05,22,000 rupees in the corresponding period of the preceding year, and 6,84,07,000 rupees in 1921.

CEYLON.—Imports of printing and writing paper during the month of January reached 2,401 cwts. (of the value of 84,000 rupees), as compared with 2,516 cwts. (1,16,000 rupees) in the corresponding month of 1922. Other paper imports in January reached a value of 1,13,000 rupees, as against 1,64,000 rupees in the corresponding month last year, and 40,000 rupees of the first month of the year 1921.

NEW ZEALAND.—Printing paper imported into New Zealand during the first two months of the year amounted to 72,011 cwts. (£88,000), as compared with 54,691 cwts. (£66,000) in 1922, and 37,103 cwts (£126,000) in the corresponding period of 1921. "Other" paper imported was of the value of £95,000 in January-February of the present year, £54,000 last year, and £206,000 during the two months of 1921.

BRITISH SOUTH AFRICA.—Printing paper imported into British South Africa during January-February reached 45,768 cwts. (of the value of £64,000), compared with 30,544 cwts (£55,000) in the previous year, and 78,885 cwts. (£315,000) in the two months of 1920. Wrapping paper imports were 17,467 cwts. (£21,000) in January-February, 12,117 cwts. (£23,000) in the two months last year, and 30,010 cwts. (£112,000) in the first two months of 1921.

Paper Prospects in Assam.

Data Relating to Native Grasses.

In a recent issue of the *Paper Industry* Mr. E. H. S. Barter, late of Assam, India, has an article of some interest upon the possibilities of development of the pulp industry in Assam. During recent years extensive experiments have been carried out under the supervision of the Indian Government.

In Assam at the present time there are tens of thousands of acres of Savannah grasses which have been tested and proved to be admirably suitable for certain classes of pulping. Two qualities of paper have been manufactured; one a paper similar to Serampore from Sabai grass and an excellent Badami bazaar or packing paper for which there is considerable demand throughout India. These papers are manufactured from grasses which are known as Khagra and Batta.

Mr. Barter contends that paper pulp prepared in Assam for Indian use is cheaper than the imported material, and a ready market exists for it. This would free the amount now imported into India for use in Europe and America. In his opinion, the world-wide demand for good paper pulp is likely to reduce the amount available for export to India, and therefore that country's resources should be developed. In the Assam grasses is found a pulp which will bleach easily and cheaply. There are grasses other than those mentioned which will produce very excellent brown paper and cardboards in abundant quantities.

Dealing with the question of cost, the writer states that before the war Calcutta paid for the best quality pulp, for white papers, about £7 per ton c.i.f., and during the war the price rose to £53 per ton. The price is not expected to again drop to the pre-war figure, but to remain steady at about £20 per ton. In the opinion of manufacturers consulted by Mr. Barter, any concern producing easily bleaching pulp at this price would be embarking upon a good proposition.

Mr. Barter states that of the 75,000 tons of paper annually consumed in India, only 30,000 tons are manufactured in that country; the remaining 45,000 tons being imported.

As to the grass-bearing districts in Assam, Mr. Barter visited several districts—one at Barpeta, of over 20,000 acres, another at Borjania, of 10,000 acres, and a third at Harri Chur, of 1,000 acres. These areas were chosen as being near to a steamer-calling station. The land nearer the rivers bears a larger proportion of Khagra grass, whilst the higher mainly carries Batta. An advantage with these grasses is that they can be cut and repeat themselves every three years. It was learned that the Government would readily grant cutting rights.

In regard to output, Mr. Barter says:—"The output of dry grass per acre is: Batta 3.5 tons every year and Khagra 7.8 tons every third year. When the grass is first cut it is wet and naturally weighs more, the amount from each acre being: Batta 6.7 tons, and Khagra 19 tons. Experiments have shown that daily ten men could cut and bundle the grass on one acre of Batta land, and forty men could do the same to one acre of Khagra land, the day consisting of eight hours labour.

"The yield of pulp from the dry grass is 38 per cent. in the case of Batta and 43 per cent. in the case of Khagra, one acre of Batta producing roughly 1.33 ton of pulp annually, and Khagra 3.35 tons. It will, therefore, be seen that, as Khagra land is predominant, it will take approximately 752 acres of Batta land to produce 1,000 tons of pulp, and 2,683 acres of Khagra to produce 9,000 tons, to aggregate the 10,000 tons annually which are necessary to make a successful pulping mill.

"The initial capital expenditure has been estimated to be very high, but a first-class plant should be erected for about half a million dollars, capable of turning out at least 20,000 tons annually. To anyone who has the best interests of the pulp and paper trade at heart and who has sufficient vision, there are prospects in Assam beyond the dreams of avarice."

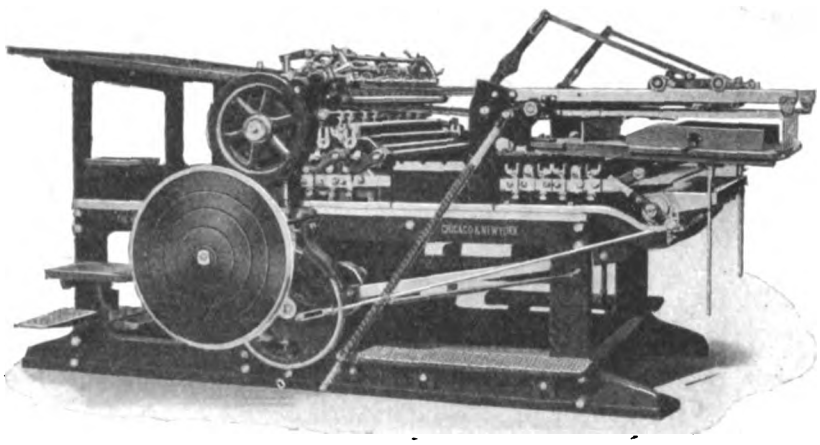
The . . .



American Miehle Company's THREE-ROLLER Two-Revolution Press.

SPECIFICATION.

Type matter locked in Chase, 24 in. × 38 in.

Largest sheet which can be delivered, 26½ in. × 41½ in. (approximately Double Royal).

The Inking arrangements on this machine are adequate for all requirements. The Three-roller Press has a pyramid of eight rollers and riders over the forme, three of the rollers being inkers.

Gear side view of the American Miehle Company's Three-roller Two-Revolution Press.

Over-all measurements:
Width 7 ft. 10 in.
Length with sheet delivery 12 ft. 3 in.
Practicable speed per hour 2,400.

✖ ✖

THE American Miehle Company's Three-roller Two-revolution Press will handle satisfactorily every class of work undertaken by the Jobbing Printer. It will print the heaviest and lightest formes with equal ease. It registers to a hair and delivers faultlessly. It is an American Miehle Company's Press, in no way inferior to that Company's regular Four-roller machine, bearing the same high reputation, and giving the fullest satisfaction where installed.

This machine may be seen running by appointment.

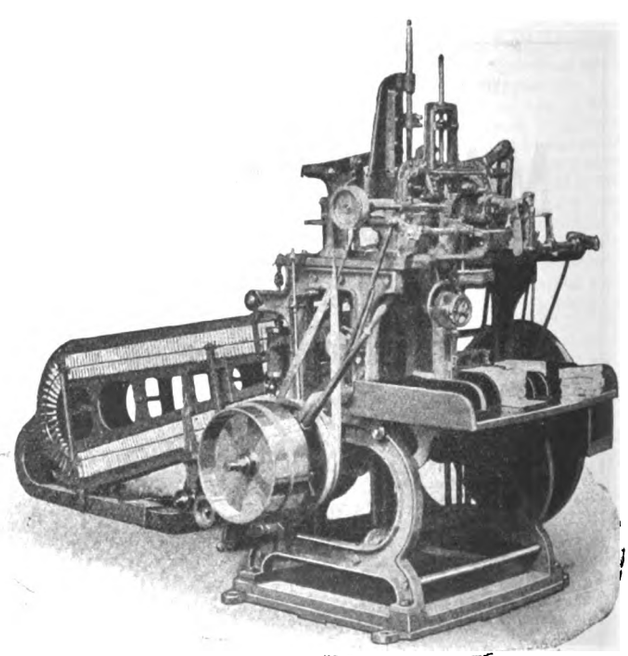
The American Numerex Cleaning Outfit

has been specially placed on the market to reduce to a minimum the trouble of the proper care of numbering machines.

Care of Machines: If numbering machines are properly taken care of, they should stand up, even under the extreme conditions they are subject to, for many millions of impressions. The first matter to consider, therefore, is the cleaning away from the frame and working parts the printer's ink, dirt and other foreign particles that hinder the proper functioning of these devices.

Full Particulars from the Sole European Agents:

Price of Complete Outfit £1. 8. 6



The Outfit Includes:

2 1-Piece Steel Trays
1 Wire Drip Tray
1 1-Gallon Can of Numerex Cleaning Mixture
1 Wooden Handle Cleaning Brush
1 Bottle of Numerex Numbering Machine Oil
1 Oil Can

Gold Inks

(LETTERPRESS)

IF you have never yet tried Gold (Letterpress) Inks or are familiar only with those hitherto obtainable, Lorilleux and Bolton's gold inks will be a revelation to you.

No modern printer keen on cutting costs and speeding up production can possibly afford to ignore the handiness and economy they offer.

The following points show the great superiority of Lorilleux & Bolton's gold inks:—

1. They do not clog or harden on the rollers.
2. Need no specially skilled operator.
3. Are suitable for either platen or cylinder machines.
4. The machines can be run at normal speed.
5. Retain their brilliance for long periods.
6. Print the type thoroughly and heavy solids without difficulty.

Available in light and dark shades of gold as well as silver.

Write for specimen prints and generous sample tin to-day.

Wire Stitching Machines for every purpose.

Thread Stitching and Knotting Machines for School Exercise Books and Calendar Work.

Thread Book Sewing Machines for Sewing Light Letterpress & Heavy Account Books.

Glueing Machines, End Sheet Pasting Machines and Folding Machines (Hand or Automatic Feed).

THIS Machine is intended for sewing the heaviest Account Books, Letter Copying Books, Guard Books, etc., and is made in two sizes, one to take books up to 22 in., and the other up to 28 in. in length. According to size, one to six books may be sewn at one time and cut asunder afterwards, each separate book having kettle stitches at its ends and also between the tapes. Speed of Machine, according to size of work, is up to 35 Sections per minute.

No. 33 Thread Book Sewing Machine.

THE TRIUMPH OF Modern Offset Lithography

By JOSEPH GOODMAN, F.R.P.S.,

City and Guilds of London Honours Silver and Bronze Medallist, Lithography and Photo-Mechanical Processes. Author of "Practical Modern Metalithography," etc.

Very few letterpress printers have a full and satisfactory idea of the exact scope and capacity of offset lithography, or how that it compensates for the drawbacks and deficiencies of the older direct form of printing. The advantages which this method affords the lithographer are so manifold and comprehensive that it is difficult to select any one feature as the starting point of its merits.

Unique and Important Feature.

There is, however, one feature of its capacity that stands out quite unique above all other printing processes, whether relief, intaglio, or direct lithography, and one that is chronologically correct and important. That is the power and capacity of offset lithography to print perfectly upon the hardest surfaced materials, such as tin plates, thin iron sheets, brass and copper plates, celluloid, xylonite, or the most resistive surfaces such as ivory, enamels, rough textile fabrics, bright steel enamel flint faced papers, or deeply indented cover papers such as crocodile markings, parchment and grease-proof conditioned papers, fancy surfaces of every description, metal foiled printings, hard bond and linen-faced papers, in fact anything portable and usable in either hand or power driven offset presses.

The responsiveness of the rubber blanket surface is as accomodating as the soft pad of one's finger cushion, and just as quick to resume its correct posture after pressure, no matter how many times it may be pressed, or how varying the surface that it is applied to. In other words, the offset blanket can be made to pick up the thinnest film of printing ink no matter what the colour may be, and impart it again to any of these surfaces without destroying them or becoming itself impaired by the procedure.

The Rubber Blanket and its Qualities.

This remarkable proceeding is best explained by a brief description of the nature and composition of the rubber blanket itself, and the technical conditions which contribute to this power of attainment.

The offset blanket is not a mere film of rubber upon a supporting base, it is a built-up product carefully prepared at each stage of manufacture. The base consists of a substantially woven textile fabric, well stretched and shrunk, and as homogeneous as it can be made. Upon this base is applied the first film of rubber, even and uniform as machinery will provide. Then follows the next layer of textile material, which in turn has the second layer of rubber applied upon it. The next stages are a repetition of the former until the final thick layer of rubber is applied which forms the printing surface, but actually there is a duplication of blanket surfaces so that two printing surfaces are in contact face to face during the manufacture.

The blanket should be micrometrically true and even throughout its main area, and the surface should stand the test of examination by a powerful lens to prove that it is free of pinholes and blisters, etc. The maximum stretch should have been taken out of it by repeated and firm rolling without any undue local nip or drag.

Choice of Blankets.

The question of colour, whether of the red or grey shades, does not materially affect the rubber so far as elasticity or durability is concerned, but the red certainly enables the printer to discern whether it is picking-up the ink in a sufficiently vigorous manner or not, as he can trace any line of black ink impressed upon its surface, and thus ascertain the force of regularity and uniformity infinitely better than when a similar impression is made upon the grey rubber blanket. This affords a better clue to him as to how he can adjust his ink to meet tender paper difficulties. Also he can see how much fluff or fibre is picked up by the ink much more clearly with the red rubber blanket than the grey one.

These rubber blankets are made in either three, four or five ply states, giving of course a differentiated elasticity according to the number of alternating layers of rubber incorporated. The happy medium is the most popular form of rubber blanket which comprises the four ply. These are classified respectively as ·065 for the three ply; ·075 for the four ply, and ·085 for the five ply. Offset machine makers standardise to a definite gauge of blanket.

The Blanket's Wonderful Capabilities.

The fundamental feature of offset printing, then, is centred in this material, the rubber blanket, as practically everything depends upon it for results. To be a perfect medium for offset printing it must be capable of repeating its function for millions of impressions. Some blankets last longer than others, even in the same machine and when used by the same machine-minder. It follows that it must pick up the ink image for each sheet of paper printed, and that it must not present the slightest difference of surface to that image for each sheet printed, or there would be a smudge or doubling of that image which would be fatal to good printing. It must therefore maintain its elasticity, and be free from any creeping tendency over the whole of its surface.

When it is remembered that it has frequently to pick up a half-tone image dot produced by a line screen of 200 to 300 lines to the inch, it will be appreciated that if it can negotiate a perfect picture so made and transfer it to a sheet of rough paper prepared with a surface marking imitating a crocodile hide, and yet impress a perfect image upon that uncongenial surface, so that experts of printing are unable to find a fault with it, one will be willing to concede that the rubber blanket of offset lithography is a truly remarkable material. But what is even a greater source of wonder is that it can do all this without destroying the marking of this crocodile pattern, although parts of the image are lying upon the top of the raised portions of the pattern, whilst just as many other portions are lying in the depths of the depressions and crevices of the pattern.

Judged by the light of the orthodox method of "direct" lithography, this fancy marked paper would have to be flattened with the pressure that would need to be expended and applied if the printed image ever reached the depressions, and then the work would be thickened due to the pressure exerted, and nothing near so sharp and clear, nor as even as what the offset method would assure, notwithstanding that the whole character of the special paper was destroyed.

Great Advantages Accruing.

There are a number of classes of printing paper used in direct lithography which have ever given the printer the greatest trouble to obtain firm and solid printing, such as ledger and bond papers, bright enamel and flint-faced papers, grease-proof and imitation

Digitized by Google

parchments, hand-made laid and antique papers. To negotiate these successfully, the transfer upon the machine stone or plate has to be specially etched into relief, which is a very delicate and risky job, and one which consumes a considerable amount of time and material. In addition to this extra labour and procedure, the machine-minder has also to pack his machine cylinder with pads of blotting paper and other assistive materials. In addition to all this extra manipulation, he has to apply a heavier pressure for the impression. Despite all this, the resultant print cannot be compared with that same job when printed from offset. The rubber blanket yields a perfect impression without any extra effort. The hardest and the roughest papers are negotiated with the same ease and assured perfection. Less ink is consumed, and a sharper and more even image is produced. The ink by virtue of the thinner film required dries very much quicker. Very much less pressure is needed. Comparatively less power is absorbed. Greater durability and longevity of the image is obtained. And, due to the inherent sensitiveness of pressure which characterises the offset principle of printing, a much greater speed can be obtained in printing. In short, "two blades of grass are made to grow, where only one grew before."

Superior Speed of Offset.

Comparing the running speed of the relief surface printing machines such as the Wharfedales, and those of the intaglio ones as represented by the photogravure machines, the lithographic rotary offset is roughly twice as productive in quantity as these two competing methods. This comparison is limited to sheet-fed machines. Reel-fed machines of the relief type as used for newspaper work are not considered in this review, as they are limited to newspaper and periodical production of a standard character. It may not be out of place to remark here that intaglio work is also done from offset in a limited sphere, such as monetary columns, and architectural line work, key plates, etc. Very delicate line columns are printed from zinc plates produced by fine engraving direct upon the plate in conjunction with the planographic image transferred to the same plate, both characters from the same plate.

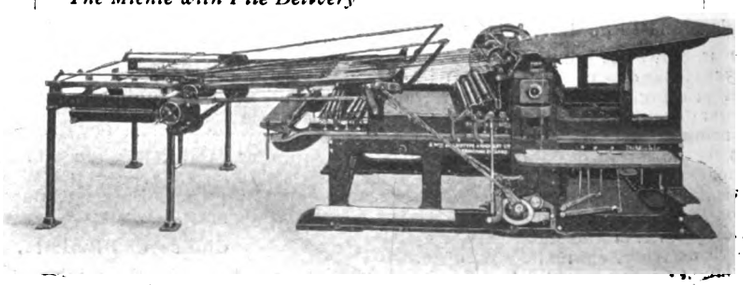
FINE PRINTING

Go into any printing works noted for good quality printing and you will see Miehle presses.

In some of these printing works you will see *only* Miehle presses. Why?

All these printers cannot have made a mistake when equipping their works with Miehles.

Nor would the all-Miehle houses and others who have added to their Miehle installations have repeated their orders if the original orders had proved to be blunders.



The Miehle has received, and continues to receive, the best backing by discerning printers. They will tell you why.

We are the manufacturers of this famous two-revolution press. It is built in six sizes, from double demy to ex. eight crown. May we send you full details?

The Skin Troubles of Lithographers.

Suggestions for their Prevention and Cure, by A. C. Austin.

From rather close observation it would seem that chromic acid poisoning among lithographic workers is quite prevalent; rather more than has been the case for some years past. In fact, it would seem that there are recurrent periods when there are more than the average of poison cases and more complaint, which may be attributed in part to a lack of agreement as to the best etching medium for metal plates and lack of definite knowledge among lithographers concerning the action of all the etches.

I know that for several years the so-called "white etch," which is non-irritant and not actually poisonous unless taken internally, was most popular. Nearly all that used an etch prepared after that formula were loud in its praises, and I have heard it predicted that chromic acid would eventually be forever banished from the shop. Now, strange to relate, many that were enthusiasts for "white etch" are saying that chromic acid is the only etch that works satisfactorily. We are fickle folks because we do not know and are not agreed in practice.

Chromic Acid Poisoning.

The object of this writing, however, is not to discuss the relative merits of any particular combination of chemicals for the so-called etching of lithographic plates, but rather to point out certain preventative measures againt chromic acid poisoning, and poisoning from this source, in my mind, is largely the result of carelessness.

There is no question that chromic acid is an irritant and a virulent poison that should be excluded from all shops; no doubt that it will be when something as good is given to the trade and duly accepted, and it is quite possible that this time may be hastened if we are forced by law to abandon its use, which would seem not far off if we listen to the agitators.

Personally neither chromic acid nor the bi-chromates affect me. Like many others I am immune, but some fellow-workers do suffer the "tortures of the damned," and once the poison gets a firm hold on the system the efforts of physicians to cure the evil seem unavailing. There are no means of knowing whether any fatalities have ever occurred, but it certainly is a calamity to an afflicted one and a most unsightly disease.

I believe that the poisoning can be prevented, even in very susceptible cases, provided the necessary care and proper precautions are observed, and I think it is the duty of every employing lithographer to insist that employees observe this care and precaution and that means be furnished by the employer to this end. The trifling cost of the needed material for prevention and the little effort necessary for enforcement of care would be more than paid for by the comfort of the men. Beside this it is well known that many competent workmen, pressmen, transferrers, etc., have given up the trade and gone into other lines of work because of the effects of chromic acid, and there is no need for losing good men when it can be avoided. The most successful medical practice in the world is directed to prevention rather than to cure. It is far better to save torture than to alleviate it, which applies to chromic acid and the dangers encountered in using it and therefore my preachment.

Prevention of the Trouble.

The first and foremost need in prevention is cleanliness, which many will say is impossible in a print shop, although not at all difficult if cleanliness is really desired. A method to secure this desired end and to guard against the poisoning is as follows:—

Before beginning work every man that is to handle the acid in any form during the day should wash his hands and arms with carbolic soap and carefully dry them afterwards. Paraffin wax should then be applied to the skin and rubbed in thoroughly until the surface is dry, which is but a moment's work. Paraffin wax for this purpose can be prepared by melting the wax over slow heat, adding afterward a small quantity of pure benzole, enough to keep the mixture in a semi-liquid condition. To this also may be added a few drops of carbolic acid. If there are any abrasions or cuts on the hands these should be covered with surgeons' plaster after the waxing.

Several small stoneware jars should be provided in convenient places in which is kept a 10 or 15 per cent. solution of sodium bisulphite in water and the workmen should be instructed to dip the hands in this solution immediately after using the acid in any form. This water solution of bisulphite of soda will not remove the wax, but it will counteract the acid and the wax will be effective the greater part of the day, unless considerable turpentine is used, in which case it may be necessary to re-wax the hands occasionally. In the absence of the bisulphite, common salt may be used in stronger solution or a strong solution of alum will do very well.

When through with the day's work another thorough washing with carbolic soap is advisable, and if the hands are at all dry and inclined to crack some diluted glycerine should be used, or any of the cold creams or lotions offered by the druggists.

In some shops it is the practice to use either a tannic acid, or a nut gall etch for a first treatment, to be followed after rolling up with the chromic acid, or possibly a bichromate etch, and these tanning solutions often cause the skin to dry up and crack. If this is the case a workman should use the glycerine, or the lotions, to soften the skin again, for softened skins will not crack.

If an employer will furnish the means and constantly reiterates the need for cleanliness it is certain there will be very little if any trouble with chromic acid. We are a careless, heedless bunch, however, and I fear this advice will not receive the attention it really deserves.

Curative Treatment.

To those already afflicted, whose arms and hands are covered with virulent sores, there is no outward application that is better than nitrate of mercury ointment, the oldest known remedy. This ointment is not difficult to prepare if one follows the directions as given in the U.S. Pharmacopoeia under the heading "Unguentum Hydrargyri Nitratis":

Mercury	7	grammes.
Nitric acid ...	17.5	,,
Lard (water free)	76	,,

To make about 100 grammes.

Heat the lard until melted and then add slowly seven grammes of the nitric acid, stirring with a glass rod and being careful that the lard does not spatter on the hands or face. Immediately after this froths up shut off the heat and cool the mixture. Dissolve the mercury in the balance of the nitric acid, warming if necessary, and stir it into the lard. This ointment is of a bright lemon colour, and for that reason is sometimes called citrine ointment. The mixing should be done in porcelain dishes only.

The ointment should be applied liberally on going to bed and bandages should be wrapped around the hands and arms to prevent soiling the bedclothes. If necessary it can be applied at any time during the day, in smaller quantities, if the hands and arms are clean. A temporary relief from severe itching may be obtained by applying with a piece of cotton the following solution:—

Glycerine	4	drams.
Carbolic acid	1	dram.
Alcohol	5	ounces

It is a long and tedious thing to heal the skin when the poison is well established, but there is no known means for cure other than outward application and cleanly habits. It is a pity that we must use chromic acid, or bi-chromate salts, although the latter, while obtained from the chromate base, is not so virulent as the first, but custom and perhaps necessity demands that we use both, therefore it behoves us also to use care that we may not suffer in the end.

If some good fellow will come along with a perfectly satisfactory non-poisonous etching solution and freely give the formula to the trade at large he will be doing a great service to his fellow men.—*National Lithographer*, New York.

Lithographic Trade Review.

NOTES AND NEWS.

THERE is an increasing spirit of cheerfulness abroad in the lithographic section of the trade, and business continues to show a healthy liveliness. Despite seasonal slackness, the number of members of the Amalgamated Society of Lithographic Printers signing the out-of-work book to-day is about 30 per cent. less than was the case this time last year.

IT is gratifying to learn that a settlement satisfactory to both sides has at last been reached in the trouble affecting lithographers employed by a Bristol firm. Following pacific efforts by the Conciliation Committee of the Federation of Master Printers, by the joint secretaries of the Joint Industrial Council, and latterly by Mr. A. E. Holmes individually, a meeting was arranged between the men concerned and the general secretary of their union, with the result that points of difference have happily been smoothed out.

THE latest developments in photo-litho and offset printing are of such great importance to the whole printing trade that the lack, felt by many printers, of an adequate literature of the subject has been a serious handicap to progress. We are all the more glad, therefore, to hear that preparations are well in hand for the publication of a reliable text book of photo-litho and offset printing, containing chapters by some of the most prominent practical specialists and technical authorities, who will deal with the processes, means and methods employed from beginning to end in this important branch of the printing craft.

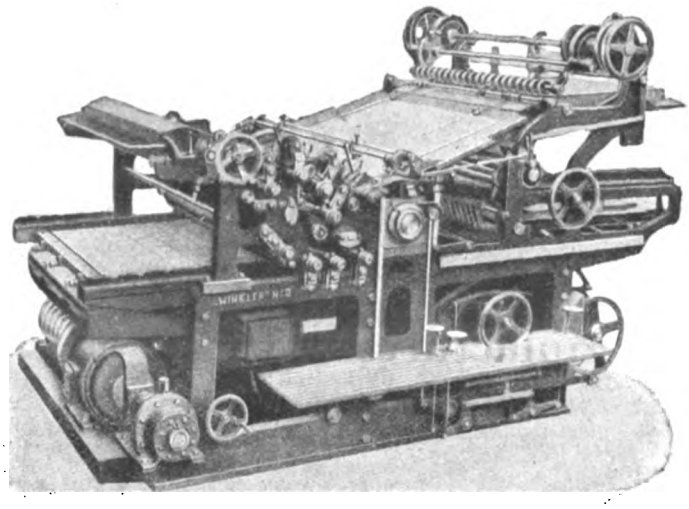
THE book is edited by Mr. F. T. Corkett, F.R.P.S., who writes on "Security Printing by Offset-Lithography" and "Facsimile," whilst other contributors and their subjects are: Mr. A. B. Evans, "Offset Troubles and Remedies"; Mr. S. E. Bottomley, F.R.P.S., "Offset Notes"; Professor Goetz, Leipzig State School of Printing, "Offset Printing"; Mr. William Gamble, F.R.P.S., F.O.S., "High Light Negatives for Offset Work"; Mr. J. R. Riddell, "Offset Printers"; Mr. B. H. Pocock, "Offset Transferring and the Rotary Machines" and "The Remarkable Advance of Process Litho Photography"; Mr. C. M. Coates, "Suitable Inks for Offset"; Mr. Edwin C. Potter, "Remarks on Plates and Blankets"; Mr. Edgar S. Hanes, F.I.C., F.C.S., "Offset Inks"; Mr. J. M. Dodds, "Offset *versus* Direct Lithographic Printing"; Mr. Frank Heywood, "The Evolution of Offset Machinery"; Mr. Herbert J. Crowder, "Practical Hints in Photo-Litho Practice"; Mr. A. H. De La Rue, "Practice in Offset Printing"; Mr. Ernest E. Garrett, "Graining and Transferring Consideration"; Mr. Felix Choice, "Printing-Down and Pitfalls to Avoid"; Mr. S. Peabody, "Features of Offset Inks"; and Mr. J. H. Benton, "The Making of the Correct Negatives for Offset Lithography and Process Work Generally."

THE negotiations which have been going on for a long time between the Amalgamated Society of Lithographic Printers and the Amalgamated Society of Lithographic Artists have now borne satisfactory fruit. Though actual amalgamation between the two bodies may be considered as the ultimate aim of those identified with the welfare of the respective organisations, the recent discussions have as yet only been directed with a view to bringing about a common working agreement. A committee has been established which will represent the two societies. The first meeting of this newly-formed committee is to be held to-day (Thursday). We understand that one of the principal objects of the committee—apart from matters concerning the internal organisation of the two associations—is the question of closely watching the progress being made in photo-litho developments.

THE meeting of the International Triennial Congress of Lithographers has been abandoned this year owing to internal troubles in Germany. The Congress, which was founded about 20 years ago, and of which the late Mr. G. D. Kelley was first general secretary, was to have been held in Luxenbourg.

THE quarterly meeting of the National Council of the Amalgamated Society of Lithographers will be held on Saturday at Manchester. The agenda is of a comprehensive character, and will deal with many important questions concerning the trade. Delegates are expected from all parts of the British Isles.

THE Lithographers' Auxiliary to the Printers' Pension Corporation will commence its operations for the coming season early next month. A little anxiety has been felt recently that the rank and file of the trade do not support the activities of the auxiliary as well as they might, and an improvement in this respect is looked forward to in the coming days. A good start has been made in the selection of Mr. Andrew Spottiswoode as president for the ensuing year.



WHEN Continental printers buy apparatus from this country to the displacing of well-known German goods, and when they follow on with repeat orders for the same supplies, the inference is that we have here a thing that is in the forefront of progress in its particular line. Such, we believe, is the case with the Douthitt Diaphragm Control, that remarkable device for standardising the density of negatives in repetitive photographic work which Messrs. Pictorial Machinery, Ltd., have introduced to the British market. Certain it is that the line of progress in photo-litho lies in the direction of making delicate photographic processes as far as possible automatic and foolproof, and constant advance is to be expected in cheaper and better production attained by such means.

AT a recent convention held by the Amalgamated Lithographers of America, the growing importance of lithography in advertising was one of the main points made plain. Emphasis was laid on the popularity of bright colours, and the need that lithographers should do all in their power to meet the public demand for increased brilliance in lithographic printing.

LIVE in deeds—not years.—BAILEY.

The "WINKLER" High Speed Automatic Art Press.

With Oscillating Cylinder and Printed-Side-Up Delivery Without Sticks.

Discriminating printers recognise it to be the ideal machine for producing Fine Half-Tone and Multi-Colour Work.

Unequalled for Dead Register, Rolling Power, Impressional Strength, Speed. Absence of Gear Marks and Noiseless Running.

Occupies only about half the floor space of a two-revolution machine for the same size of sheet.

The middle inking roller is of smaller diameter, thus eliminating any possibility of circumference marks on solid surfaces.

The forme is supplied with **fresh** ink from **all** inking rollers both during the forward and backward space movement of the bed.

To prevent "picking" when printing difficult work on art paper **electric heating** of the bed is provided, the inking rollers being specially **water-cooled.**

Automatic Cylinder Check, Throw-off of inking rollers and Slow Motion.

SWISS MANUFACTURE.

INSPECTION INVITED.

SOLE AGENTS—

WILLIAM J. LIGHT & CO., Ltd.,

New Offset Rotary Perfector.

Reel-fed Machine for Newspapers and Periodicals.

A fact which should be of much interest to British printers is that on the Continent a number of single-colour and two-colour periodicals and illustrated papers have during recent years been successfully produced by the offset process on reel-fed rotary perfecting machines at a speed equalling that of an art rotary letterpress machine.

The development of offset printing is intimately bound up with the development of photo-process methods and there is no doubt that more rapid progress in the application of the photo-offset process has only been hindered by the lack of positive and accurate methods and appliances for producing the images on the machine plate and above all by the scarcity of photographers who combine mastery in all the technics of photography as half-tone, line and screen work with a fundamental knowledge of the technic and the art of reproduction work. Although there is ample evidence of a definite trend in the direction of the increased use of photo-litho-offset processes, there is no doubt that we have only just crossed the threshold of their almost unlimited possibilities and adaptability.

The Latest Thing in Offset Presses.

The new web offset machine, which we illustrate herewith, incorporates many exclusive features and is the result of the experience and initiative of leading experts. It is of extremely strong construction throughout and very conveniently accessible, though requiring little floor space. The perfecting printing mechanisms are built according to the three-cylinder principle and permit of easy access and control. All the cylinders are equipped with ring-lubricating bearings of latest construction, and all geared parts of the machine are provided with dust-proof bearings with automatic lubrication.

The inking mechanisms are constructed according to the latest experience and are characterised by a very thorough distribution. The ink feed can be minutely regulated according to requirements by turning a handle. All the rollers may be thrown off at any moment by an ingenious device, either by hand or automatically, and at the same time the ink feed from the ink duct is also stopped.

The damping devices are situated underneath the plate cylinder and are thus easily accessible and avoid the possibility of water being sprinkled on the blanket or impression cylinder. The damping rollers are adapted to be finely adjusted to obtain the required pressure against the plate cylinder, by means of which the degree of damping may be regulated within wide limits.

The water feed may also be minutely regulated by eccentrics and the duct roller of the water duct may at any moment be thrown off by means of a hand-wheel, thus eliminating the necessity of dangerous hand-wiping.

The tapeless folding apparatus, running entirely in ball bearings with automatic lubrication, can be arranged according to individual requirements.

The capacity of the one-reel machine is about 7,000 cylinder revolutions per hour, which corresponds to 7,000 single-colour copies of 16 pages, or 14,000 copies of four and eight pages, cut and folded. This output may be increased according to the quality of the plates and the paper.

Considering that runs of 50,000 off one set of plates are nothing exceptional, it is obvious that here we have to do with a machine that is likely to play a leading part during the impending period of greatly increased use of photo-litho-offset processes. We venture to say that the introduction of this machine is of paramount importance and there is every likelihood of its being an immediate extraordinary success.

These machines are supplied through the well-known firm of Messrs. William J. Light and Co., Ltd., 36–38, Whitefriars-street, Fleet-street, London, E.C.4. We are informed that the first of these rotary web perfecting offset machines in this country has just been erected in the works of the Elm Press, Ltd., 14A, Elm-street, Gray's-inn road, London, W.C.

PAPER FOR NEW ZEALAND.—The office of His Majesty's Trade Commissioner in New Zealand has forwarded particulars and samples for the supply of cream laid foolscap, single sheets ruled, and pass book envelopes required by the Post and Telegraph Department, Wellington, New Zealand. Tenders must reach the Stores Manager by 4 p.m. on October 2;th, 1923. Copy of the tender form and samples may be seen on application to the Department of Overseas Trade (Room 42), 35, Old Queen-street, London, S.W.1. (Reference D.O.T. 12091/ED/MP).

CATALOGUES FOR NORWAY.—The Commercial Secretary at Christiania has forwarded a list of certain Norwegian Government Departments who are desirous of receiving catalogues from British firms. The list, which sets out the nature of the requirements of these Departments, can be consulted by United Kingdom firms interested on application to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1.

The London Salon of Photography.

This annual exhibition of pictorial photographs opened last week at the galleries of the Royal Society of Painters in Water Colours, 5A, Pall-mall East, and will remain open until October 6th daily, from 10 a.m. to 6 p.m. The exhibition is one of the looked-forward-to events of the artistic photographers' year, as the aim of its promoters is 'to exhibit only that class of work in pictorial photography in which there is distinct evidence of personal artistic feeling and execution." In the present show there is a fine collection of pictures, which, if we except the few of the "freak" variety, are nearly all noticeable for fine tone and quality, many of them being quite equal to the best class of engravings, and of these we may note "Three Boats," by Alex. Keighley, and "Gordale Scar, Yorkshire," by the same workers, both pictures showing a wonderful expression of light and shade. Another noticeable picture is "Cement Works, Rochester," by J. H. Anderson, in which the photographer has managed to invest a very prosaic subject with an artistic atmosphere, which is helped by the boats which are included in the view. Another apparently unpromising subject is "Twilight—Charing-cross," a Thames view in which the ugly bridge and warehouses are softened down and have quite a glamour thrown over them. A number of the photographs have been taken from a point of view considerably above the subject, in some cases with advantage, in others not. Among the best of these is "A Few Boats," by J. H. Anderson. Worth careful inspection is F. J. Mortimer's "Last Chapter," showing a vessel being broken up. "Kelvingrove," by W. W. Weir; "At Arundel," by Bertram Cox; "Sheep and Sunshine," by J. A. Lomax; "The Peaceful Harbour," by R. J. Delf, and "King's Bench Walk, Temple," by Charles Job. Wonderfully good, too, is "Sunlit Columns," a study of a facade, in which the sunlight on the pillars is most effectively rendered, in fact, it may be classed as the best sunlight picture in the exhibition. In portraiture there are many good examples, notably No. 11, the portrait of a lady, in Japanesque style, in which some bare boughs are introduced in the top right hand corner with good effect. Nos. 227 and No. 34 are good examples of portraiture, the first being by W. Crooke, and the second by Pirie Macdonald, of New York. The exhibition, on the whole, is an excellent show, and is well worth a visit from all who desire to study the possibilities of photography as it is practised to-day, and in these times, when the art is being so closely linked up with printing, it is necessary for the printer to keep abreast of the times in all that appertains to reproductive and illustrative work.

S. & E. Devon Master Printers.

Efforts are being made in the South-Western area of England to strengthen the master printers' organisation, and in this connection a meeting was held on Saturday last at Exeter, attended by printers from Torquay, Paignton, Tiverton, Totnes and Exeter. Mr. W. Townsend, of Exeter, presided and explained the reasons for re-organising the area and bringing into one association the printers of this scattered district.

Mr. John D. Wise, of Battersea, read a most interesting paper on the subject of the benefits which a small printer derives from joining a master printers' association, and he cited a number of telling examples from his own personal experience.

Mr. A. E. Goodwin told of the present activities of the Federation, alluding particularly to the new scheme for collective advertising now under consideration, and remarking that the best remedy for unemployment was to be found in increased use of printing by printers themselves.

Mr. A. H. Pole, of Bristol, attended the meeting on his way to Truro, where he is assisting in the organising of Cornish printers. He also addressed the meeting, stressing particularly the value of the Federation Costing System.

The officers of the new association were elected as follows:—President, Mr. W. Townsend; vice-president, Mr. W. H. Frost; secretary and treasurer, Mr. H. F. Pollard. The executive committee is to be composed of members from every town in the district.

Evening classes open 17th September, 1923.

JAMES BIRD, *Clerk of the London County Council.*

A YEAR'S RECORD—

Twelve months ago a Continental firm of great repute, a house producing the very finest Colour work in many processes ordered ONE Douthitt Diaphragm-Control after seeing a demonstration. They paid the costs of demonstration and also the return fare of the Demonstrator to the Continent. A month later a second complete set was ordered. Still later, order for a third complete Camera, Lens, Prism and Douthitt Diaphragm-Control was received. On Thursday, August 30th, order arrives for a further complete Camera, Lens, Prism and Douthitt Diaphragm-Control—the fourth ordered, and all this in twelve months.

Now what reason can there be for this procedure? Is it because we are right that the Douthitt Diaphragm-Control is the means of saving its cost at least once every year, even in a very small plant, or is it because the concern wants out of kindness to keep us busy? and this, despite the fact that foreign exchanges mean paying so much more to us.

Every printer who makes a photo-litho plate and every process block maker should have the Douthitt Diaphragm-Control affixed to his operator's Camera, and no excuse should be accepted.

We invite all interested to enquire, and offer demonstration by arrangement on customer's own premises. Quality is obtained with greater regularity and at less cost; that's our real sound argument and we can prove this to you.

THURSDAY, SEPTEMBER 13, 1923.

Newcastle and Municipal Printing.

IT will be a matter of general satisfaction to employers in the printing trade that the various attempts which have been made in the Newcastle-on-Tyne district to establish a municipal printing plant have not been successful. A sub-committee was appointed some three years ago, on which the local Labour Party had a majority, and they put forward a scheme for the extension of a small printing plant which is working for the Education Committee. Figures were presented purporting to show that on an expenditure of £24,000 a saving of £8,000 would be made by establishing a municipal printing plant. The Federation of Master Printers, as we have indicated from time to time, have opposed this move very strongly. Mr. James MacLehose made an important speech at Newcastle on the dangers of municipal trading; Mr. E. G. Arnold and Mr. A. E. Goodwin took part in a deputation which waited upon the City Corporation, and other efforts were made to prevent further encroachment upon fair trade. The City Treasurer, as we reported last week, was not in favour of extending the plant of the Education Committee, but suggested that a separate plant, capable of doing about £9,000 worth of work annually should be set up in the Town Hall, and that there would then be friendly rivalry between the Education Department and the Municipal Printing Plant. A letter appeared in the local newspapers from Mr. Goodwin, pointing out the impossibility of estimating the cost of production in a printing plant not in existence, and drawing attention to the fact that under the contract system the Corporation had secured an actual saving of £1,100 on the contracts placed a few months ago, and he made a pointed reference to the difference between estimated savings and actual savings. When the matter was put to the vote in the City Council, at a meeting which is reported on another page, the business men on the Corporation voted substantially against the suggestion of a municipal plant, and the proposal was defeated by 30 votes to 20. We think that master printers as a whole will be grateful to the Federation for the energy and ability they have shown in bringing this matter to a satisfactory conclusion. It is to be hoped that we have now heard the last of this Newcastle effort and that other public authorities will cease to discuss such doubtful schemes for economising on their printing.

* * *

Paper Samples.

THE Post Office officials are still adamant against altering the regulations covering paper samples. A widespread desire exists that these should be allowed to pass through the post at the reduced rate applicable to printed papers, and no little pressure has been brought to bear upon the authorities. Quite recently further representations were made to the Postmaster-General on the question, but the latest reply is that he is unable to assent to the request. The grounds for the refusal are expressed in these words: "The printed paper post already involves a loss to the taxpayer; and any further extension of its scope would increase the loss. Moreover, there is no ground on which a privilege which cannot be extended to samples generally can be accorded to samples of paper; and the re-establishment of a general sample post is open to objection, both on financial and on administrative grounds." The matter, however, is not likely to be allowed to rest here.

* * *

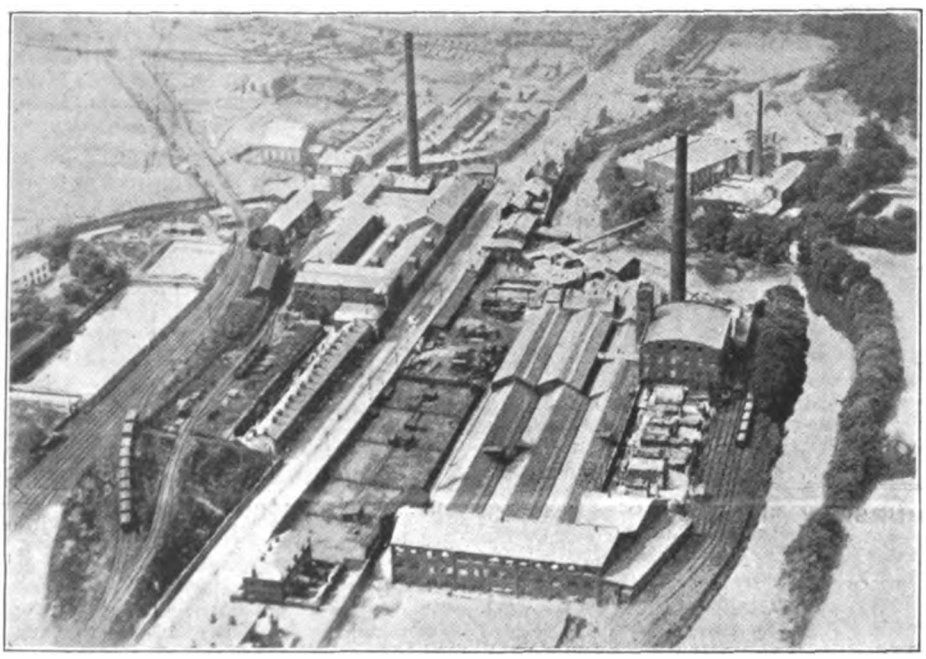
Empire and British Trade.

OUR Colonies are beginning to take an interest in the conditions which govern commerce in this country. One of the subjects which is agitating the minds of leading men in South Africa is that represented by the "disadvantages under which Dominion products labour in competition in Great Britain with foreign products." If our Colonies are concerned over this matter, how much more so are we at home! And yet the governing authorities appear content to allow industry to drift along without offering any assistance. Even a suggestion of interest on the part of the Government, let alone any practical measure of support, would give some heart to those who find present-day conditions so irksome. The problem of Dominion products is likely to be brought up for consideration at the Imperial Economic Conference, whence perhaps a wide expression of opinion will go forth with some effect.

* * *

The Variable Ream.

SEVERAL new paper sample books have been issued recently by certain merchants, and in other cases books have been prepared but not issued owing to price and stock uncertainty. What we notice particularly is that very little regard is being paid to the 500 sheet ream custom. In a new edition before us, issued by one of the leading making and merchanting houses, there are reams of 480, 500, 504 and 516 sheets. Why the merchants should ever have given their official sanction to the adoption of the new custom passes comprehension. The number of houses that have attempted in anything like a genuine manner to give effect to the new ruling could be counted on one hand. It is claimed in defence that the printers do not desire the 500 sheet ream; but if this is the fact now, it was not less the fact months ago, when the new custom was framed. This argument is too weak to hold together; if merchants made their reams up to 500 there would not be one important user in a hundred to object.



VISCOUNT BURNHAM has subscribed £1,000 to the Lord Mayor's Relief Fund for Japan, and various newspapers have made handsome contributions.

Heap Bridge Paper Mills.

Visit of Inspection by Managing Printers.

At the request of Messrs. L. S. Dixon and Co., Ltd., Liverpool, and by the courtesy of Messrs. Yates Duxbury and Sons, Ltd., a party composed of the Lancs members of the Printers' Managers and Overseers Association paid a visit of inspection to the firm's mills (Heap Bridge) on Saturday morning, September 1st. Founded in 1863 by Mr. Yates Duxbury, the grandfather of the present principals, at Hall-i-th'-Wood, near Bolton, Heap Bridge Mill was purchased in 1884, and for over 20 years was an adjunct of the Bolton business. With a view to concentrating the business, in 1908 a large modern mill was erected adjacent to the original mill at Heap Bridge, the mill at Hall-i-th'-Wood, owing to the expiration of the lease, being given up the following year. The firm was later formed into a limited liability company, with Mr. Roger D. Duxbury as governing director. This gentleman died in 1911, since when the

Aerial View of Heap Bridge Paper Mills, Bury.

business has been successfully carried on by his two sons, Messrs. Percival and Norman Duxbury.

On arrival at Bury at 10 a.m. the party, accompanied by Mr. Alec. Dixon, of Messrs. L. S. Dixon and Co., Ltd., was met by Mr. Stanley Voigt, of Messrs. A. C. Beale and Co. Messrs. Duxbury's Manchester agents, and conveyed by a special tramcar to the works, where they were received by Messrs. Percival and Norman Duxbury (directors) and Mr. T. Y. Taylor (secretary). Under the guidance of these gentlemen, assisted by Mr. C. A. Waddicor (inside manager) and Mr. H. Goldsmith (office staff), the tour of inspection was commenced. Passing through the various departments, the visitors were given an insight into the art of papermaking in a modern and up-to date mill, the various processes being explained, from the manipulation of the raw materials to the final sorting in the salle. After spending a most interesting and instructive two hours, the party again boarded the car and returned to Bury, where they were entertained by the firm to luncheon at the Derby Hotel at 1 p.m., Mr. Norman Duxbury presiding.

At the conclusion of an excellent meal, Mr. C. Mackie (president Liverpool Centre) said they could not depart without expressing their great appreciation of the privilege granted by Messrs. Yates Duxbury and Sons in having been permitted to inspect their thoroughly equipped and up to-date mills, and to see the wonderful and expeditious way every department was carried on. He believed they were second to none in the country. (Hear, hear.) It was indeed a great privilege to visit such mills, where up-to-date methods and appliances were employed. It was, of course, the object of the modern mill to increase production and also to improve the quality of the paper. They had seen how a modern paper mill was carried on, thanks to the several gentlemen who had shown them round and explained everything possible in the short time at their disposal. He therefore proposed a very hearty vote of thanks to the directors of the firm for the very interesting and instructive morning they had spent and for their generous hospitality. (Applause).

Mr. F. E. Robinson (president, Manchester Centre), in seconding the vote of thanks, said they were very much indebted to the firm and the gentlemen who had piloted them round, explaining in detail the various points of interest, which to him especially as a printer were very instructive. It had occurred to him in looking at the huge cylinders, that it would be desirable if a more thorough process of drying the paper could be adopted. At times printers had experienced trouble through contraction and expansion of paper and they had to devise means of drying the paper before putting it on the machines for printing. He endorsed all that Mr. Mackie had said respecting their indebtedness to the firm and he would include in the vote of thanks the gentlemen who had conducted them through the mills. (Applause.)

In responding, Mr. Norman Duxbury said he felt sure these visits between kindred trades were to the good of all concerned. Speaking for himself, he had quite enjoyed their visit and it had been a pleasure explaining the various processes in the art of papermaking. Bury, as they were already aware, was a papermaking centre, and as a firm they were proud of their association with such a centre and he highly appreciated the kind words that had been expressed in relation to their mills. In regard to Mr. Robinson's technical query, he thought he had better leave it alone, but would make a mental note of it and at some future time would discuss it further. He thanked Mr. Robinson, however, for the suggestion put forward. These meetings tended to promote good will all-round and gave an opportunity of mentioning points of interest and difficulties to discuss and solve if possible, which was of mutual benefit to papermakers and paper buyers. He thanked them most heartily for the vote of thanks. (Applause.)

Mr. Jas. N. Poole (secretary, Liverpool Centre) said they were indebted to Messrs. L. S. Dixon and Co. for the arrangements made for visiting Messrs. Duxbury's mills. They had the pleasure of having with them Mr. Alec Dixon, representing the firm. They were also indebted to Mr. Voight, of Messrs. A. C. Beale and Co., Manchester, for his share in the excellent arrangements made for the visit.

Mr. F. Scouler (vice-president, Manchester Centre) said he had been greatly impressed by what he had seen at the mills, especially the wonderful dexterity shown by the work people and with the small amount of manual labour required. The manner in which the girls manipulated the sheets of paper and the counting of reams was a striking contrast to the method employed in printing offices.

Mr. Alec Dixon said it had been a pleasure on the part of his firm to arrange the visit. It was as well for paper users such as printers and others to see the process of making paper and the difficulties and troubles that paper-makers and paper merchants had to contend with. In regard to Mr. Robinson's trouble with contraction and expansion, he would suggest that the difficulty could be met by relying upon the paper merchant who could always be depended upon, having matured paper, carefully housed in his properly heated warehouse, kept at a certain temperature so that by the time it came out it would be in a perfect condition and would neither contract nor expand, but would be everything a printer could desire. (Hear, hear and laughter.)

Mr. Voight said he hoped after what they had heard from Mr. Dixon they would have a little more sympathy with the papermaker in times of difficulty, which sometimes might be traced to the ink. (Laughter.)

The following were present:—Mr. Alec Dixon (L. S. Dixon and Co., Ltd.), Mr. S. Voight (Messrs. A. C. Beale and Co., Manchester), P. M. and O. A., Liverpool Centre (Mr. C. Mackie, president, Mr. Jas. N. Poole, secretary, and 20 members), Manchester Centre (F. E. Robinson, president, Mr. F. Scouler, vice-president, Mr. F. J. Hughes, secretary and five members).

Personal.

Sir Adolph Tuck, Bt., and his son, Capt. Desmond Tuck, left London last week for Paris.

On the occasion of the retirement of Mr. C. W. Bowerman, M.P., from the secretaryship of the Trades Union Congress, the Congress paid high tributes to the value of Mr. Bowerman's services. Presentations were made to Mr. Bowerman and to Mrs. Bowerman, and Congress voted a retiring pension of £300 a year.

At a meeting of the executive of the Home Counties Master Printers' Alliance, held at the Holborn Restaurant on Tuesday, honour was done to Mr. T. J. S. Guilford, the retiring treasurer. The president of the Alliance, Mr. S. F. Oxley, of Windsor, handed to Mr. Guilford a handsome silver bowl, together with a silver-topped scent bottle for Mrs. Guilford. The bowl bore the inscription "1919-1923—Presented to Mr. T. J. S. Guilford by Members of the Home Counties Master Printers' Alliance on his retirement from the office of hon. treasurer."

Mr. C. A. Bates (Messrs. Johnson, Riddle and Co., Ltd.) gave an interesting talk on his recent experiences in the United States at the re opening meeting of the Association of Master Printers of S.E. London at the Bridge House Hotel, London-bridge, on Tuesday evening.

Among those present was Mr. W. A. Northam, who is remembered as occupying the post of president in the early days of the Association. He has re-entered the fold of the printing industry after an absence from it of several years.

Mr. Frank Colebrook delivered an address at the Unitarian Church, Maidstone, on Sunday, taking as his subject "The Religion of a Journalist." As might be expected, he drove home in an informative and interesting fashion his plea for a high ethical standard in journalism.

Mr. W. Willett, assistant secretary to the Federation of Master Printers, is resigning that position in order to take up an appointment as London manager of Messrs. Turner and Dunnett, Ltd. Mr. Willett has made himself very popular with members of the Federation, and there will be general regret at his severing his connection with Federation headquarters.

Mr. L. J. Cumner has been visiting the area of the North-Western Alliance of Master Printers, and a very useful meeting has been held at Whitehaven, whilst arrangements are being made for meetings at Kendal and Barrow in the near future. Mr. Cumner's next move will be to North Wales.

Mr. W. H. Powlson, the new president of the North Wales Alliance of Master Printers, is doing good organisational work in visiting various parts of that scattered district. A successful meeting was held at Carnarvon last week, and arrangements are being made for future meetings in Mid Wales.

DIVIDENDS AND REPORTS.

VALENTINE AND SONS.—Directors of this well-known firm of colour printers, publishers, etc., report that net loss for year is £1,696, and adding balance brought forward debit balance to be carried forward amounts to £4,399. Trading results were seriously affected by increased postage on postcards. Slight improvement was experienced in the autumn, due to partial concession granted by Post Office. This improvement has been maintained, and has been sufficient to enable business to regain profit-earning basis.

NEW COMPANIES.

J. AND J. MURDOCH, LTD.—Capital £15,000 in £1 shares (10,000 preference and £5,000 ordinary); to carry on all or any of the businesses of printers, stationers, lithographers, typefounders, engravers, bookbinders, booksellers, etc. Private company. First directors: J. Murdoch and A. B. Murdoch. Registered office: 32, Albion-street, Glasgow.

LEGAL AND COMMERCIAL LITHOGRAPHERS, LTD.—Capital £300 in £1 shares. Private company. First directors: J. H. Widgery, A. L. Rogers, G. S. Percival, G. Aldersley and W. H. Lomas. Registered office: 10, Gate-street, W.C.1.

GEO. ESTILL, LTD.—Capital £1,000 in £1 shares (500 10 per cent. preference and 500 ordinary); general providers, including fancy goods, printing, bookbinding, advertising, etc. Private company. First directors: G. Estill, Mrs. Ethel Estill, Mrs. Elizabeth Estill and O. Hutchinson. Registered office: Market street, Easingwold.

J. G. GRELLIER AND SONS, LTD. — Capital £1,000 in 999 preference shares of £1 each and 20 ordinary shares of 1s. each; to take over the business of a printer and stationer carried on by H. R. Grillier at 302, Gray's-inn-road, W.C., as "J. G. Grellier and Sons," and to carry on the same and the business of bookbinders, publishers and paper merchants, etc. Private company. Directors: H. R. Grellier, W. H. Smith and C. F. Grellier. Registered office: 302, Gray's-inn-road, W.C.1.

WOMEN PUBLISHERS, LTD. — Capital £10,000 in 8,000 10 per cent. non-cumulative preference shares of £1 each and 40,000 ordinary shares of 1s. each; to acquire the business of publishers, etc., carried on as "The Economic Press" at 9, Aldwych-chambers, Strand, W.C.2, and elsewhere. Private company. First directors: Gladys E. Gates and Mrs. Lorna Rea. Registered office: 9, Aldwych-chambers, 170, Strand, W.C.2.

STANLEY PAUL AND CO., LTD. — Capital £15,000 in £1 shares; publishers, booksellers, etc., as carried on by S. Paul as "Stanley Paul and Co.," and "Greening and Co." Private company. Subscribers: S. Paul and E. H. Wingfield. First directors: S. Paul and G. T. G. Mackern.

ACME CORRUGATED PAPER AND BOX CO., LTD.—Capital £3,000, in £1 shares; manufacturers of cardboard, corrugated paper and board, cardboard boxes and cartons, etc. Private company. First directors: E. C. Howard and A. E. Davies.

AUSTRALIAN PAPER CO. — Particulars of B. J. Ball, Ltd., filed on August 29th, 1923, pursuant to Section 274 of the Companies (Consolidation) Act. Capital £62,000, in 9,000 7 per cent. cumulative preference, 12,000 8 per cent. second cumulative preference and 36,000 ordinary shares of £1 each, and 10,000 employees' shares of 10s. each. Company was incorporated in New South Wales on April 12th, 1918, to take over the business of paper merchants and importers of twine carried on by B. J. Ball, Ltd., at Sydney and at Brisbane. British address, 79, Queen Victoria street, E.C. H. E. Poole, of Regent Palace Hotel, Piccadilly, W., is authorised to accept service of process and notices on behalf of the company. Directors: B. J. Ball, Sydney; H. E. Poole; A. F. Ware, Melbourne; and R. M. Clark, Sydney.

BEDFORD MILL PAPER WORKS, LTD.—Capital £500, in £1 shares; to adopt an agreement between P. Holman of the first part, Dorothy M. Holman of the second part and A. J. Williams of the third part, to carry on the business of a toilet roll and paper cutter and paper merchant now carried on by P. Holman at 34, Cheapside, Luton, as "The Bedford Mill Paper Works," and to carry on the business of makers of paper bags and cardboard and other boxes, etc. Private company. First directors: P. Holman and Mrs. Dorothy M. Holman. Registered office: 4, Bishopsgate-avenue, E.C.2.

E. C. LOVELL AND SON, LTD. — Capital £10,000, in £1 shares (2,000 6 per cent. perference and 8,000 ordinary); to acquire the business of a cardboard canister manufacturer now carried on by Rose Lovell at St. Andrew's-road, Montpelier, Bristol, as "E. C. Lovell," and to carry on the business of papier-mache manufacturers, japanners, cardboard and cardboard box makers, band box makers, toy makers, machinists, machine manufacturers, manufacturers of boxes, canisters, drums and kegs of tin or other metals, etc. Private company. First directors: Mrs. Rose Lovell, H. C. Lovell, A. F. F. Harding, and Captain J. Small. Registered office: 1, St. Andrew's-road, Montpelier, Bristol.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act. 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

LOXLEY BROTHERS, LTD. (printers, publishers, etc.).—Deposit on August 11th, 1923, of deeds (without instrument) of various properties in London and Sheffield to secure all moneys due or to become due from company to London Joint City and Midland Bank.

HUNTERS, LTD (manufacturers of, agents for and dealers in printing and other machinery, etc., London).—Land registry charge on 16-18, St. Bride-street, E.C., dated August 9th, 1923, to secure all moneys due or to become due from the company to the London Joint City and Midland Bank.

ODHAMS PRESS, LTD.—Trust deed dated August 3rd (supplemental to trust deed dated January 31st, 1923) securing £367,500, being debentures for £350,000, secured by the principal deed, and a premium thereon of 5 per cent., charged on 57 and 59, 64 and 85-94, Long-acre, W.C., 27, St. Bride-street and 10, Shoe-lane, E.C., 4,490 £5 shares in Dean and Sons, Ltd., 28,874 £1 ordinary shares in Kinematograph Publications, Ltd., and 3,000 £1 ordinary shares in Gosnay Advertising Co. (1919), Ltd. (all fully paid), and the company's other assets, present and future including uncalled capital. Trustees: Rt. Hon. Viscount Long and Sir Howard Spicer, K.B.E.

DIRECT PHOTO ENGRAVING CO., LTD. (London).—Particulars filed of £1,000 debentures authorised August 16th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £300.

ABBOT PPESS, LTD. (printers, stationers and booksellers, Yeovil and London).—Satisfaction in full on August 18th, 1923, of mortgage dated September 9th, 1919, securing all moneys due or to become due from company to the London Joint City and Midland Bank.

ABBOT PRESS, LTD. (printers, stationers and booksellers, Yeovil and London).—Two mortgages, one dated August 20th, and the other dated August 21st, 1923, to secure £1,050 and £150 respectively, charged on certain properties in Yeovil. Holders: H. de B. Porter, the Ecclesiastical Commission 1, Millbank, Westminster, and others.

MONTGOMERYSHIRE EXPRESS, LTD.—Satisfaction in full on March 24th, 1923, of mortgage dated March 3rd, 1920, securing £800.

EAGLAND AND CO., LTD. (newspaper proprietors, etc., London).—Satisfaction to the extent of £2,000 on August 22nd, 1923, of debentures dated May 16th, 1905, securing £7,500.

BANKRUPTCIES, etc.

Re GEORGE HARRISON (a firm), paper agents, 32, Queen Victoria-street, E.C.—A general meeting of creditors under the failure of Godfrey Isaacs and Michael Levy, who traded under the above style, was held at the London Bankruptcy Court on September 6th, before Mr. F. T. Garton, official receiver. The debtors have lodged an amended scheme providing for the withdrawal of claims and the payment of a cash composition on the remaining debts. The official receiver reports that the scheme is reasonable and calculated to benefit the participating creditors. A vote having been taken, the chairman declared that the offer had been accepted by a statutory majority of creditors.

Re J. H. MILLER, LTD., stationers, 26, Ludgate-hill, E.C.—Under the compulsory liquidation of this company, accounts have been filed showing liabilities £1,605 against assets and bad book debts £24 and a deficiency of £4,857 as regards contributories, the issued capital being 500 ordinary and 2,752 preference shares of £1 each. Mr. E. T. A. Phillips, official receiver, reports that the company was incorporated as a private company on March 17th, 1920, with a nominal capital of £7,500, divided into 3,750 preference shares and 3,750 ordinary shares of £1 each, and was promoted by George Reginald Hudson for the purpose of entering into an agreement for the purchase of the business of stationers, manufacturers of pencils, pens, and stationers' novelties, etc., carried on by Mr. James Miller under the style of J. H. Miller and Co., and to carry on the same. The purchase consideration was £3,458 nearly all in cash and was based upon the cost of the manufacture of the machines, etc., and installation thereof. The trading accounts of the company show a gross profit of £4,295, but a net loss of £968. From the inception of the company down to November 30th, 1922, the losses incurred being due to trade depression, to which fact, combined with the seizure of its assets by the landlord in the last-named month the failure is attributed. The stock, plant and machinery were sold by order of the Sheriff and realised £84 11s. net.

Trade Notes.

IT will be noted that the Borough of Lambeth, whose advertisement of tenders for printing appears on another page, intend to cover their printing requirements for a period of three years—not only twelve months, as has erroneously been stated elsewhere.

PARTNERSHIPS dissolved announced during the week include that between G. G. Jacob and E. E. Jacob, rag and paper merchants, at Eagle Wharf, Hill-street, Rye-lane, London, S.E.15, under the style of Alexander Jacob and Co.; and that between E. Blackmore, A. Blackmore, and R. Blackmore, fashion publishers, 138 and 140, Drummond-street, Euston, London, under the style of the Blackmore Fashion Company; so far as regards A. Blackmore.

AT the Faversham County Petty Sessions on Thursday, Claude Edwards, stated to be in the employ of the *Daily Sketch*, London, was summoned for driving a motor car to the common danger, at Ospringe-street, Ospringe, on August 12th. Excessive speed was apparently due to an urgent reporting engagement. The magistrates decided to convict, fixing the fine at £10, and ordering that defendant's license should be endorsed.

AT the autumn conference of the Institute of Metals in Manchester on Tuesday, the mechanical side of newspaper production came under review, and a paper by Messrs. A. H. Mundey and John Cartland on the subject of stereotyping was amongst the contributions to the proceedings.

THE intended visit of the president and secretary of the Federation of Master Printers to America is now unlikely to take place this year, owing to circumstances which have arisen since the idea was first entertained.

THE West and North-West London Master Printers' Association are opening their winter session on Monday, September 24th, when Mr. W. H. Sessions of the Ebor Press, York, whose address on the "Causes of Variations in Estimates," attracted so much attention at the last Cost Congress, will speak on "A Printer and his own Advertising." The meeting will be held at Westbourne Park Institute, Porchester road, Bayswater, at 7 p.m.

DAILY HERALD'S CRISIS.—At the Trades Union Congress on Friday it was decided to continue the publication of the *Daily Herald* until the end of the year if the unions pay to the general council during the present month the sum of £12,500. It is only upon the fulfilment of the condition of this money being actually paid that the general council agree to accept the responsibility for the future existence of the paper.

MR. JAMES M. TUOHY, European manager of the *New York World*, from 1897 until early this year, died on Friday at his London residence. Mr. Tuohy came to London as correspondent for *Freeman's Journal*, in 1881, which paper he served in London for upwards of 30 years.

THE death at the age of 93 is announced of Mr. William Pickering, who for many years edited the *Newcastle Courant*.

LATEST WILLS.—The late Mr. Arthur Edmund Spender, of Shrewsbury, editor of the *Shrewsbury Chronicle*, for many years managing director of the *Western Morning News*, Limited, a former chairman of the Committee of Management of the Press Association, and a former president of the Newspaper Society, who died on July 6th, aged 52, left unsettled property of the gross value of £21,185, with net personalty £18,221. Mr. Charles Coppack, of Leicester, newspaper proprietor and director, editor of the *Midland Mail*, Market Harborough, who died on February 27th, aged 82, left estate of the gross value of £3,253, with net personalty £2,868. Dr. Henry Bradley (77), Fellow of Magdalene College, Oxford, senior editor of the Oxford English Dictionary, left £3,601 (net personalty £3,460).

MR. EDWIN W. EVANS, 150, Fleet-street, London, E.C.4, has just issued a new brochure relative to fire insurance, which shows the great importance of having a detailed inventory of one's plant, and that moreover a saving is generally effected in premiums. A detailed inventory and valuation is more than ever necessary now for income tax purposes, so as to claim the full allowance for depreciation, which is an important matter with the tax at the present high rate. Many other useful points are also dealt with in the brochure.

A NEAT illustrated folder is now available describing the new H.T.B. Model "Slogger" Automatic Sheet Feeder, to which reference was made in our last issue.

PAPERMAKERS and wholesale stationers are amongst those branches of the allied trades showing marked enterprise in catering for Colonial requirements, a notable example being the house of Spicers Limited who are well represented in Australasia, South Africa and elsewhere. Messrs. Spicers' Australian branches, by the way, go under the style of Spicers and Detmold, Ltd.—not Spicers and Detnold, Ltd., as erroneously cited in our last week's issue.

A GERMAN book printing exhibition has been opened in Moscow and is said to be doing good business.

Newcastle-on-Tyne & Its Printing.

Municipal Plant Proposal Defeated.

Following upon the decision of the printing committee of the Newcastle Corporation (reported in our columns last week) to support the City Treasurer in proposing that a municipal printing plant be installed in addition to that already in use by the Education Authority, the City Council considered the matter at a meeting on Wednesday of last week, when the printing committee's report was presented.

Mr. Locke moved, and the Sheriff (Mr. David Adams, M.P.), seconded, the confirmation of the report. Mr. A. W. Lambert said that 17 months ago, when he moved the deferring of the matter, he was not satisfied that they were getting keen competition among the printers of the city. From inquiry into the whole matter by the Finance Committee, and in going into the contracts, he had satisfied himself that there was keen competition. He was convinced that the Council would be very unwise to set up a municipal printing department. By doing so they would be giving great discouragement to some of their oldest and most respected ratepayers in the city.

The Sheriff, in the course of the discussion, alleged the existence of a printers' "ring," and made some remarks that must sound rather amusing to printers faced with present-day reckless competition and price-cutting. He said there must be a "ring," because printers met regularly together and had adopted a costing system which deprived the public of the benefit of free competition. Once a customer went to a certain printer he was looked upon as a fair game for that printer. He was at that printer's mercy, and except under exceptional circumstances they would not find another printer tendering below.

On a division, the report was rejected by 30 votes to 20, two members declining to vote.

Trade Union Matters.

L.S.C. AND THE LONDON COUNTY COUNCIL.—In accordance with a resolution passed at the special general meeting of the political section of the London Society of Compositors to finance two candidates for the London County Council, up to a sum of £60 each, nominations are invited, and should reach the secretary by Saturday next. Final choice of candidates will be made at the annual meeting of the section on Wednesday, September 19th. The candidates must be prepared to devote the time necessary to the work of the L.C.C., and must signify their willingness to stand as Labour candidates.

T.A.'s FINANCES.—The Executive Council of the Typographical Association have decided to call for a levy towards the General Fund for the quarter ending September, in accordance with Rule XX., clause I.:—"Should the half-yearly balance-sheet of the Association show a smaller sum than £6 per member on the books, irrespective of the Superannuation Fund, a levy shall be made on all the members in the proportion of 1s. per quarter for those who are fully employed, or are earning more than three-fourths of the established wages, and 6d. per quarter for those earning more than one half of the established wages. Such levy to continue in force until the sum in the exchequer of the Association is raised to the aforesaid £6 per member, when it shall cease."

THE Typographical Association holds its next triennial delegate meeting next year. The Executive Council have not yet taken any steps towards selecting the place of meeting, but they are open to receive invitations from branches.

T.A. AND APPRENTICES' WAGES.—The Executive Council have received from the secretary of the Yorkshire Group of the Association a resolution passed at the annual meeting of the Group asking the Council to institute negotiations with the Federation of Master Printers with a view to obtaining a stabilised rate of wages for apprentices, such rate to be an advance on the recommendations made by the members of the Newspaper Society.

T.A. AND MARITIME MEMBERS.—The Executive Council of the Typographical Association have recently had under consideration an appeal for the payment of out-of-work benefit by a maritime member of the Liverpool branch, who was at sea at the end of the Association quarter and unable to clear his subscriptions, and in consequence was debarred from benefits. The Council have decided that such members as were at sea at the quarter-end will be permitted to remain in benefit provided they clear off arrears of subscriptions immediately on return to port.

JOURNALIST AND UNEMPLOYMENT BENEFIT.—The National Union of Journalists have been successful in an appeal against the withholding of unemployment benefit by the Labour Exchange from a journalist who had been dismissed from his employment for alleged insubordination. He had been employed on a weekly newspaper for four months and asked leave for a long week end to visit his home. His employer granted only Saturday afternoon, and the journalist, on taking the Monday off, received notice to terminate his engagement. The employer notified the Labour Exchange that the employee had left owing to insubordination, and the Exchange in consequence declined to pay benefit. The union appealed against the decision on the ground that the member, who had not had leave for four months, was justified in his action, and the Court of Appeal decided in their favour.

(PARENT) ASSOCIATION.

September Meeting and Members' Concert.

Despite the holiday season a very fair number of members put in an appearance at the September meeting of the P.M. and O.A., held at the Old Bell, Holborn, on Tuesday of last week. About an hour was spent in dispatching the business of the evening, after which came a concert, the talent for which was recruited wholly from the ranks of the Parent Association. The president, Mr. S. M. Bateman, was in the chair.

New Members Elected.

As usual, there were submitted for approval a number of nominations for membership, and the following gentlemen were elected members of the Association, each receiving a personal welcome from the president: Mr. A. H. Lovell (Millington and Sons, Ltd., Tottenham, manager—printing department), Mr. H. V. Dove (Britannia Folding Box Co., Ltd., Old Ford, E.3, works manager), Mr. S. Nadell (Merivale Press, Ltd., Cowcross-street, E.C., overseer—letterpress department), and Mr. W. W. Rosenfeld (Edsom (Printers), Ltd., Stoke Newington, N.16, overseer—composing department).

Deficit on United Gathering.

Attention next centred upon a recommendation of the council suggesting that £15 be granted to the Leicester Centre of the Association towards the expenditure incurred at the recent United Gathering.

The chairman explained that it was felt that some assistance should be given to Leicester, especially as that centre was a small one, and there remained a deficiency of over £34 in respect of the heavy expenses incurred.

The general secretary, Mr. E. W. Whittle, moved the adoption of the recommendation, but intimated that the figure of £15 was open to alteration. Mr. G. H. T. Freeman seconded, but suggested that someone outside the council should put forward an amendment making the sum £20. An amendment to that effect was then moved by Mr. Blackwell, seconded by Mr. Lowe, and carried, after which the chairman put to the meeting the original recommendation, altered to specify £20 instead of £15, and this was agreed to unanimously.

Unemployment Benefit.

At this point the meeting resolved itself into a special general meeting to consider a recommendation from the delegate meeting concerning an alteration to rule.

After the adoption of the alteration had been formally moved and seconded, there followed a good deal of discussion.

Mr. Freeman asked if it was to be understood that all future members aged 50 or over, although they would pay the same amount of subscription as other members, would receive no unemployment benefit.

The chairman replied in the affirmative, and the general secretary corroborated, adding that consideration had been given to the question of reducing the subscription, but it was thought that the sum was already small in proportion to the advantages accruing, and that members joining above the age limit specified would not expect to be qualified for unemployment benefit.

The chairman then put to the vote the adoption of the first paragraph of the recommendation, and this was carried with only two dissentients.

Mr. Dawson, at this point, protested against "tinkering" with the Association's rules. He said that not a single reason had been put forward that evening for the proposed alteration, and he wanted to know who was going to benefit, or who was going to be roped in by the new rule.

The chairman and the general secretary both replied to the effect that there was no personal motive behind the alteration—which had been drafted by the Manchester Centre—but that experience had shown that in order to put matters on a more satisfactory business basis, an alteration was desirable. It was recalled that a very similar proposal of alteration had been discussed fully at their own meeting in May and approved.

The vice-president, Mr. R. H. Berry, confirmed the reference to the May meeting, and at his suggestion the secretary read apposite passages from the minutes.

The whole recommendation was then put to the meeting and carried with but a single dissentient.

The only matter arising under "General Business" was the announcement of the death of one of the Association's oldest members, Mr. H. Blanks. On the motion of the chairman it was agreed that the secretary write a letter of sympathy to the relatives of the deceased.

Concert by Members.

The members' concert which followed showed that many a P.M. and O.A. member can sing a good song, and that some are the possessors of marked musical talent. The duties of pianist and accompanist were ably discharged by Mr. Langley; the singers included Messrs. Whitehead, King (who also told some very entertaining stories), Bell, Earl, Dernie and Tomlin, whilst Mr. J. J. Smith once more added to his reputation as a raconteur.

The thanks of the meeting were well expressed by Messrs. Burton and Curtis, who congratulated the artists and expressed indebtedness to Mr. Arthur W. Paul, who was principally responsible for the concert arrangements. The meeting ended with a brief response from Mr. Paul.

Printing, Bookbinding & Kindred
TRADES OVERSEERS' ASSOCIATION.

The Factory Acts Discussed.

There was a good muster of members of the Association at the monthly meeting, held on Tuesday of last week at St. Bride Institute, Bride-lane, E.C.4, the chair being occupied by the president, Mr. H. Milton. Prior to the commencement of the proceedings, opportunity was taken by the members to indulge in social intercourse, in which holiday experiences formed the principal topic.

After the reading of the minutes—which were confirmed—several items of correspondence were presented to the meeting.

Among the letters received was one from Mr. Riddell, again reminding the members of the opening of the new term at the Central London Printing School. Another letter drew the Association's attention to the fact that one of their members, Mr. F. S. Barnett, had commenced business on his own account, trading as Barnett and Ferguson. A further letter had reference to a deceased member who was in arrears at the time of his demise and who in consequence had not received death benefit.

Arising out of the contents of the last letter a long discussion took place as to whether the deceased member's next-of-kin was entitled to the benefit under the rules. In connection with this question the executive's decision, already given, was unanimously endorsed by a vote of the members.

The president reminded those present that a new list of members was being prepared, and any corrections on the old one should be sent to the secretary immediately.

Confirmation was next given to the selection of the Talbot Restaurant, London-wall, as the venue for the annual bohemian concert to be held on December 1st.

Mr. J. S. Dixon facetiously remarked that as they were all doing so well he thought they should make a charge this year for the concert. This suggestion was put to the meeting and it was agreed to make a charge of 1s., including tax.

Mr. A. J. Jones, one of the stewards for the members' "smoker" to be held at the Talbot Restaurant on Tuesday, October 2nd, reminded members that he was still requiring talent from amongst them, and he would like to hear promptly regarding their intentions, so that he could arrange the programme.

The remainder of the evening was thrown open, in order to give opportunity to the members to ventilate their views on any subject of trade interest.

Mr. Cox raised the question of the inadequate precautions taken in many binderies to safeguard the workers in case of fire. He thought there were too few visits paid by factory inspectors. If information was given by a worker to a factory inspector regarding inadequate protection against fire or other evils he was in many cases a marked man, and would have to suffer for it sooner or later. The Factory Acts should receive more consideration from their side of the trade, and he would be glad to hear members' opinions on them.

Mr. Dixon said the remedy was quite simple. If grievances of the kind as Mr. Cox had suggested did exist, he thought if they reported the matter to their trade society a move would be made towards improving the conditions.

Mr. Chris. Atkins thought it was the first duty of the factory inspector to see that conditions were safe for the worker in the event of fire. Unfortunately the factory inspector, it seemed to him, spent most of his time in visiting buildings that were in order, and left the rabbit hutches alone. He believed that if any worker gave information to a factory inspector as to the insanitary or other bad conditions around him absolute secrecy would be maintained. Years ago the firm where he was working at the time used to print the Factory Acts, but the strange thing was they never had one copy of it posted up. They should all see that no one was allowed to ride rough shod over the Factory Acts. He did not think it would be the employer who would mark a man if he gave information as to bad conditions of working. Employers knew only too well the better results obtained by clean and wholesome conditions of labour. He regarded it as befitting the dignity of the overseer to see that he and those under him had a decent place to work in.

Mr. Milton described the working of the welfare committee in existence at his firm. This committee, at whose meetings one of the directors was always present, met once a month, and questions regarding the welfare of the workers were discussed. No matter what subject was brought up full attention was given to it. There were times even when suggestions were introduced involving an expenditure of four or five thousand pounds. As an illustration of the good effects obtained by this welfare committee in improving the conditions of the workers they might be interested to know they had only had one visit from a factory inspector in four years, and that was in the case of an accident.

At the conclusion of the discussion of the topic raised by Mr. Cox a brief period was usefully occupied by members asking questions of one another regarding *methods* and difficulties met with in their different establishments.

In reply to a question on the new class for women binders Mr. Sansom said he believed applications had been quite numerous and satisfactory. There was every facility now placed at the School for teaching girls, and there was no reason why it should not be a good class.

A vote of thanks to the chairman brought the meeting to a close.

Necrology

Mr. Owen Connellan, J.P.

The death occurred on Sunday morning at Leeds of Mr. Owen Connellan, a prominent member of the Leeds City Council and acting Deputy Lord Mayor, for many years one of the leading members of the Executive council of the Typographical Association. Mr. Connellan worked for some years as a compositor at Bradford, and during that time became president of the Bradford branch of the Typographical Association. Later he went to Leeds, and for 24 years was a member of the composing-room staff of the *Yorkshire Evening Post*, serving for a time as Father of the Chapel. He became president of the Leeds branch of the Typographical Association, and for many years was the local representative on the Executive Council. Some time ago he was adopted as the Typographical Association Parliamentary candidate, and in that capacity contested the North Bucks Division at the last general election. For many years Mr. Connellan had been a Justice of the Peace for the City of Leeds, and since 1912 had been a member of the Lord Chancellor's Advisory Committee for the nomination of persons to the magistracy. During the War he was a member of the Military Service Tribunal, the Leeds Pensions Committee and the Food Control Committee. Since 1892 he had been the secretary of the Leeds Trades and Labour Council. A man of moderate views, Mr. Connellan was held in high respect, particularly by employers and employees in the printing trade.

THE

Evolution of Paper & Papermaking.

By H. A. BROMLEY

(Examiner of Supplies to H.M. Stationery Office).

The address which Mr. Bromley delivered from the London Wireless Station (2L.O) on August 28th was much appreciated by the many thousands of listeners-in. In the short space of ten minutes he was able to give a broad but comprehensive review of the history of papermaking from the earliest times down to the present. With the permission of the B.B.C. we are able to afford more permanent form to the address.

I think most of us are accustomed to consider paper simply and solely as the recognised medium for recording our ideas in written or printed characters, and it is seldom that we stop to think what a ubiquitous material paper really is, or to what a great and increasing extent we rely upon it in one form or another to meet the most varied requirements of our 20th Century lives. We no doubt accept its existence as one of the settled facts of life which for us has always existed, and as to the origin of which we never trouble to enquire, but assume it, like Topsy, to have merely "growed." Yet I venture to say that if the supply of this commodity were suddenly to be cut short the whole fabric of our civilisation would experience more or less complete disorganisation.

Paper has not always been man's means of recording his ideas. Primitive man wrote his correspondence and developed his artistic sense upon the walls of the sandstone caves in which he evaded the unwelcome attentions of his natural enemies. In somewhat later times skins of fishes, animal gut, tortoise shells, leaves, the bark of trees, stone, bricks, lead, wood, ivory and wax have been used also. We are told, for instance, that Moses took down the ten commandments upon tablets of stone, while a Brahmin MS. preserved at Oxford is written on palm leaves. The era of paper proper begins at a comparatively late period—in fact, about 200 B.C.; but prior to this we meet a period of time during which the idea of a vegetable fibrous material was gradually evolving—I mean the period covering the use of papyrus. Papyrus is a species of reed growing in vast quantities on the banks of the Nile and in Sicily. In applying it to the purpose the stem was divested of its skin and the interior pith sliced into thin strips or laminæ, which were spread lengthwise on a slab and moistened with Nile water. Another layer of strips was placed crosswise on the first and the whole pressed together to form a coherent sheet—or as the Romans called it later a 'plagula'—which was then dried in the sun and afterwards glazed with a tusk or tooth. The date of the earliest specimen of papyrus extant is about B.C. 3500.

Parchment supplanted papyrus in general use about the eighth century A.D. but papyrus continued to be used in Italy until the eleventh. The Gospel of St. Mark preserved at Venice is on papyrus.

The manufacture of paper proper is supposed to have commenced in China about 200 B.C., the raw materials used being probably the mulberry plant and bamboo, the Prince Imperial of the Wei Dynasty being known to have used some sort of paper handkerchief. There are many interesting speculations as to the subsequent introduction of paper as we know it into Europe about A.D. 800 with which unfortunately time will not allow me to deal now—we must turn at once to what may be called the modern period.

In 1276 paper was being made at a mill in Italy, and in 1307 the manufacturer's name is found introduced into the paper as a watermark for the first time. In 1355 the price of a quire of small folio paper in London was 5d. Very dear!

We find the earliest record of an English paper mill in that built by John Tate at Stevenage in 1495. In 1498 the Record of Domestic Accounts of Henry VII. contains an item of 16s. 8d. for a "rewarde given at the Paper Mille.' 1588 Sir John Spilman had a mill at Dartford. He was originally Queen Elizabeth's jeweller, and was granted a licence or patent for gathering raw material and making white paper. All other persons were forbidden to manufacture for a period of ten years.

Shakespeare has an interesting reference to paper manufacture in Henry VI. in which Jack Cade indicts Lord Saye in these words: "Thou hast most traitorously corrupted the youth of the realm in erecting a Grammar School; and whereas before our fathers had no other book but the score and tally, thou hast caused printing to be used, and contrary to the King his Crown and Dignity thou hast built a paper mill." Evidently progress and revolutionary new methods were as little relished in some quarters then as now.

By 1650 hangings of paper had superseded arras, and in 1696 the annual value of English paper was £28,000. At this time all paper was made from rags and by hand and it was not till 1756 that attempt was made to employ any other raw material. In that year straw was first brought into use in Germany. In 1766 Whatman had a mill at Maidstone and in 1803 the first papermaking machine was erected by Fourdrinier at Frogmore. About 1840 Keller of Germany first applied wood pulp to papermaking. The tale goes that observation of the habits of wasps which are known to chew wood and thus produce a material resembling paper for lining their nests was responsible for the idea. In 1854 a process for applying to papermaking wood pulp produced chemically was patented in England, and in 1861 Routledge introduced to the industry the use of esparto grass. In this year also the excise duty on paper was abolished. Round about 1870 to 1880 two important and revolutionary changes appear. The first is the introduction of raw wood dust from the grindstone as a papermaking material of great cheapness, a material now employed in vast quantities in the manufacture of "news" paper and the second is the use for the first time of white mineral substances like china clay as a filling or weighting material. These two processes have between them changed paper from a comparatively costly article to one of the cheapest manufactured products.

Since this time the manufacture of paper in Europe has developed in tremendous strides making very great demands upon the available supplies of raw materials. Rags instead of being the ordinary and usual basis of common papers are now confined to the best grades of white paper only. The material now used in by far the greatest proportion in modern paper is wood pulp, either in its raw state or after chemical treatment. The morning paper on your breakfast table is little more than a fabric of deal sawdust. So great is the drain on the timber supply of the world for this purpose that there is grave danger of these supplies giving out. One authority computes that for only one edition of a cheap daily newspaper with a circulation of 200 thousand copies 200 trees must be cut down each of an average height of 50 ft. and of an average diameter 5 ft. from the ground of 8 to 9 in.

In recent years the entire known vegetable kingdom has been ransacked for material to supply the wastage and in preparation for coming shortage. Such widely different materials as the common nettle and peat have been proposed, and a company was even formed in France some years ago to exploit for this purpose the undigested refuse of cellulose found in the stomachs of cattle at the slaughterhouse. At the present moment, however, timber is still available in sufficient quantity to hold its own in first cost with all comers when the comparative cost of collection, transport and treatment are taken into account. How long this state of affairs will continue is another matter.

I feel I ought not to finish this talk without a reference to the multifarious uses of paper products in our present day lives. Paper collars and serviettes are now so common as to elicit no surprise. Less well known is the employment of paper for making building boards, railway coach wheels, machine gears, and to replace metal in certain parts in automobile practice. In the Russo-Japanese War the Japanese relied partly on paper clothing to keep their armies warm, whilst in the Great European War paper waders were employed in our trenches. The spinning of yarn from paper strips was invented in 1895 and paper string is now a fairly common commodity. The artificial silk stockings now so popular are produced from wood pulp and are substantially of the same composition as paper, while brown paper is but too commonly met with as a substitute for leather in boots.

THE tax on playing cards in Germany has been increased to 10.000 marks per pack as from August 1st.

Paper Trade of Japan.

Position of British Suppliers.

Paper and pulp play a considerable part in the industrial and commercial life of Japan, and British suppliers are responsible for a big share of the paper imported.

A report on the commercial, industrial and financial situation in Japan, published for the Department of Overseas Trade by H.M. Stationery Office, contains several references to the pulp and paper market of the country. Covering the year 1922 and up to June 30th, 1923, the report is prepared by Sir E. T. F. Crowe, Commercial Counsellor, and Mr. H. A. F. Horne, Commercial Secretary, H.M. Embassy, Tokyo, and is obtainable at the price of 2s. 2d., post free.

Paper and Pulp Imports.

Under the heading of paper, the following paragraph appears: "Notwithstanding the great development in the Japanese paper industry, imports of paper remained at a high figure. The trade was more or less evenly divided between the four leading producing countries, but America, which in 1920 had over 50 per cent. of the trade, has fallen to fourth place in the list. The following are the shares of the leading countries: Sweden, 4,656,000 yen; United Kingdom, 4,486,000; Germany, 3,846,000; United States, 3,411,000.

In pulp the Scandinavian countries have once more regained their position; Canada, which in 1921 shipped 21,000 out of 40,000 tons, in 1922 only exported 16,000 out of 66,000 tons.

The business in books—German, British and American—continues to grow year by year, and will be worth about three million yen in 1923.

An appendix gives detailed figures. From these we note that imports of paper in 1922 reached a value of 18,965,000 yen, and in the period January-March, this year, 2,803,000 yen. Pulp for papermaking was imported in 1922 to the extent of 1,115,000 piculs (11,755,000 yen) and in the first three months of this year the quantity was 108,000 piculs, of the value of 1,003,000 yen.

Exports of paper from Japan in 1922 were of the value of 16,127,000 yen, the figure for January-March this year being 3,579,000 yen.

Chemicals and Artificial Silk.

It is interesting to note also the extent of Japan's trade in chemicals. As usual, the most important business in heavy chemicals has been done in soda ash and caustic soda, the total amount imported in 1922 being 113,000 tons, valued at 9,000,000 yen. The United Kingdom has recovered the greater part of this trade, although there is still considerable competition from America and Africa and prices have been maintained at a low figure on account of this competition. Rosin, which had been very much overdone in 1920, is being imported again in 1923 as the stocks have gone into consumption.

Another product which has some bearing on the pulp and paper industry is artificial silk, a matter which, we are told, constitutes a very real danger to Japan. Its consumption is growing in America by leaps and bounds and its quality and strength have much improved.

Norwegian Paper and Pulp.

Produce and manufactured goods exchanged between Norway and the United Kingdom in 1921, the last year for which complete Norwegian figures are available, show that in the external trade of Norway this country had the largest share. Of a total importation valued at 1,463,550,000 kr., the United Kingdom supplied material and merchandise to the value of 376,693,000 kr., while, in turn, this country received from Norway products to the value of 175,077,000 kr. of a total export trade amounting to 637,966,000 kr. Norway's exports last year of wood pulp, both chemical and mechanical, were in excess to the extent of about 50 per cent. of what they were in the preceding year. Regarding Norwegian paper exports it is shown that the United Kingdom last year was a better market for this produce than in any other year since the war.

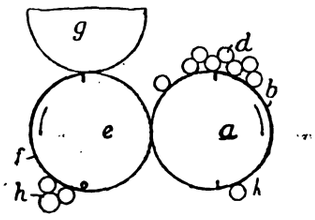
New Inventions

Offset Printing.

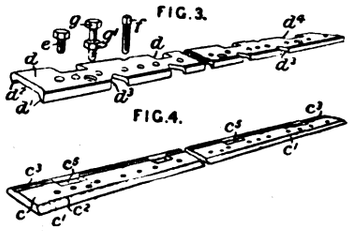
A rotary lithographic machine for printing direct or offset impressions, or for perfecting a sheet with a direct impression on one side and an offset impression on the other side, as patented by Messrs. A. B. Evans and R. P. Payne, comprises an impression or offset cylinder *b* fitted with two sets of grippers *d*, *g* arranged in front of surfaces b^1, b^2 which may be fitted with offset or impression surfaces. The cylinder *b* coacts with a plate cylinder *a*, of equal diameter, which is fitted with one or two printing plates, and with a cylinder *c* of half diameter which delivers the printed sheets, and in the case of offset printing, acts also as an impression cylinder. For direct



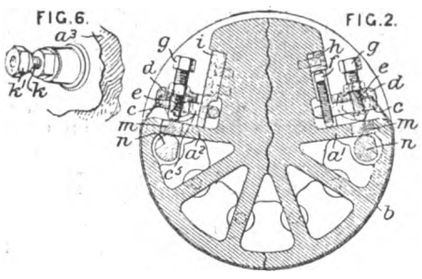
printing, the sheets are fed from a table *e* to the grippers *d*, and the surface b^1 is fitted with an impression surface and only one printing plate used on cylinder *a*. For offset printing the sheets are fed to the grippers *g*, and an offset blanket used on the surface b^1. The surface b^2 carries the sheets without impression past the cylinder *a*, and transfers them to cylinder *c* which carries them for one revolution without impression, and then prints in conjunction with the surface b^1. For printing both direct and offset impressions, the surface b^2 is fitted with an impression surface, and a direct impression obtained before the offset one is effected in the manner described for single offset printing. By employing a cylinder *a* of half the diameter of cylinder *b* a direct impression may be perfected by an offset one of the same design to print transparencies. In each case one sheet is printed for each revolution of the cylinder *b*.

Tripping arrangements.—The cylinder *b* is mounted in eccentric bearings *m* which are operable by cam-and-lever mechanism, under the control of the operator, to trip the cylinder *b* as desired. The movement of the eccentrics *m* is transferred by a link *r* to eccentrics *t* in which the cylinder *c* is mounted, so that the cylinders *b*, *c*, are tripped simultaneously.

Offset Damping Apparatus.



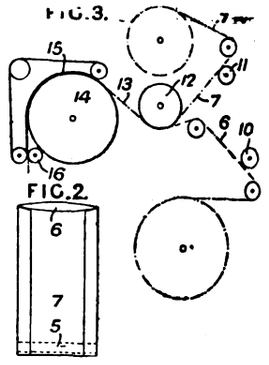
In this invention, patented by Mr. A. B. Evans, a rotary offset lithographic printing machine of the kind in which a printing cylinder *a* and offset cylinder *e* coact with an impression cylinder *g* is constructed, so as to allow of ready access to the design cylinder, with a damping apparatus *h* which is



arranged in contact with the offset cylinder *e*, so that the printing surface receives its water from the offset surface *f*. Alternatively, a whole or a part of the damping apparatus may be arranged as shown at *k* to act on the printing surface *b* after it has received ink from the apparatus *d*.

Securing Printing Plates.

In an invention patented by the American Bank Note Co., mechanism provided by clamping a flexible metal printing-plate on to its cylinder of the kind in which the ends of the plate are gripped between pairs of bars arranged within recesses in the cylinder, and so mounted as to permit the plate to be adjusted axially, circumferentially, and angularly of



the cylinder, the clamping-bars are secured within the recesses in the cylinder by a series of retaining plates spaced apart between the ends of the bars. Fig. 2 shows a section of the cylinder in two different planes and Figs. 3 and 4 show the clamp bars. The clamping mechanisms at both sides of the plate *b* are similar and each comprises a lower bar *c*, having a bevelled edge c^1 and a straight shoulder c^2, and an upper bar *d* pivoted to the bar *c* by means of a rib d^2 engaging groove c^3 and secured thereto by bolts *e*. The bar *d* has a tongue d^1 co-operating with the edge c^1 and a number of recesses d^3 to facilitate the positioning of the plate. The bars are held by plates *i* secured to the cylinder and passing through gaps d^4 in the bars *d* and openings c^5 of the bars *c*, the back edge of the openings c^5 being rounded to permit a pivotal movement of the bars upon the plates *i*. The bars are spaced from the shoulders a^1, a^2 of the cylinder by bolts *g* screwed into the bar *c* and provided with lock-nuts g^1, and by screws *f* screwed through the bar *c* in alinement with the recesses c^4 and having rounded ends engaging the shoulders a^1 and a block *h* fixed to the cylinder. The bolts *g* engage bars *m* which are held in the plane of the shoulders by cam-bars *n* but which may be depressed to loosen the plate *b* by turning the cam-bars *n* by a spanner applied to its squared ends. Circumferential adjustment of the plate *b* is effected by the bolts *g* either alone or in conjunction with the screws *f* and skewing of the plate may be effected by adjustment of the bolts and screws at one end only of the cylinder. Axial adjustment of the plate is obtained by means of screws or studs *k*, Fig. 6, secured to the end plates a^3 of the cylinder and carrying nuts k^1 engaging the ends of the clamp bars *c*, *d*.

Paper Bags.

A device for making paper bags has been patented in the name of Mr. C. W. Hartmann. In flat bags which are formed by the lengthwise folding of one or both of the component pieces 6, 7, Fig. 2, the bottom, which is formed by pasting together the two components by a cross paste stripe 5, is cut some distance below the stripe.

The edges of the web of paper 6, Fig. 3, are pasted continuously by a pasting roll 10, and cross stripes of paste are applied to the web 7 at suitable intervals by a roll 11. The webs are united at the roller 12 and, after folding is carried out by known mechanism at 13, the webs pass between a roll 14 and an endless pressure belt 15. The actuation of the severing device 16 is timed so that the cut is below the cross stripe.

Zinc and Copper Process Plates

Used by all the Leading Newspaper and Process Houses in the British Empire. Supplied in all Gauges and Sizes. Also High Grade Zinc and Copper Plates for Etching, Engraving, Mezzotint, Aquatint, and Artists' Requirements.

THE

THOMPSON TYPE, LEAD & RULE CASTER

Reliability of a typecaster consists of the high quality of its product at a cost low enough to make non-distribution economical.

Thompson quality is a standard of accuracy not surpassed even by typefounders.

Simple, complete and compact, using Linotype, Intertype and its own matrices interchangeably, the Thompson produces more type than any other typecaster on the market and equals the out-put of two of some other makes.

Type in all languages from 5 to 48 point, leads, slugs and rule 2 to 12 point, accurate in every detail, are produced on the Thompson Type, Lead and Rule Caster.

THOMPSON TYPE MACHINE CO. 223, W. Erie St., Chicago, Ill., U.S.A.

Gold Inks

(LETTERPRESS)

IF you have never yet tried Gold (Letterpress) Inks or are familiar only with those hitherto obtainable, Lorilleux and Bolton's gold inks will be a revelation to you.

No modern printer keen on cutting costs and speeding up production can possibly afford to ignore the handiness and economy they offer.

The following points show the great superiority of Lorilleux & Bolton's gold inks:—

1. They do not clog or harden on the rollers.
2. Need no specially skilled operator.
3. Are suitable for either platen or cylinder machines.
4. The machines can be run at normal speed.
5. Retain their brilliance for long periods.
6. Print the type thoroughly and heavy solids without difficulty.

Available in light and dark shades of gold as well as silver.

Write for specimen prints and generous sample tin to-day.

THE FUTURE OF SOUTH AFRICA

THE strong development and progress shown by South Africa, even during the depression of 1922, indicates in no uncertain fashion the measure of prosperity that country will enjoy in more normal times.

The trade outlook for the Union of South Africa in 1923 is extremely encouraging at the present moment, and the attitude of all in that wonderful country—from the Premier (The Hon. Gen. Smuts) down to the smallest Printer—is one of well-founded optimism.

Supply houses catering to the Allied Trades anxious to develop the South African market will be sent a post-free copy of

THE SOUTH AFRICAN PRINTER AND STATIONER

the only Journal printed in South Africa catering to the Printing Trade. Issued monthly.

Stereotyping as a Metallurgical Operation.

By A. H. MUNDEY and JOHN CARTLAND, M.C., M.Sc.

The practice of stereotying is essentially a process in the craft of printing, but it is none the less a metallurgical operation, and as such deserves the help and recognition of metallurgists. The assistance of members of the Institute of Metals in the problems of this industry will be welcomed. The magnitude and importance of the craft may be judged by the fact that for the production of one single London issue of a great daily newspaper no less than 40 tons of stereotype metal is cast into plates nightly.

Stereotype, as understood by the printer, is a fixed type in the form of a plate, upon the surface of which is cast a reproduction of the faces of all the type which has been set up by the compositor, together with any pictorial matter which is to be printed, either in black and white, as in the ordinary newspaper, or in any selected colouring, as in the splendid coloured prints which are now produced.

The earliest known worker is said to have been van der Meer, who early in the eighteenth century soldered type together, thus forming a solid block or slab. Later, in 1750–51, William Ged, a goldsmith of Edinburg, invented the process of stereotyping, or casting the stereo plates in a plaster of Paris mould.

Plaster has been almost entirely superseded by a material of the nature of papier maché, called "flong," invented by Wilson in 1823. It is composed of many sheets of tissue paper carefully pasted together, backed by unsized cartridge paper, and faced with a special paste. The process may be described very briefly as follows:—

The forme or page of type or illustration is laid face uppermost on an iron table, the face lightly oiled; a sheet of flong is placed upon it covered with a damp linen rag. The flong is either beaten or mangled into the face of the type, and is dried in position under a hot press or in a rotary drier. The papier maché sheet, having upon one surface a correct impression in reverse of the type face, is placed in a heated iron casting box, either flat or half cylinder in form, according to whether the plates are required to be flat for use on flat-bed printing machines, or curved for use on the cylinders of the rotary presses. Strips of iron are placed around three sides of the papier maché mould, to control the thickness of the plate and to retain the metal; the top or cover plate is secured firmly, the metal poured in, and the casting or plate, after trimming, is ready for use on the printing press. The interior surfaces of curved plates are ribbed, reducing the weight and providing a larger cooling surface.

Paper presented at Manchester last week at a meeting of the Institute of Metals.

The pouring of the metal requires considerable skill, in order to avoid entrapping air and to ensure a perfectly sound casting. The boxes are provided with water jackets in order to ensure sufficiently rapid cooling, and in many cases the metal is delivered into the casting box by means of a pump.

The great advance in this work is the production of the plates at a rapid rate—about two per minute—in the auto-plate machines. In these machines the plates are cast in the horizontal position, the convex side being downwards, the air in the casting box being effectively swept out by the flow of metal. The matrix is placed in the casting box, molten metal is pumped in, a head of fluid metal under moderate pressure being maintained in order to "feed" the casting whilst cooling. When the casting is solid it is pushed along, and is planed or trimmed, and finally the finished plate is delivered at the other end of the machine, ready for inspection and delivery to the press room. There is very little manipulation, but of necessity the control of temperatures, the condition of the matrix, and the adjustment and management of the machines call for the highest skill and experience.

A still later design of casting machine is the Junior Auto-plate. The melting pot contains from 5 to 8 tons of metal, and is fitted with a stirrer on the screw propeller principle, metal for use being drawn from the lower portion of the container. The casting box is vertical, and the matrix lines one curved portion of it, the mandrel or core being formed with rings or serrations to produce the internal ribs of the plate. Both box and core are water cooled. The metal is introduced into the top of the casting box by means of a hollow arm or conveyer, fed by a simple force pump, hand operated. Carefully arranged vents for the ejection of the air are provided, and a large head of metal is cast on each plate, which acts momentarily as a feeder and promotes soundness. This head, as it would be generally named by an engineer-foundryman, is somewhat perversely described as the "tail"; it is removed by an automatic cutter in the second operation. When the casting is completed, water at 20 to 25 lb. per square inch pressure is admitted to the casting box and mandrel through a number of holes in a hollow cylinder called the "rose," and also a simple water jacket. It is probably in these operations that the chief metallurgical difficulties arise. If the cooling be too rapid, a thin skin of metal solidifies over unsound parts, and on the complete solidification the surface is slightly drawn down; this defect produces what are termed "sinks," which, however slight, result in uneven patches upon the printed page.

Slight unevenness of cooling also causes distortion of the plate, so that when leaving the casting-box it is not truly cylindrical; a distortion of 0·01 in. is sufficient to cause endless trouble when the plates are fitted upon the cylinder of the rotary press, as they will not take an even seating, and thus too great a pressure is exerted upon the paper, injuring it and making the printing uneven and faulty. The authors have recently had experience of this feature in an aggravated form. The plates appeared to be perfect, the alloy was accurate in every particular, yet they would not fit exactly, although no errors were observable either in the mechanism or the manipulation. There can be no doubt that the fault was in uneven cooling. Had the metal been of a low grade and soft, it would have been sufficiently plastic to conform to the cylinder, but as it was hard and resilient it did not do so.

The temperature of casting is a most important matter; it varies from 265 degs. C. to 305 degs. C., according to the composition of the metal and the skill of the operator. As the alloys employed commence to deposit solid constituents at about 250 degs. C., it will be appreciated that much skill and extreme rapidity of action is necessary when the pouring temperature is in the neighbourhood of 265 degs. Actually some operators work their metal when it is already depositing the soft solid constituents and the metal is of the consistency of thin gruel.

The composition and properties of the alloys used were given by the authors in a former paper. They vary according to the character of work required, the tin content being from 5 per cent. to 10 per cent., antimony 15 per cent. to 19 per cent., and the remainder lead. Sometimes a little copper is added. This increases the hardness, but, at the same time, the difficulties in melting and casting are greater, as a tin-copper constituent commences to fall out of solution at about 270 degs. C., and an antimony-copper compound at a somewhat higher temperature. We are able by courtesy of Messrs. Linotype and Machinery Limited to illustrate the Junior Autoplate casting machine overleaf.

Probably the latest development in the automatic casting of stereotype plates is by means of the "Winkler" casting machines, the invention of a Swiss engineer. The authors are indebted to Mr. W. J. Light, the English director of Messrs. Winkler, Fallert and Cie., S.A., Berne, for the details.

It is designed to cast the plates and at the same time to dispense with the "tails," the use of pumps, the necessity of trimming and shaving, and the preheating of the casting-box. The casting-box is connected directly with the melting-pot, the metal entering by

L&M

LITHO ROTARIES

THE PRESSES WITH SPECIAL FEATURES.

THESE LITHO ROTARIES have now been in use for many years, and have fully demonstrated their value to practical printers on all classes of work. When designing and developing these presses, our engineering experts collaborated with practical printers in order to give to the lithographic trade the best machines for direct and offset printing.

We specially invite those houses who at present are engaged solely in letterpress printing, and are considering the possibilities of litho machinery in their own business, particularly offset printing, to permit us to advise them in the matter. We shall be pleased to arrange for one of our experts to discuss the matter with any printer who writes us accordingly.

General printers who intend to extend their lithographic departments by installing Litho Rotary Presses should send for full details of the

LINOTYPE AND MACHINERY LIMITED

9 KINGSWAY, LONDON, W.C.2.

gravity through a long slit, which is opened and closed by a very ingenious valve in the form of a rod with twin bevels the whole length of the plate; the operation of closing severs the casting from the supply of metal, the "feeding" during solidification is maintained from the full pot, under the natural pressure of the head of metal.

The melting-pot is wedge-shaped, and the mouthpiece or slit is at its lowest portion. It is insulated by means of firebrick, asbestos, and siliceous marl, and the temperature is maintained for a long time after the source of heat is shut off. The surface of the metal is well protected, and is maintained in as non-oxidising an atmosphere as possible. The plate mould is water-cooled, and also is the core or mandrel, the control of water admission being automatic. The cock cannot be opened until the casting-box is effectively closed, thus avoiding splashing of hot metal.

The heating is by coal or coke, by gas or by electrical means, or by a combination of these. The electrical method of heating is greatly favoured, as it lends itself so completely to automatic control. The heating elements are immersed in the metal, and all external application of heat to the pot or container may be avoided, thus eliminating the danger of cracked pots to a very large extent. Effective thermostats are fitted. An electrically-wound clock, which is set to any desired time, switches on the current and starts the heating operation, so that the metal may be thoroughly molten and ready when the operators commence work. This is an attractive feature of this equipment.

The practical metallurgical problems in the work of stereotyping are:

The provision of an alloy which shall be capable of being melted and cast at a reasonably low temperature, in order that the papier-mâché flong shall not be charred. The casting must be absolutely sharp in all its details, even to the half-tones. The metal is required to be hard enough to withstand considerable pressure, and also abrasion, the latter being caused by the paper passing rapidly over it. It must also be sufficiently tough and strong to avoid the slightest danger of fracture due to shock, or to inertia stresses. Finally, the metal must be reasonable in price.

The fineness of face to the casting is a quality which is difficult to describe or define, but it appears largely to depend upon the amount of tin present proportional to the antimony. The tin-antimony crystals which separate on cooling must be fine, regular and evenly spaced, or the desired result is not attained. The antimony crystal is evidently much more brittle than the tin-antimony crystal of similar cuboid form.

Increases of 1 per cent. of either antimony or tin, or of both, alter the behaviour of the alloy in working very considerably; variations to a larger extent modify it proportionately.

For absolute ease in manipulation an alloy as near the eutectic as possible is desired—in fact, this is colloquially termed the "lazy man's metal"; but although it is easy in working, this is its only possible virtue, as it does not wear well, nor does it give either perfect definition or face.

In some cases the plates are nickel-plated, by electro-deposition, in order to give a harder and more durable surface. This is, however, by no means universal, nor is it quite free from disadvantages. On remelting the plates, the nickel facing floats to the top

of the metal bath in thin scales, and provided the temperature is not unduly raised no harm results, as the nickel is removed by skimming. But if, by any means, it becomes dissolved, the tin-nickel compound, which has a very high melting point, becomes an additional source of trouble. This also obtains in varying measure with other foreign metals; the chief enemies being zinc and aluminium, as these in falling out of solution collect around them large quantities of tin-antimony crystals in spongy masses.

It is observed that new alloys do not work so smoothly through casting machines as those which have been melted repeatedly. This feature is also remarked in ordinary foundry practice, but these difficulties are accentuated by the great rapidity of the operations and the narrow working limits in temperature necessary. The reason for this difficulty is not evident. At the authors' works all alloys are melted at least four times to ensure as complete solution and homogeneity as possible. Loss of tin and antimony seems to offer a possible explanation, but this has been thoroughly explored and disposed of. It is therefore customary for printers regularly to mix new and previously used metals in charging their machines.

It may appear to some metallurgists, who are unfamiliar with the details of the work in a printing office, that the necessity for high refinement of manipulation, accurate temperature control, correct proportion and purity of alloys, etc., have been over-emphasised. But it is pointed out that a duty is demanded from these castings which is quite unlike any other. Their utility depends upon the high finish, in all respects, of the face or skin. It must be as accurate and perfect in definition as a die-casting which is produced in a metal mould, and conditions of production are such as preclude any trimming, polishing, or finishing of the face or working part whatever. The work must proceed with astonishing rapidity, and a hitch or breakdown in the cycle of operations must be made as nearly impossible as human power can devise. A delay of even half-an-hour in the issue of an important newspaper is an occurrence practically unheard of. Finally, the product of the casting, in the form of the printed page, is subjected to the scrutiny of not merely a few interested and skilled official inspectors, but of a public consisting of many hundreds of thousands of persons only too ready to criticise.

The authors desire to thank Mr. John Fry, of Fry's Metal Foundry, for facilities in connection with this short paper, and for permission to submit it.

The Junior Autoplate Casting Machine.

The German Printing Trade.

A Critical Juncture Reached.

The news received last week that the town of Leipzig had declared itself bankrupt brings home in startling fashion the amazing economic condition to which German industries, including the printing industry, have been reduced. Leipzig is the centre of the German printing industry and the insolvency of the town is doubtless not unconnected with the economic crisis in which German printers now find themselves.

Surveying book-printing and publishing conditions in Germany, the *Economic Review* points out that a communication from Leipzig to the *Vossische Zeitung* (August 23rd) states that the new book printing tariff, which fixes the weekly wage for the week August 17th–24th at 36.5 million marks, places the entire life of the book and printing trade in danger of extinction. The blow struck by the fixing of this wage at a rate higher than gold parity will be primarily felt in Leipzig, the home of the printing industry. The German publishing world will be totally unable to place contracts if this tariff is enforced. What this would mean for Leipzig is only too clear, for most of its life is bound up with the printing trade. As a matter of fact, the publishers of scientific works have already decided to print no new books, as they could find no market for them over world market prices. Other publishers will scarcely be able to avoid a similar decision. The crisis was already visible at the beginning of the year, when the publishers of the famous "Meyer's Konversations Lexikon" decided that they could not continue publication, as it would cost too much. The crisis was avoidable so long as the key number employed by the book dealers was not lower than the book printer's wage. This key number—which at time of writing is 700,000—is, when one considers the high price of paper, calculated with a very narrow margin of profit. When the book printer's tariff suddenly attained a multiplicator of 1,200,000, the dealers' key number was obliged to follow suit, but the book purchasers cannot meet the prices demanded. If the book trade decides to continue business with its existing stocks alone, it is a poor prospect for authors and for the German book market in general.

It is now announced that the key number of the German book trade is fixed at one million, in consequence of the increase of the book printers' tariff to two million times the pre-war rate.

A message from Berlin to the *Frankfurter Zeitung* (August 26th) states that as a result of official arbitration, the Central German book printers, including the newspaper printers, came to an agreement, as regards the wage tariff for the Magdeburg area, and the dismissal notices to their employees were withdrawn. Throughout Central Germany this trade has dismissed their workers, on the grounds that they can no longer afford to run their businesses at the present rate of wages. It is hoped that as a result of the Magdeburg settlement, dismissals in the other areas will be revoked.

A report on the various paper working industries in *Deutsch Allgemeine Zeitung* (Aug. 26th) gives a practically uniform picture of conditions in the coloured paper industry, the chromo paper and pasteboard industries, and other allied industries. All complain of a falling off in foreign trade, difficulty in procuring raw materials, increasing recourse to short time working and dismissals, and the tendency of prices to rise over the gold parity.

UNEMPLOYMENT.—Statistics concerning unemployment in July show that in paper and paper board making there were 3,319 men, 1,044 women, and 249 juveniles (a total of 4,612) out of work, an increase of 734 compared with June 25th. In the section of the industry relating to cardboard boxes, paper bags and stationery, the total unemployment was 4,228, comprising 1,135 men, 2,767 females, and 326 juveniles, an increase of 134. Printing, publishing and bookbinding accounted for 12,873 unemployed — 8,255 men, 3,887 women and 731 juveniles—a decrease in the total of 37. In wall papermaking and paper staining there were 210 unemployed, a decrease of 42, and in stationery and typewriter requisites (not paper), 259, an increase of 26.

— SIMPLICITY —

The Keynote of the WINKLER Automatic Feeder.

Simplicity also means efficiency. Simplicity permits quantity production at moderate cost. The WINKLER Feeder, through its simplicity and absence of confusing adjustments has set a new standard of value, combining the utmost efficiency and reliability with a remarkably low price. Standard parts are used exclusively for the construction.

SWISS MANUFACTURE.

SEPARATION of sheets by suction and blast.

Length of printing machine is not increased and access not impaired.

Feeds to register any stock from tissue to board.

Works in unison with the machine, and at any speed up to the maximum guaranteed by the press makers.

Rapid change of jobs, and therefore suitable for short runs.

No tapes or friction wheels, and therefore no marring of colours or setting-off when working colours or backing up.

The blast of air frees the sheet from dust and fluff before it is fed.

Adaptable to any type and size of sheet fed press; if desired, with a Stacking Arrangement.

Write to-day for Prospectus to the Sole Agents—

Trade Notes.

FIRE IN GLASGOW.—An alarming outbreak of fire occurred on Saturday afternoon in the printing and stationery premises of Mr. James Hart, 43, Mitchell-street. Several fire brigade detachments rendered service, but owing to the density of the smoke great difficulty was experienced in reaching the seat of the fire. Considerable damage is reported to have been done to the top floor and roof, while the second and third floors of the building suffered severely from water, the damage being roughly estimated at £7,000.

A FIRE broke out early on Sunday morning on the premises of the *Daily News* in Bouverie-street, E.C., and the photographic-room on the top floor was burnt out. Part of the roof was destroyed, and other rooms on the same floor were damaged.

THERE was a further sitting on Tuesday of the Joint Committee of the Federation of Master Printers and the National Association of Wholesale Stationers and Paper Merchants, in continuation of the discussion of the question of "direct trading" in paper.

A LECTURE on "Type Composition of Oriental Languages" is to be the principal item at a meeting of the Association of Master Printers of East and North-East London, to be held on Tuesday next at the Langthorne Restaurant, Broadway, Stratford. The lecturer is Mr. Burns, of Messrs. Burns, Bailie and Co., Braille printers and oriental language specialists, Manor Park, E.12.

PRINTERS' WIMBLEDON MEETING. — The South-East and South-West London Master Printers' Associations, together with the Thames Valley Association, are arranging a united district rally on Tuesday, October 2nd. The meeting is to be held at Johnston's Restaurant, 6, The Broadway, Wimbledon, S.W. (opposite Wimbledon Station), a conversazione and tea taking place at 4 p.m., followed by addresses and discussion at 5.

NORTH LONDON Master Printers are to meet on October 9th, when Mr. George Eaton Hart and Mr. John D. Wise are to be the principal speakers. Details of the meeting will be announced later.

AS A sequel to many complaints of petty thefts at the headquarters of the Federation of Master Printers, a young charwoman who had been working on the premises was last week charged at the Guildhall with breaking open a drawer in an office at 24, Holborn, with intent to steal. Detectives set a trap, and later caught the accused on the premises, and she admitted opening the drawer. She was remanded.

ORPHAN FUND FLAG DAY.—Wherever the position of the Printers' War Orphan Fund, instituted by the Printers' Pension Corporation, has been discussed, sympathy has been expressed, the whole industry being extremely anxious that the grants should be continued to the 900 children until each shall have reached the age of 14. Subscriptions are coming in from master printers' associations, individual firms, trade unions and individual employees, but it is thought that an effort should be made to ensure a further opportunity being given to all employers and employees in the printing and allied trades to contribute. The Organisation Committee of the Joint Industrial Council has, therefore, decided to organise a Trade Flag Day on the first pay-day in November next, and is sending to every employer in the printing and newspaper offices of the United Kingdom a letter and poster for exhibition in the works. In the larger establishments it is suggested that, if possible, a meeting of the employees be called, the object of the appeal explained, and a responsible person appointed to organise the collection inside the works on the date fixed. No flags are to be sold outside any printing works.

THE *Glasgow Evening News* on Monday celebrated its jubilee, and to mark the occasion a special supplement was issued, containing descriptive and illustrated articles dealing with the progress made during the past 50 years.

AT the Old Bailey this week Richard Grosvenor, age 37, canvasser, and William Blackburn, age 35, clerk, were found guilty on a charge of obtaining money by false pretences, collecting money from tradespeople for a directory which was never printed. Sentences of nine and six months in the second division were passed.

THE sudden death of Mr. Arthur Bleach Williams occurred on September 4th. Mr. Williams was struck down with heart failure while walking along the Marine Parade, Worthing. He carried on business as a printer and bookbinder for 26 years at the Marmion Printing Works, Lavender Hill, Battersea, until 1911, when he disposed of the business, and settled in British Columbia with two of his sons, the younger of whom now owns and edits the *Cranbrook Herald*. In 1910 he returned again to the Old Country, intending to retire.

THE death took place at his brother's house, Stevenson, suddenly, on the 11th inst., of Mr. Peter Ross, stationer, etc., Killin.

THE late Mr. Herbert Vivian Beedell, of the Homestead, Hendon-lane, Finchley, N., printer, who died on August 9th, aged 53, left £30,730.

NEW YORK STRIKE.—Owing to a strike of printers, none of the big daily newspapers appeared in New York on Tuesday morning. The men struck on the previous midnight on a question of working hours. The publishers, after holding a conference, decided to pool their resources, and run off a common edition of six or eight newspapers bearing the names of all the newspapers affected by the strike.

A NEATLY printed folder reaches us from the Camberwell School of Arts and Crafts (L.C.C.) announcing the new session's Artistic Typography Classes for compositors and machine minders. Bookbinding, drawing and lithographic drawing are other subjects taught. The instructors are Messrs. W. H. Amery, J. Acton, H. G. Wicks, J. W. Walls, P. J. Smith, S. W. Hayter, and G. F. Holland.

THE Northampton Polytechnic Institute, Clerkenwell, has issued its pamphlet of "Announcements" for the session 1923-24. On this occasion the new issue deals with the evening work only. The well-known work of the day section of the Institute will be practically the same as last session, there being only small changes in details of syllabuses which can be made as the work develops. Instruction in electrotyping and stereotyping and in metallurgy is included as usual. The classes for the day courses commence on Monday, October 1st, and those for the evening courses on Monday, September 24th. Enrolments for the latter commenced on Monday, 17th inst.

Trade Union Matters.

TYPOGRAPHICAL ASSOCIATION AND TIME DOCKETS.—The Executive Council of the Typographical Association have had under consideration a communication from the secretary of the Birmingham branch enclosing a specimen of a docket which had been introduced into an office in Birmingham and asking if the Council had any objection to the use of such dockets. The Council, after considering the matter, have informed the Birmingham secretary that they are not agreeable to the introduction of the docket.

TEN members of the Typographical Association were in August placed on benefit under the Association's superannuation and incapacity arrangements, the ages ranging from 56 to 69 years. A Birmingham member aged 79 has since applied for benefit.

THE membership of the Colchester branch of the T. A. has increased from 56 in June last to 150 members on the books at present.

From the London Gazette.

PARTNERSHIP DISSOLVED.

THE BANKRUPTCY ACT, 1914.
RECEIVING ORDERS.

Mary L. Flint (widow), of 9, West Halkin-street, St. George, Hanover-square, London, carrying on business under the style of Lovegrove and Flint, stationer.

J. Harris, 4, Beecroft-grove, Leeds, carrying on business under the name of Jack Harris, 4, Beecroft-grove, Leeds, and at Foreshore, Scarborough, Yorks, stationer.

The Docket Question Debated.

Interesting Meeting of the L.S.C. Jobbing Guild.

A meeting of unusual character took place on Wednesday of last week, when a joint gathering of workpeople and employers in the printing industry engaged in free and frank discussion of the burning question of the docket in the printing and allied trades. Perhaps no very definite conclusions were arrived at, but such discussions undoubtedly serve to enlighten all parties, and so to facilitate the adoption of methods generally acceptable.

The meeting, which stands to the credit of the London Society of Compositors' Jobbing Guild, was held in the Board Room of the L.S.C., St. Bride-street. The chair was taken by Mr. Geo. Eaton Hart, and an address was given by Mr. Ernest Pheby on "The Place of the Docket in the Costing System." Mr. T. E. Naylor (secretary of the L.S.C.) and his brother, Mr. H. Naylor (secretary of the L.S.C. Jobbing Guild), were amongst the many trade unionists present, whilst the attendance on the employers' side included Messrs. A. E. Goodwin (secretary, Federation of Master Printers), Mr. W. Whyte (secretary, L.M.P.A.), Mr. A. Williamson (secretary, Federation Costing Committee), and Messrs. J. D. Wise, E. W. Carter, C. H. Lea, J. W. Garner, P. Walmsley and J. Griffiths.

Mr. Pheby delivered an able address serving well to focus attention upon the need for accurate time recording such as the docket attempts to obtain, and the difficulties associated with the matter. In tracing the connection between the docket figures and the weekly summaries and yearly cost totals, the speaker employed very useful diagrams to make clear various points, such, for instance, as how the different forms used in the Costing System fit into their places in building up the hourly rate. As to the desirability of the docket, Mr. Pheby himself took a moderate view, and, whilst admitting the need for such means of time-recording, urged the need of improvements in the form of dockets used.

The discussion was of a very varied character, pros and cons being vigorously debated on all sides but the outcome was distinctly promising for the future of the Costing System, a notable feature being the way in which the younger trade unionists present recognised the value of scientific cost-finding and the need for the docket in relation thereto.

TO-MORROW, Friday, is the date of the annual meeting and presentation of prizes of the Stationers' Company and Printing Industry Technical Board. The meeting takes place at Stationers' Hall at 6.30 p.m. There will be a number of prominent representatives of the printing industry on the platform, and the prizes are to be presented by Mrs. Wilton Phipps, J.P. (chairman of the London County Council Education Committee), the chair being taken by the Master of the Stationers' Company, Mr. Edward P. Vacher, F.R.G.S.

DIVIDENDS AND REPORTS.

WINTERBOTTOM BOOK CLOTH CO. announces interim dividend of 1s. per share, tax free, on ordinary shares.

EDWARD LLOYD, LTD.—Edward Lloyd has declared interim dividend on Ordinary shares of 9d. per share, free of tax, payable Oct. 1st.

Y. TROTTER AND SON.—Accounts for past year show divisible balance of £16,092. Dividend of 5 per cent. on ordinary shares is proposed. For 1921–22 only preference dividend was paid.

NEW COMPANIES.

T. HARDING SON AND CO., LTD.—Capital £9,000, in £1 shares (4,000 preference and 5,000 ordinary); to adopt an agreement with Catherine A. Harding, Agnes H. Harding, H. W. Harding and S. L. Harding, for the acquisition of the business of printers, formerly carried on by W. L. Harding at Batheaston, Bath, and to carry on the same and the business of stationers, lithographers, paper bag and cardboard box-makers, etc. Private company. First directors: S. L. Harding, J. Frazer, H. W. Harding and W. J. E. Moreton. Registered office: Batheaston, Bath.

GARDEN CITY PRESS, LTD.—Capital £5,000, in £1 shares; printers, stationers, lithographers, photographers, typefounders, stereotypers, electrotypers, photographic printers, etc. Private company. Subscribers: J. W. Hyde and T. Booth. First directors: J. B. Morrell, A. J. Bonwick, and W. T. Bailey.

BRAY PRINTING CO., LTD.—Capital £5,000, in £1 shares; to acquire the business of Geo. Foster carried on by George Foster as The Golf Printing Co., together with the stock-in-trade, machinery, plant, etc., and to carry on the business of stationers, printers, etc. Private company. Subscribers: G. Foster and E. J. French. Registered office: 8, Nassau-street, Dublin.

BARHAM PRESS, LTD.—Capital £100, in £1 shares; printers, publishers, stationers, paper-makers, etc. Private company. First directors: P. E. C. Macnamara and G. E. Macnamara. Registered office: 65 and 66, Chancery-lane, W.C.

W. HART AND SON (SAFFRON WALDEN), LTD.—Capital £5,000, in £1 shares (350 7 per cent. cumulative preference and 4,650 ordinary); to take over the business of a printer, stationer, etc., carried on by W. E. Hart, at 18, King street, Saffron Walden, as Hart and Son, and to carry on the same and the business of newspaper proprietors and publishers, advertising agents, etc. Private company. Directors: W. E. Hart, Miss M. E. Hart and Miss B. M. Hart. Registered office: 18, King-street, Saffron Walden, Essex.

AULT AND WIBORG, LTD.—Capital £100, in £1 shares; to acquire and traffic in land, house and other property. Power is taken to carry on the business of manufacturers, importers and exporters of and dealers in lithographic printers', intaglio, die and other inks, dry colours and varnishes, bronze powders, typewriter ribbons and carbon paper, etc. Private company. First directors: L. A. Ault, C. I. Ferguson, F. B. Wiborg and A. J. A. Kennedy.

EXPRESS MACHINES, LTD.—Capital £2,000, in £1 shares; manufacturers or suppliers of office printing machinery, typewriters, duplicators, etc. Private company. Subscribers: F. P. Winterbotham and S. Powell. First directors: W. J. Bullimore and V. A. P. Stokes.

JACKSON AND FAUX, LTD.—Capital £600, in £1 shares; to acquire the business carried on at 5, Lord-street, Blackburn, as Jackson and Faux, and to carry on the business of booksellers, stationers, publishers, newspaper and magazine proprietors, art journalists, advertisement agents, etc. Private company. First directors: W. H. Jackson and W. A. Faux. Registered office: 5, Lord-street, Blackburn.

ASHBY SOAPS, LTD.—Capital £30,000, in £1 shares (15,000 7 per cent. "A" cumulative preference, 9,000 7 per cent. "B" preference and 6,000 ordinary; to adopt an agreement with C. H. Parsons, J. Oswell, H. E Rawlins and O. Ling, and to carry on the business of soap and candle makers, paper and varnish makers, etc. Private company. Directors: O. Ling, J. Oswell and C. H. Parsons. Registered office: 51, Wardwick, Derby.

ANGLO-EUROPEAN MANUFACTURERS' AGENTS, LTD.—Capital £100, in £1 shares; general merchants, factors, importers, exporters, shippers, manufacturers' agents, manufacturers of, and dealers in, paper, paper stock, cloth and other textile fabrics, etc. Private company. First directors: M. Jaffe and Mrs. R. Jaffe. Registered office: Bond-street House, 14, Clifford-street, Old Bond-street, W.1.

M. MARKSON, LTD.—Capital £5,000 in £1 shares (2,000 10 per cent. preference and 3,000 ordinary); importers, exporters, publishers, dealers in fancy goods, toys and stationery, etc. Private company. Directors: M. Markson, S. Osborne and A. Lemburger. Registered office: Orme-buildings, St. Mary's Parsonage, Manchester.

GALERIES HOWE, LTD.—Capital £1,000, in £1 shares; photographers, sellers of photographic apparatus, cameras and accessories, dealers in fancy goods and picture post cards at Cliftonville, Margate, Broadstairs, Ramsgate and district. Private company. First directors: E. T. Wetherill, T. E. Howe and D. L. Moulton.

COTTAMS (LEEDS), LTD.—Capital £1,000, in £1 shares; to acquire the business of a printer, designer, advertising agent and business organiser carried on at Pearl Chambers, Leeds, by T. B. Cottom, as "Cottams," and to carry on the business of manufacturers of, and agents for, office equipment, office furniture, printing machines, etc. Private company. First directors: T. B. Cottam, T. J. Hearn and M. Maclean. Registered office: Pearl Chambers, East Parade, Leeds.

G. W. ADVERTISING SERVICE, LTD.—Capital £2,500, in £1 shares (1,500 ordinary and 1,000 5 per cent. cumulative preference); to acquire the benefit of an agreement dated July 14th, 1923, between W. Greenhalgh and F. Wood of the one part, and H. Lee (for this company) of the other part, and to carry on the business of bill posters, artists, designers, photographers, etc. Private company. First directors: W. Greenhalgh and F. Wood. Registered office: 29A, Newport-street, Bolton.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

"ERA," LTD. (newspaper proprietors, etc., London).—Particulars filed of £15,000 debentures, authorised August 28th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital; the whole amount being now issued.

FORD PAPER WORKS (1923), LTD. (London).—Particulars filed of £60,000 debentures, authorised August 29th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital subject to an existing charge for £60,000; the whole amount being now issued.

E. AND F. N. SPON, LTD. (publishers, etc., London).—Satisfaction in full on August 27th, 1923, of charge dated July 22nd, 1920, securing all moneys due or to become due from the company to the London Joint City and Midland Bank.

E. AND F. N. SPON, LTD. (publishers, etc., London).—Satisfaction in full on August 27th, 1923, of debentures dated March 20th, 1922, securing £1,000.

LEONARD PARSONS, LTD. (publishers, etc., London). — Debenture dated August 29th, 1923, to secure £1,500, charged on the company's property, present and future, including uncalled capital. Holder: W. R. Cunliffe, 34, The Grove, Boltons, S.W.

WALTER H. ROGERS AND CO., LTD. (wholesale paper merchants, etc., London).—Particulars filed of £1,000 debentures authorised August 17th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £800.

Note-Printing in India.

Transfer from Bank of England and De La Rue's Recommended.

Colonel Willis, Mint Master, Bombay, and Mr. Ascoli, Controller of Printing, Stationery and Stamps, recommend, after a careful and exhaustive inquiry in England into the official and unofficial systems of manufacturing and printing security paper, that such work should be undertaken in India, and that the existing contracts with Thomas De La Rue and Co. and the Bank of England be terminated in December, 1924—says a Reuter message from Simla.

The capital expenditure on buildings, printing press, etc., would cost over 26 lakhs, and the recurring expenditure would be 28 lakhs. They criticise the existing rate and point out that the manufacture of stamp papers and one rupee currency notes in England costs £360,000 annually, while the manufacture of the same in India would cost £190,000. This estimate they regard as generous.

Apart from economy, manufacture in India would eliminate the chances of the disappearance of security papers in transit from England to India. They recommend that the work be done by the Indian Government, as the danger of entrusting the work to an inexperienced firm is very great.

The only other alternative, they say, is to entrust an experienced British firm, resident in India, provided that suitable arrangements can be made.

Readers' Pensions Committee.

It is announced that the annual dinner in aid of the funds of the Readers' Pensions Committee will be held on October 20th, at the Holborn Restaurant, with Major the Hon. J. J. Astor, M.P., in the chair.

The appeal issued by the executive states: "The generous support accorded in the past to the work of providing pensions for printers' readers and widows of readers encourages the Readers' Pensions Committee in once again appealing to their many friends on the occasion of the annual dinner. The committee have cause to be grateful for the readiness with which influential ladies and gentlemen have accepted the responsibility of presiding at the annual dinners, and they are glad to be able to announce that at this year's gathering the chair will be taken by Major the Hon. J. J. Astor, M.P. Largely as a result of the assistance given by the Pensions Committee, six readers and a reader's widow were successful, on their first application, at the last April election of the Printers' Pension Corporation (through whose agency the committee operates). These candidates had themselves for many years been subscribers both to the Corporation and to the Readers' Pensions Committee. Three of them had subscribed to the Corporation between 30 and 40 years, three between 40 and 50 years, and the seventh 55 years. Fifteen pensions have been established by the committee. It is hoped that others may be added rapidly, in order that the provision made may in some measure meet the needs of the rapidly increasing number of cases seeking the committee's aid."

In a personal letter which accompanies the invitations to the dinner Major Astor says: "As you are aware, this excellent charity provides for readers who are incapacitated either by age or illness, and the success of the annual dinner means a great deal to them. I need not emphasise the importance and value of the readers' work both in connection with the press and with literature generally. Any contribution you may be good enough to send will, indeed, assist a worthy object."

Any lady or gentleman to whom an invitation to the dinner has (through inadvertence) not been sent should communicate with Mr. J. Hood (the hon. treasurer), St. Bride Institute, Bride-lane, E.C 4, who will be pleased to remedy the omission.

The committee have decided to name the pension (the sixteenth), which they hope to complete this year, the "W. A. Perkins' Pension," in recognition of that gentleman's 20 years' connection with the work, first as a member of the executive, then as hon. secretary, then as hon. treasurer, and now as chairman.

At a recent meeting of the executive a resolution (which has been forwarded to Miss Treloar) was passed expressing regret and sympathy at the death of Sir William Treloar, one of the vice-presidents of the committee.

It was recalled that when Sir William took the chair at the annual dinner in 1907 his anxiety to fulfil his engagement was so great that he hastened from a royal command gathering at Windsor, and apologised for not having time to change into evening dress.

Technical Education at Birmingham.

For the coming winter session a series of very useful printing trade classes have been arranged at the Birmingham Central School of Arts and Crafts, and the hope is entertained by the trade, which is largely represented on the Advisory Committee, that Midland firms with apprentices will afford adequate facilities for their attendance. The apprentices' day classes are for compositors and machine printers, lithographic artists and draughtsmen, the committee's belief being that this is the best means for developing initiative and skill, and thus improving both the quality and output of the craft. There are full-time day pre-apprenticeship courses covering two years, 14 to 16; part-time day courses for apprentices (Mondays and Thursday mornings, 8 to 12.30, and one, or more, evenings per week); and evening classes in compositor's work—practical and printing theory; letterpress machine printers (a Miehle machine has been installed); monotype composition and casting (the recent installation of a caster completes the monotype equipment); linotype composition (7 to 9); lithographic artists' work; bookbinding—letterpress and wood-engraving, and book-decoration. The bookbinding is a practical class, restricted to trade students. The trade representatives on the Advisory Committee are Mr. F. H. Cond and S. H. Terry (Master Printers' and Allied Trades' Associations), Mr. W. S. Walker (Typographical Society), Mr. F. H. Bruff (Printers Managers' and Overseers' Association), Mr. R. W. Carter (Amalgamated Society of Lithographic Printers), Mr. E. A. Bierman and Mr. A. G. Morris (Association of Master Process Engravers), Mr. G. H. Lawson and Mr. H. Olorenshaw (Artists' and Process Workers' Association), and Mr. C. E. Corbett (Bookbinders' Union). The following is the staff, all thoroughly practical men: Typography: Compositors, Mr. E. J Terry; theory, Mr. W. H. Sheath; machine printers, Mr. F. L. Whateley; monotype work, Mr. T. Gill; linotype work, Mr. F. Cottrell; book binding, Mr. F. G. Garrett; lettering and design for lithographic artists, designers and printers, Mr. A. M. Fletcher; wood-engraving and book decoration, Mr. Bernard Sleigh, and English, Miss W. K. Parnell.

THE subject of pulpwood and woodpulp has been added to the list of questions to be discussed at the Imperial Economic Conference to be held in London in October.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion	3/0
Three Insertions	6/0

For every line exceeding three lines 1/.

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion	1/6
Three Insertions	3/0

For every line exceeding three lines 6d

Sales by Auctions, Tenders,
Patents for Sale,
Legal and Financial Announcements

Per line	1/0

Replies may be addressed to Box Numbers, Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C.4, for which a fee of 6d. is charged to cover Postage of Replies.

Cheques and Post Office Orders to be crossed and made payable to STONHILL & GILLIS.

Telegrams: Stonhill, Lud, London.
Telephone: 8407 City.

Tenders.

H.M. STATIONERY OFFICE.

TENDERS, to be delivered before noon on Monday, 8th October, 1923, are invited from firms having London Works, for a CONTRACT (Division III., England) for LETTERPRESS BOOKBINDING IN LEATHER, BUCKRAM, CLOTH, etc.

For particulars apply to the Controller, H.M. Stationery Office, Princes-street, S.W.1. 14250

Situations Vacant.

AGENT required to SELL LUBRICATING OILS unequalled for quality and price by old-established firm.—Write, Box 433, Sells Advertising Offices, Fleet-street, E.C.4 14249

CLERK (Junior) for Bookkeeping, etc., wanted in a Newspaper Office; state qualifications, salary, etc.—Box 14237.

SUBSCRIPTION CANVASSER wanted for old-established Printing Trade Journal; ground, South of England.—Reply, in first place, to Box 14162.

Situations Wanted.

BINDER and FINISHER, practical all-round Account Book, Costing, Estimating, etc., seeks sit.—C. D., 47, Somerset-road, N.18. 14239

COMPOSITOR wants employment; General Jobbing, Tabular, Catalogues, Magazines, Weekly News, etc.—Please respond to G Bradley, 26 Chapel-lane, Barton-on-Humber. 14238

FOREWOMAN (PRINTERS) disengaged; experienced; energetic and reliable; good manageress.—R. L., 3A, Brondesbury-road, Kilburn, N.W. 14241

PRINTERS' MANAGER, 20 years' London experience, seeks similar position (Works or Sole Control), or as REPRESENTATIVE; Practical Costing, Estimating, Organisation, Correspondence; highest references; personal connection.—Box 14240.

PRINTERS' WAREHOUSE OVERSEER seeks re-engagement; practical all branches, all machines, tactful disciplinarian, good refs.—Replies to Box 14246.

Machinery for Sale.

SMYTH-HORNE, LTD.,
1-3, Baldwin's-place,
Gray's Inn-road, London, E.C.1.

Occasionally we have Rebuilt Smyth Book Sewing Machines to offer, such Sewers having been thoroughly overhauled and refitted with New Standard Parts where necessary. We erect and teach on a trial basis.—Box 13993.

Miscellaneous.

WASTE PAPER: ITS RECOVERY AND RE-MANUFACTURE. By Jas. Strachan. A Fund of Information; price 12s. 6d.—Stonhill and Gillis, Publishers, 58, Shoe-lane, London, E.C.4.

United States—LOCKWOOD TRADE JOURNAL CO., 10, East 39th-street, New York.
Representatives also in Australia, India, South Africa, Canada, etc.

THURSDAY, SEPTEMBER 20, 1923.

Print versus Pulpit.

AT a meeting last week of the Portmadoc Council it was decided, on the motion of a certain Mr. Jones, that cinema placards exhibited on the walls of the Town Hall must henceforth be veiled on Sundays on account of the posters being an "unsightly and disturbing element to people on their way to places of worship." Mr. Jones is reported to have said, in the course of the Council's discussion, that it was possible that people on their way to chapels are so affected by the placards that they are unable to listen attentively to the sermon. Rather strange, is it not, that pictures which, on six days of the week, are approved of as being in keeping with the dignity of the Town Hall should on the seventh day become "unsightly"? Apart, however, from the sightliness or unsightliness of these pictures, it would seem to be an implied compliment to the printers to suggest that their posters are able to make a mental and emotional appeal such as to eclipse even the fervid oratory of the Welsh pulpit.

Labour Newspaper Problems.

THE *Daily Herald* crisis draws special attention to the difficulties with which a Labour newspaper in this country is necessarily faced. There are some who blame the *Herald's* editorial policy for the inadequate public support which that paper has called forth. To an extent we sympathise with such critics, for the printing trade knows, as do other trades, that the *Herald's* penchant for revolution has sometimes tended to make it unduly sympathetic towards insurrectional elements in trades unionism instead of maintaining its stand as far as possible on the principles of collective bargaining and of loyalty to responsible union leaders. We do not, however, hold this to be a major factor in the *Herald's* non-success, and we note with interest some remarks in this connection made last week in the *Daily News* by Mr. Frank Dilnot, formerly editor of the first official Labour daily newspaper, the *Daily Citizen*.

Essentials of Newspaper Success.

MR. DILNOT rules out the suggestion of mistaken editorial policy and emphasises certain fundamental disadvantages which a paper owned by a party has to face. One of them, he points out, is its essential propagandist nature. A newspaper, if it is not to incur heavy loss, must primarily provide what the public wants, a wide range of news and views of a nonpartisan character, and its political line must be the free and individual expression of its proprietors, who are, of course, at liberty to diverge from party prejudices when they feel it is right to do so. That is what gives a paper some of its vital interest to readers. Further, the special disadvantage of a Labour newspaper is that, even with a substantial if not a great circulation, its advertisement revenue can never equal proportionately that of its rivals. Mr. Dilnot pays little attention to the plea of prejudice against Labour newspapers; advertisers and business men place their orders where they can get results, and they soon find out from experience where those results are to be obtained. These two considerations alone, in his opinion, put out of court a Labour daily paper except it is subsidised deliberately and systematically by the trade unions. But this very subsidy stamps the paper as propagandist, and confines its purchase to the elect. He thus comes to the conclusion that a successful Labour daily must be an individualist effort and a capitalist effort.

Enterprise and Advertisement.

SOME very effective advertisement folders and sample sets came into our hands recently from a prominent papermaking firm, in which the application of colour played a very prominent part. The schemes had evidently been well thought out by an experienced and artistic head. Doubtless this form of advertising is costly, but it almost ensures the matter receiving scrutiny and saves it from the waste paper basket. Other papermakers and merchants of our acquaintance would do well to adopt a similar forward policy in their efforts at publicity. If printers and papermakers cannot between them set a lead in methods of advertisement, they should be the last to complain of lassitude in other trades. Yet it is a remarkable fact that taken as a body printers do practically no advertising of their own, while the bulk of papermakers and paper merchants display no advancement on their pre-war attainments.

St. Bride Lectures.

St. Bride Foundation Institute, Fleet-street, has arranged an excellent winter series of lectures and meetings, for journalists, printers and others, in collaboration with London University. The session's scheme is as follows:—

Tuesday afternoons. — Twenty-four lectures, beginning October 2nd, on "Social and Industrial History of England during the 19th Century." Lecturer, Professor Gilbert Slater; Tuesday evenings. — Twenty-four lectures beginning October 2nd, on "Ancient and Mediæval Literature," by J. H. Weatherall; Wednesday evenings. — Twenty-four lectures, beginning September 26th, on "Makers of Modern Music," by Ernest Markham Lee; Thursday afternoons.—Twenty-four lectures, beginning October 4th, on "Mediæval and Renaissance Europe," by C. Delisle Burns. A series of general lectures has also been arranged, beginning on September 27th, with "Seven Business Virtues," by Lord Riddell.

ASSOCIATION OF
Master Printers of South-East London

Lecture by Mr. C. A. Bates.

The monthly meetings of this Association were resumed on Tuesday of last week at the Bridge House Hotel, London Bridge, S.E. The chair was occupied by Mr. G. Poulton (president), who was supported by a good gathering of the members. After the transaction of some brief Association business an interesting lecture was given by Mr. C. A. Bates (Messrs. Johnson, Riddle and Co., Ltd.), who gave an account of his experiences in America as a delegate to the Convention of the Associated Advertising Clubs of the World, held in Atlantic City in June.

The minutes of the May meeting were read by Mr. F. Mason (hon. secretary) and duly confirmed.

Replying to a point raised by the chairman regarding the wages of platen machine minders Mr. J. Brigenshaw said the question was still in abeyance.

Mr. Poulton then invited suggestions from the members with a view to making the meetings more useful and interesting. He also briefly referred to the meeting at Dartford in June and the visit to the *Daily Telegraph* Paper Mill paid by the Association on the same day, which he said was one of the finest gatherings any District Association had ever held.

Mr. Mason took the opportunity of welcoming to the meeting Mr. W. A. Northam, a past president, who had come back to print after an absence from it of several years.

In introducing Mr. Bates the chairman said they were all acquainted with the fine class of work for which his (Mr. Bates') firm was responsible.

Mr. Bates, at the outset of his address spoke with enthusiasm of the activities of the Thirty Club in its endeavour to raise the status of advertising. During his stay of thirty days in the United States he discovered that advertising was given far greater prominence there than was the case in this country. In the States, he added, the "ad man" ranks with the lawyer and the architect. A boy may be a parson, a lawyer or an "ad man." As a matter of fact over there the "ad man" was "some" man.

After explaining how the "Thirty Club" set to work to get together a party to visit the United States as the official delegation to the Advertising Convention, Mr. Bates made allusion to the many amusing episodes experienced on board the "Berengaria" on the way from Southampton to New York. Knowing that many of the passengers on board were advertising men, the Cunard Co.'s officials naturally gave them every attention and saw to their comfort to a very marked degree.

On arrival in New York they got the first taste of the welcome that was awaiting them at a dinner, at which were prssent Mr. Houston and about 80 prominent men connected with advertising and the newspaper world. While here Mr. Bates took the opportunity of examining at close quarters the developments of the printers' craft. All the printers he came in contact with gave him a hearty welcome, and were not afraid of revealing to him any secrets. On the contrary, they could not be candid enough in explaining fully the details of the work they were doing.

From New York Mr. Bates proceeded to Atlantic City, where the Convention took place. At this gathering all phases of publicity were discussed.

Mr. Bates incidentally mentioned the visit he paid to the Curtis Publishing Co., and referred to the *Saturday Evening Post*, which has a circulation of two-and-a-quarter millions, an advertising rate of the equivalent of £2,000 per page, and for which an advertisement had to be in the printers' hands eight weeks before production to ensure its appearance.

After briefly referring to a visit paid to the White House and being introduced to the President, Mr. Bates told of some experiences in Chicago. Here he went to one of the leading employing lithographers in America, who, however, wanted at first to quarrel with him because he had been forty-eight hours in the place without having let him know. In Chicago an inspection was made of several colour printing shops, and he did not see a single flat-bed machine nor a lithographic stone.

As showing the big things done in America, Mr. Bates next drew attention to a recent mammoth copy of the Sunday edition of the *New York Times*, which he passed round the room for inspection. Printed in ten separate classified sections, each section covered some phase or activity of life.

Raising the Status of the Printer.

Coming nearer home Mr. Bates emphasised the necessity of printers as a body lifting themselves from the ordinary low status they were in to day. They had to blame their forbears for not having looked at print from the point of view of the harm that would accrue from allowing so many creative agencies to come into existence to the detriment of the production of real craftsmen. A great number of printers were now more or less content merely to sell paper and ink. He was glad to see a move being made by the Federation to raise the status of their trade by cultivating the creative side of it. If they moved in the direction he had indicated, he was sure they would help all other trades at the same time. If they took the world as they saw it to-day, there were hundreds of advertising agencies where that creative faculty he had referred to existed. That creative faculty, he thought, should never have gone out of the print shop. He believed it would be of great benefit to them if they could get the agency business grafted on to theirs. If they were to run that creative side in conjunction with their business activities, instead of just selling paper and ink, he was confident it would be the salvation of their industry. On the other side of the water it was done to a terrific extent, and over there they were a long way ahead of us in this respect. Mr. Bates asked them to survey the field of operations in commerce, and then having done that, suggest something that would help it. In that way they would put print in a vastly better position than it was in to day.

Mr. Bates spoke in the highest praise of the welcome he had received everywhere while in America.

Votes of Thanks.

Mr. Poulton said he had very much enjoyed the lecture, and was glad it had pointed a moral to them. He thought it was better to enjoy life by going all out for creative work rather than by cutting another printer's throat.

Mr. G. W. Neves, in moving a vote of thanks to the lecturer, referred to the visits he had made to the United States and Canada. While in the former country he went into several offices, and from the manager down to the stereotyper he was made at home. What surprised him most was that they told him everything he wanted to know.

Mr. Northam, in seconding, said he felt with Mr. Bates that the future of the printer rested to a very great extent in the creative end of his work.

The vote of thanks was put to the meeting and very cordially carried.

Mr. Poulton, in drawing attention to the claims of the Printers' Pension Corporation, said they were rather late last year in getting their plans forward. Subscriptions this year were to be devoted to the War Orphans' Fund, and he appealed for liberal support from members of the S.E. Association; subscriptions should be sent to Mr. Gordon Brew.

Mr. Bates said he had received a letter from the manager of John Dickinson's mill at King's Langley in reference to a visit of the Association to the mill.

After some discussion it was thought that a visit to the mill in the spring would make a very enjoyable outing.

Mr. J. Lack said that the District Associations never came together, and he thought that if in the winter they could organise official visits of one section to another it would be of very great use.

Mr. Poulton expressed sympathy with the idea and said the committee no doubt would consider the matter.

Personal.

LORD RIDDELL opened on Saturday an instructive and interesting exhibition of the photographer's art, arranged by the Royal Photographic Society of Great Britain, at 35, Russell-square, W.C.

ALDERMAN SIR ROWLAND BLADES, M.P., on behalf of the members of The 1912 Club, will to-morrow evening make a presentation to Captain Gerald Coningham on the occasion of his marriage with Miss Ruby Graham Crookes, which will take place on September 27th at Folkestone.

MR. DAVID ADAMS, M.P., is one of the participants in the controversy which is still going on at Newcastle-on-Tyne over the subject of the alleged printers' "ring" in that city. He supports the allegation of unfair trading which have been made against the master printers' organisation.

THE honorary degree of Master of Arts was, on Thursday, conferred on Mr. F. Peaker, president of the Institute of Journalists, by the University of Leeds. In presenting the recipient Professor Barbier said Mr. Peaker was a Leeds man, having been a representative on the old Leeds School Board and later on the Leeds Education Committee. In 1904 he left Leeds and began his career as a journalist.

MR. MAURICE B. ADAMS, F.R.I.B.A., the architectural editor of the *Building News*, is to retire at Michaelmas after 51 years' continuous service.

MR. A. CHADWELL, president of the Electrotypers, Stereotypers Managers' and Overseers' Association, was in his accustomed place at the monthly meeting of this organisation on Tuesday evening at St. Bride Institute. His return, after his very serious illness, gave great pleasure to the members present.

COUNCILLOR RHYS JONES, of Aberystwyth, has been presented with a silver-mounted walking stick on resigning the secretaryship of the Aberystwyth Branch of the Typographical Association after 10 years' service.

MR. ARTHUR WILSON, a member of the literary staff of the *Sheffield Independent*, has been the recipient of a clock and cut-glass salad bowl from his colleagues on the occasion of his marriage to Miss Kathleen May Whittaker.

MR. H. P. JENKINSON, of the literary staff of the *Yorkshire Evening Post*, was married on Saturday, at Bradford, to Miss Frances Elizabeth Scott, daughter of Mr. J. Scott, J.P., of Bradford.

MR. CECIL E. COBB, of the sub editorial staff of the *Sheffield Independent*, and formerly secretary of the Swindon branch of the National Union of Journalists, has been married to Miss Grace Eyels, of Swindon.

THE greatest of all faults is to be conscious of none.—CARLYLE.

The Bookbinder

At the Sign of "The Ship."

A Well-Known Bindery Visited.

Passing the other day along Great Saffron-hill, that comparatively secluded but most important business thoroughfare which finds itself between Farringdon-street and Hatton-garden, we called in at the Ship Binding Works, and, by the courtesy of the general manager, Mr. H. Mills, were accorded the privilege of a tour of the premises. A visit to a bindery is always of interest, and especially so when, as in this case, one finds considerable manufacturing resources in busy activity and arrangements being made for extension of the business.

Started in 1887, the firm did not at first attract much attention in the trade, but of recent years it has been making considerable headway, notably under the managership of the late Mr. James Abel, who served the company from 1894 to 1916, and under its present general manager, Mr. Mills.

It was expected that the mantle of Mr. Abel would fall upon his son, Mr. Edgar Abel, but the latter happened to be on war service at the time of his father's death, and Mr. Mills accordingly accepted the position of manager, first in a temporary capacity—expecting to give place to Mr. Edgar on his return from the front—but later permanently owing to Mr. Edgar's unfortunate decease. Mr. Edgar Abel, by the way, had a notable record of war service, in the course of which he gained the Military Cross, was taken prisoner by the Germans and died in a German field hospital.

In Mr. Mills, however, the firm has an experienced and resourceful principal, who has been with the Ship Bindery for no less than 33 years. Long as that service is, it is even exceeded by that of other employees in the same house, some of whom started in the business at its very beginning. Amongst these are two of the present foremen, Mr. Leishman and Mr. Hatton, as well as a number of workpeople, both men and women.

The large and substantial premises to be found at the sign of "The Ship" were built in the late 'eighties, and were designed especially as a bookbinding works. The building is in several floors, as is usual in London where ground space is so expensive, but special care is given to facilitate the ready passage of work from one end to the other of its travel through the different departments, and in this connection use is made of lifts and of handy transport trolleys designed to be slipped under whole stacks of books, etc., and quickly moved from one part of the floor to another.

The works are well provided with up-to-date machinery and equipped on a scale that makes possible economical mass production. The routine of work and arrangement of departments are naturally on similar lines to those of many binderies which we have heretofore described. The illustration which we are able to publish herewith gives a glimpse of one of the Ship departments showing a fine battery of Smyth sewing machines at work. There were also to be seen, of course, many workers engaged in folding, by hand and machine; others engaged in forwarding, the equipment including one of the powerful Seybold three-knife trimming machines, and moreover an interesting piece of machinery, not very often seen in London binderies, the Parkside lining machine which, geared up with a Crawley rounder and backer, puts on the first and second linings after the rounding of a book. Other workers were putting the books into their covers, Smythe casing-in machines being a feature of this department. Our inspection concluded in the basement, where we found the large gas engine which provides the works with power, and where are also the machine tools for the use of the firm's engineers, who do necessary repairs on the premises.

A department not previously mentioned, though not the least interesting, is the canteen, to which the top floor of the building is devoted. This represents a comparatively recent "welfare" development which is very markedly to the benefit of the workpeople. A bright, well lighted and airy floor is fitted up partly as a kitchen for the purpose of supplying cheap and wholesome fare, or for the cooking of such food as the firm's employees care to bring, and partly as a hall (provided with a piano) that can be used for dances, whist drives, lectures, and other recreational activities. The Ship Bindery is one of those that have grasped the advantages derivable from the "works committee" and the setting up of such a committee has resulted in some valuable suggestions for the promotion of the employees' welfare, and the harmonising of conditions generally.

We were interested to note some familiar editions of classic authors, and of school text books amongst the volumes seen in the course of their passage through the bindery.

Part of the Sewing Equipment at the Ship Bindery.

Digitized by Google

Limited editions, some in very handsome bindings were also observed. It was satisfactory to note that there is plenty of space available, and that the premises provide room for expansion. Expansion is, in fact, now proceeding; at one point a new quadruple Dexter folding machine was seen in the course of erection, whilst extension is also being made to bench accommodation. One came away with the pleasing impression of a large establishment which, even at the present difficult time, is able to keep busily occupied, and which is enterprisingly increasing its resources in the faith that better times are in store for the British bookbinding industry.

Notes and News.

The State of Trade.

Trade is reported to be still rather slow in the bookbinding industry and many houses are suffering severely from the slump. The trade houses are particularly hard hit and publishers binders are very little better off. Here and there a few houses on overtime may be met with and before long there should be extra work provided on the various year books and Christmas editions. Price-cutting is in active operation among commercial bookbinders for what large orders there are, and it is scarcely to be doubted that a good many orders are taken and executed at a loss. The winter outlook is far from bright if existing signs are to be accepted. Heavier unemployment lists are predicted in many important industries; the past weeks have witnessed a decline in trade, and the situation generally is far from reassuring. The best we can hope is that there are unforeseen circumstances that will operate in our favour and bring in their train a brisker period of business than appears to face us at present.

Binders and Technical Training.

At this season of the year most of our technical institutes are busy preparing the way for the winter session with the various classes in bookbinding. Unfortunately there are not the same facilities for students from the bookbinding section as there are for the more highly favoured typographic apprentices. Very few schools are adequately equipped to teach bookbinding thoroughly. As a rule there are very few classes, and in what classes there are there is inevitably a lack of modern plant. But a short time ago bookbinding was a handicraft, and all that was necessary for teaching the practical part of the trade was a bench and a few tools. Nowadays bookbinding stands out as pre-eminently a mechanical industry with but a minimum of handwork. Only a select few among the more artistic literary binding establishments can survive under the old methods. In stationery binding the firm that depends mainly on handwork cannot enter into competition against its better equipped contemporaries.

Handicraft *versus* Mechanism.

A sound theory in the handicraft of bookbinding may be and is indeed an essential part of the training to be served out to aspirants for honours in trade lore. It is no less an essential factor in the creation of a first-class workman. But as so much of modern bookbinding is performed on machines of one sort and another it is imperative that students should be taught all that they can be taught about the various types of machines. The best type of teaching is that constituted by sound theory augmented by actual practice on the machines. If the training classes are not provided with the equipment necessary for demonstration and practice it is difficult, if not impossible, to impart knowledge and understanding of real value. Unfortunately the plant is expensive and largely of foreign origin, therefore difficult of acquisition by departments whose guiding principle is economy.

Colouring Basils.

Some bookbinders are not aware that basils may be coloured by either dyeing or staining. The stained skins are cheaper, and of course inferior. When used in covering, the pasting and stretching disturbs the surface colour and gives rise to a mottled or faded effect. In the case of cheap work this may be a matter of small moment but it is distinctly objection able in that class of work which aims at a standard.

Price of Basils.

Red basils of exceedingly good quality and finish are offered at 7d. per square foot by a house of repute.

Pigskin as Covering Material.

A Scottish tannery, specialising in pigskins offers a wide range of colours for loose-leaf binding at prices running from 1s. to 1s. 10d. per square foot. Pigskin is a highly favoured covering for loose-leaf ledgers, mainly because of its capacity to withstand hard wear and tear over a prolonged period. A well-known house in the loose-leaf trade conducted a test some time ago in order to ascertain definitely under the most rigorous conditions the class of leather most serviceable for ledger bindings. A much-used staircase was carpeted with cowhide and pigskin and the leathers subjected to the strain of ordinary traffic over a given period. At the end of this time it was clearly demonstrated that the pigskin showed less sign of wear.

Prices of Strawboards.

Strawboard prices have been falling very consistently for a month or two owing to ample supplies at home and abroad and a slump in the demand. To-day's quotations are round about £8 per ton for 8 oz. to 20 oz., and £1 5s. per ton extra for 1¼ lb. and upwards. These figures are just under twice the pre-war price and can leave little margin for the makers. Doubtless the growing competition from English-made boxboards is an additional reason for the easier terms operating in regard to the foreign board. For printing and box-making purposes there are many users who have a decided preference for the British product.

Advance in Gold Leaf.

Gold leaf has advanced about 5s. per 1,000 leaves owing to diminished supplies and higher prices operating on German leaf.

Leather Cloths.

Samples of Levvarex to hand cover a wide range in qualities, shades and designs in leather cloths. The quality leaves very little to be desired and the finishes throughout reach a very high standard. Along with other similar productions in leather cloths, the thicker substances in Levvarex are finding a heavy market among upholsterers, motor car manufacturers and loose-leaf ledger specialists. Bookbinders themselves find these leather cloths economical to work in every way. They cut out to greater advantage, work easily and can be handled at a quicker speed than most leathers.

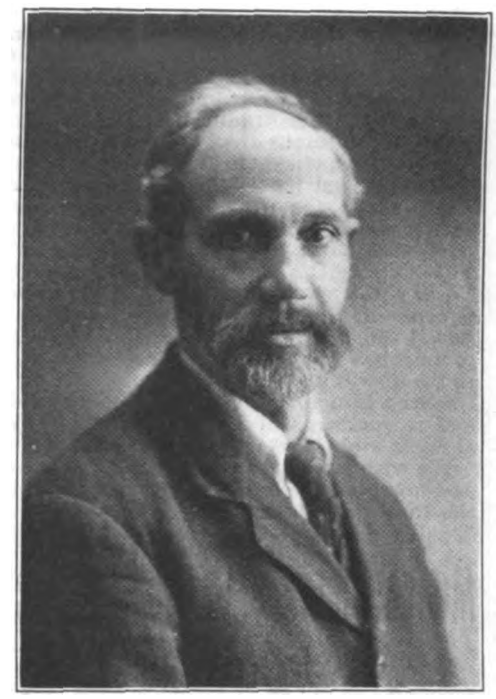
American Bookbinders' Convention.

The Employing Bookbinders of America are arranging to hold at Washington, on October 22nd, 23rd and 24th, their third annual convention, which promises to be of much interest and value, according to information kindly passed on to us by Mr. E. B. Judd, of the Nevitt Bookbinding Co. Efforts are being made to draw a representative attendance of bookbinders from all parts of the United States, and amongst those expected to be present we note the name of Mr. George R. Carter, the U.S. Public Printer.

Besides organisational addresses and discussions, there are to be papers on "Sociological Problems in Bookbinderies," "Stabilising the Bookbinding Industry," and "The Binding of School Books." What should prove very helpful, also, is an exhibition of bindings, for which arrangements are being made. Every member is asked to send along at least four or five samples of his work, either completely bound volumes or bindings in course of production showing unusual steps in the work. All classes of binding and rebinding are to be exemplified, and master printers and the general public are to be given opportunity to inspect the exhibits.

Amongst problems which are facing American binders, and which are sure to be discussed at the Convention, are questions of bookbinders' costing and the need for some degree of standardisation in respect of the colours, patterns and qualities of book cloths.

The Employing Bookbinders of America is an association formed some three years ago, which appears to have already attained a very high standing and to have accomplished much in developing scientific management in all branches of the American bookbinding industry.



LONDON SCHOOL'S

Additional Bookbinding Instructor.

Mr. Chris. W. Atkins.

Our readers will join with us in offering hearty congratulations to Mr. Chris W. Atkins, late of the Co-operative Printing Society, Ltd., Tudor-street and Surrey-row, who this month takes up his appointment as an instructor of bookbinding under the L.C.C. at the London School of Printing and Kindred Trades.

Born in 1862 in the shadow of St. John's-Gate, Clerkenwell, he entered the world of

Mr Chris. W. Atkins.

print at Messrs Shaw and Sons, Fetter-lane, as an errand boy in 1875, and in the following year was apprenticed as a bookbinder. He remained with Messrs. Shaw and Sons until 1891, when, as a result of his association with the "Eight-hour-day" movement, he left.

In October of the same year he entered the binding department of the Co-operative Printing Society as a binder, under the late Mr. Frederick Rogers, who, by the way, had also served with Messrs. Shaw and Sons. Mr. Atkins always had a profound respect and admiration for Mr. Rogers, and he regards Mr. Rogers as the man who shaped his future. He likes to speak of him as one of Nature's noblemen, a great orator, and a recognised Elizabethan scholar. In 1899, Mr. Rogers, then in charge of the binding department of the Co-operative Printing Society, retired to take up a post as organising secretary to the Old Age Pensions Committee, a post he held until the Old Age Pensions Act was passed. Mr. Atkins assumed control of the binding department in Mr. Rogers' place, and he has occupied that position continuously up till the time of his retirement this month.

We think a happy choice has been made in selecting Mr. Atkins as an instructor. Not only is he able to draw upon a wide and up-to-date practical experience, but he has also a firm belief in "pride of craftmanship." Slovenliness and unreasoning "rule of thumb" methods annoy him, and he has always endeavoured to impress upon the many apprentices he has trained the necessity for thinking out a job and working intelligently. He enters upon his fresh sphere of activity full of a desire to impart the accumulated knowledge of a lifetime to those willing to be taught, and, in teaching others, to learn himself.

Outside the "cloth-bound board" of his business life, Mr. Atkins has found time for numerous interests. Trade society matters early claimed his energies, and for 50 years he has been actively engaged in factory and labour movements. He has held office in his trade union continuously for 30 years. For seven or eight years he was a member of the Executive of the Printing and Kindred Trades Federation (London Section), and he now

Digitized by Google

acts as trustee of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers and of the bookbinding Section of the same union.

For many years he has been a member of the Stationers' Mutual Benefit Society, for which he has done some eminently useful work. Then again, Mr. Atkins has identified himself very closely with the fine work carried on by the Vellum Binders and Machine Rulers' Pension Society. One of the questions which this organisation has fiercely espoused for many years has been the inequity of the deduction that is made from the State Old Age Pension in the case of workers who, after many years of thrift, find some of their savings penalised. Mr. Atkins has made this question his own and has not been afraid to speak out whenever opportunity has occurred.

Another direction in which he has won for himself considerable reputation is as a member of the Printing, Bookbinding and Kindred Trades' Overseers' Association. Apart from many interesting lectures which he has delivered to this organisation at different times, his opinions regarding contemplated changes of policy or of programme have always carried much weight. His membership of this Association covers a long period, during which he has become very popular.

His more intimate friends remember him as a keen cricketer and cyclist in years gone by. To-day the chairmanship of the Palmers Green and District Allotment Association and 15 rods of allotment keep him busy, but rumour has it that he sometimes steals away to the bowling green.

Born a Londoner, he loves "Old London," and in moments of leisure delights to chat about it and the Fleet street of yesterday.

We wish him every success in his new post and hope that he may live long to enjoy the freedom which his retirement brings him.

Manchester Master Printers' Lunch.

Lord Mayor as Chief Guest.

The Manchester and Salford Master Printers' Association met at lunch on Thursday, when the principal guest was the Lord Mayor of Manchester. Mr. H. A. Bethell presided.

Mr. R. G. Evans proposed "The Prosperity of Manchester," and recalled the city's early association with the printing press in 1588, though unhappily it was producing seditious literature.

The Lord Mayor, in responding to the toast, also recalled some interesting facts from the city's past, and went on to stress the value of the public service in modern Manchester, asking if the public fully appreciated what was done for them within the Corporation by men working without fee or reward.

Mr. H. A. Bethell explained that the members of the association had met so that the trade of printing should be brought more clearly before the eyes of Manchester. There were many in the trade who were quite prepared to assist the Lord Mayor in the work he and his colleagues were doing, and in particular they were anxious to see his work for the hospitals succeed. Twenty-one printing concerns had arranged to hold a collection every Saturday for the fund, and the committee hoped this week to increase that number.

The Lord Mayor, in returning thanks, said he was convinced that the work of the hospitals would cost three times as much if it came on the rates as by voluntary effort, and he was determined and hopeful that he would free the local hospitals from debt before his term of office expired.

The Late Mr. Owen Connellan.

The funeral of the late Mr. Owen Connellan, J.P., the Deputy Lord Mayor of Leeds, and for many years a leading member of the Typographical Association, which took place at Leeds, was attended by a large gathering of the public men of Leeds and by representatives of the printing and newspaper trades, including: the Lord Mayor of Leeds; Mr. A. Grime, the general manager of the *Yorkshire Post*; Mr. J. W. Miller, the overseer of the *Yorkshire Post*; Mr. R M. Lancaster, ex-secretary of the Leeds branch of the Typographical Association; Mr. J. D. French, president of the Typographical Association; Mr. J. Braily, Leeds Printing and Kindred Trades Federation; Mr. W. Bottomley, executive council of the Typographical Association; and Mr. J. Robertson, representing the "companionship," of the *Yorkshire Post*.

Printers' Managers and Overseers ASSOCIATION.

MANCHESTER AND DISTRICT CENTRE.

About 40 members, ladies and visitors put in an appearance for the bowling handicap at the Bull's Head Hotel, Hale Barnes, on the 8th inst. With such a good attendance, and nearly all bowling, by the time the final contest was reached, the shades of evening were falling fast, and it became a question whether it would be better to defer the final to another day. However, it was decided, the contestants agreeing, to play off at once a game of 15 up instead of 21, Mr. J. P. Hardisty receiving 3 points instead of 6 points. This gentleman proved to be "the dark horse" of the afternoon, and the handicap was too severe for Mr. Chas. N. Knowles, as Hardisty ran out the winner by 15 points to 6 points.

The final result was:—First prize (clock), Mr. J. P. Hardisty; second prize (set of military brushes), Mr. Chas. N. Knowles; third prize (cigarette case), Mr. E. McVay; ladies' prize (silver-plated sugar scuttle), Mrs. A. E. Crossland; visitors' prize (tobacco pouch), Mr. A. W. Westgate.

After this there was a hurried adjournment from the green to the Hotel, when the president took the chair. In his opening remarks he expressed the pleasure it gave him to greet such a large gathering, and he was sure all had enjoyed, not only the games, but the lovely afternoon in the country. Before presenting the prizes, he suggested the winners should keep them where they could be seen, so that they would be constant reminders of the duty of each member to attend as often as possible the meetings and gatherings of the Centre. He had also noticed that some of the best bowling during the afternoon had been done by members who had not yet put in an appearance when they had bowling matches on, and he hoped that in future they would rectify this. The president then presented the prizes to the winners. In presenting the visitors' prize to Mr. Westgate, he said that it gave him great personal pleasure, because when he first came to Manchester Mr. Westgate was the first gentleman he met on business matters.

The prizes having been distributed, Mr. F. Scouler (vice-president) said how delighted he was to see such prizes as had been given. He himself had been responsible for providing the green and he had done the best he could, but was sorry he had not been able to procure a better one. He thought the green that afternoon had been too much like the Banks and Braes o' Bonnie Doon. He then expressed the thanks of the members to the president and lady president, Mr. J. Clarke (Blackpool) and the Manchester Council for providing the prizes for the afternoon.

Several members then criticised the way the handicapping had been done, although in some circumstances they said it had been to their benefit.

Vice-president Scouler protested against such criticism, saying the committee had done their best under the circumstances, but acknowledged that they had erred in one way, and that was not knowing the capabilities of all the members as bowlers, they had given points instead of placing them back, but this would be remedied in any future handicap. He expressed the hope that the better bowlers would in future help them to win the cup once more instead of having the Council to do all the work.

Mr. McVay here urged that all should be sincere and feel that all had done their best, and that the winners had justly won. The whole event had been brought about by an effort, and that effort had been supported by all who had given prizes and otherwise helped.

Mr. Hardisty said it was the first handicap he had been in, and therefore it was the first time he had won a prize. It was quite a pleasure to take home the handsome clock he had won.

Mr. Knowles considered all had done well and they had had a delightful time. He was very well pleased with his prize.

Mr. McVay gave thanks to all who had been instrumental in providing the afternoon's enjoyment. It had been to him a great pleasure to meet once more so many of the members' wives and other visitors. When he came he had no idea of winning a prize—it was the first he had won—he could now look forward to winning others.

Mrs. Crossland said she was delighted at having won the handsome prize presented by Mrs. Robinson, the wife of the president, and she would certainly come again—though they would handicap her in any future ladies' event.

Mr. Westgate said he had attended the gatherings on several occasions, and expressed his pleasure at the way he was made welcome. He had known the president some time, as he met him when he first came to Manchester. He thanked the Council very much for the prize, and would tell them that he made up his mind before he came that he would win it.

Mr. Watson, on behalf of the visitors, expressed thanks for the way in which they had been entertained, and was sure that all the visitors thoroughly appreciated the effort.

Mr. Westgate then seconded the vote of thanks.

Mr. Winstanley thought they all had thoroughly enjoyed themselves, and that the thanks of all were due to those who had provided the afternoon's entertainment—prize givers and others.

Before closing the meeting, the president said he once more wished to tender his thanks to all for coming, and, if the prizes had given pleasure, the gratitude was his, and he was ready at all times to do what he could. Nowhere had he met the "Hail fellow well met" spirit as it was displayed in the Manchester Centre. The true spirit of the P.M. and O.A. was one of brotherhood, wherein all should be brothers. He had thought that the experiences of the War had created this spirit and destroyed the autocratic mind, but he had recently received disillusionment on this point. Anyhow, he would at all times fight hard for the principles of brotherhood, but he must have the help of all members—one brotherhood for the P.M. and O.A.—though their positions in business differed. Some might be high, some might be low, but all must act as true members.

SEELEY CUP.—The final for this event will be played in Manchester between Liverpool and Yorkshire on Saturday, September 29th, at 3 o'clock, on the green of the Newton Heath Bowling and Tennis Club, Ltd., Claremont-street, Thorpe-road. By kind permission, members, ladies and friends may obtain refreshments during the game. Tea will be provided at the café of the Failsworth Industrial Society, Ltd., Church-street, Newton Heath, at 6 o'clock. WEE MAC.

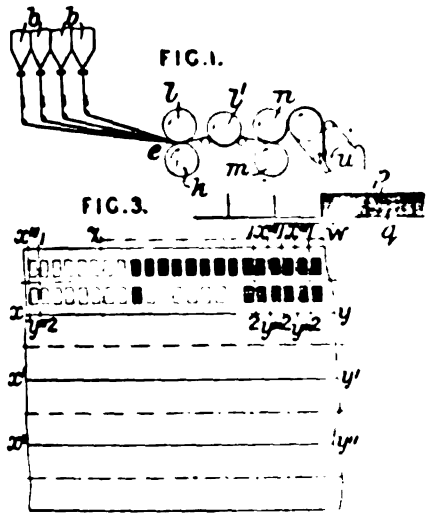
Organising Master Printers.

North-Western Alliance Activity.

The Federation of Master Printers is giving special attention to the organisation of the master printers of the North-Western Alliance (Cumberland and Westmorland), and Mr. L. J. Cumner of the Federation staff is at work in the area. All the printers, both members and non-members, in the Whitehaven District have been visited. The Association includes Whitehaven, Workington, Maryport and Cockermouth, as well as a number of adjacent villages.

The annual meeting of the Association was held on Friday, September 7th. Useful discussions took place on the questions of price-cutting and estimate variation, and suggestions were made for the holding of regular monthly meetings of the Association. On the proposition of Mr. T. T. Moss (W. H. Moss and Sons, Ltd.), Mr. A. Smith, junr. (Messrs. Smith Bros., Whitehaven, Ltd.), was elected president.

Mr. J. R. Williams (*Whitehaven News*), was re-elected secretary and treasurer. It was agreed that the president and secretary should interview and call an informal meeting of the four printers in Maryport, and arrangements were also made for dealing with certain difficulties in Workington. It is felt that the Association has taken on a new lease of strength and usefulness.



Mr. Cumner has been visiting the printers of the Kendal district during the early part of the present week, and it is hoped shortly to arrange a gathering to meet Mr. W. B. Wykes, vice-president of the Federation. Carlisle and Barrow will be visited in due course.

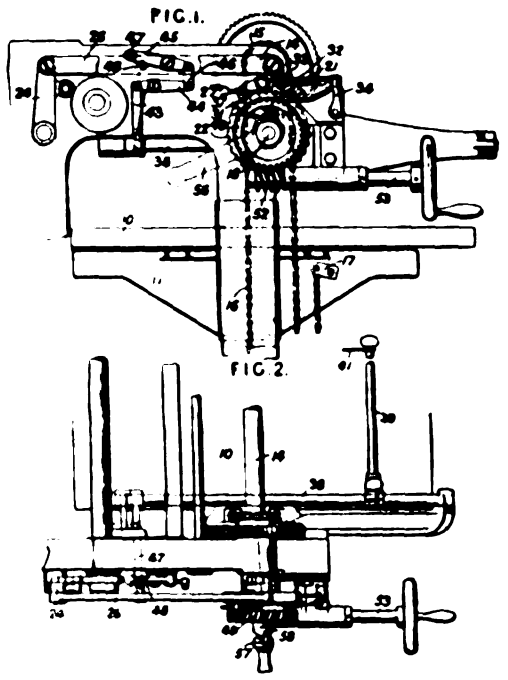
New Inventions

A Bookmaking Machine.

Apparatus of a novel character for the rapid production of printed books is the invention of Mr. H. Mainguet, of Paris, and consists of the combination of delivery, associating, cutting, stapling and stitching appliances, by means of which books are formed from a printed web by slitting the web longitudinally into strips, which may be folded



longitudinally or not, superposing the strips, stitching them with thread or wire or both transversely, cutting them transversely in the centre of two lines of stitching, and folding them transversely along the lines of stitching so as to produce book sections made up of interfolded elements stitched or stapled together. Or, the superposed strips may be merely cut transversely and the sections formed into books by glueing or lateral stitching. Fig 3 shows a printed web slit along

lines x, y . . x^{iii}, y^{iii} into four strips, each two pages wide. Each strip comprises on each side thirty-two printed pages between the lines z, w, which length is the circumference of the printing cylinder. The four strips are folded longitudinally by folders b, Fig. 1, superposed at e, stapled by the cylinders k, l, stitched by a cylinder l^1, cut transversely by cylinders m, n, and folded along the lines of stitching, producing book sections, as shown in Fig 5, made up of four elements of eight pages each, stitched at f and stapled at g. The transverse cutting lines are shown at x^{iii}, y^{iii}, Fig 3, and the transverse folding lines at 1, 2. The web length z, w thus produces eight book sections, each section of four elements, and each element of eight pages, i.e., a book of 256 pages. The book sections are assembled by a cylinder u in the cells p of a conveyer q. In the modification shown in Fig. 7, the four slit and folded web strips are merely severed transversely by cutting cylinders s, r into four-page elements, which pages are of double size, as shown in Fig. 6. In this case, books made up of 32 elements, each of four pages, are assembled in the cells p of the conveyer q.

Feeding Sheets.

In an invention by the American Type Founders' Co. sheets are fed to printing presses from a pile which may be raised by automatic mechanism controlled by the height of the pile, or the pile can be raised independently as desired by manual devices operating through a one-way clutch and gearing

so arranged that the friction of the gearing is normally sufficient to hold the table in its raised position, but is not sufficient to do so when the table is given a lowering motion. As shown, the pile table 10 is supported by vertically guided brackets 11 carried by chains 16 passing over sprockets 15, the loose ends of the chains depending from the sprockets and being held by members 17. The sprockets 15 are mounted on a shaft 14 geared to a shaft 18, which is capable of being operated automatically or by hand. The automatic means comprise a ratchet 22 operated by a pawl 27 on an arm 21 freely mounted about shaft 18, and oscillated in unison with a cam operated arm 24 by means of a link 26. A pawl 29 prevents backward motion of ratchet 22. The raising means may be held out of action when the pile is at the required height by a pin 47 on a lever 45 controlled by a feeler 41 on an arm 39 connected to a shaft 38. The shaft 38 transmits its motion to the lever 45 via lever and link mechanism 43, 44, 46, Fig. 1, and the pin 47 acts on a pin 48 on link 26, and prevents the action of the arm 21 when the pile is sufficiently high. The shaft 18 may also be operated as desired by a worm 52 on a hand-operated shaft 53 and a worm-wheel 49, which drives shaft 18 through a uni-directional roller clutch, or the shaft 18 may be driven directly by a crank 56, which can be moved axially to cause a notch 57 to engage a bevelled tooth 58 on the wheel 49. The automatic drive may be put out of action when desired by engaging a plate 31 pivoted at 30 by a catch 34. This plate raises pawl 27 out of action by action on a pin 37 on the pawl, and the locking pawl 29 is also raised out of action by a crrcular aperture 32 and a pin 33, the aperture being of such a size as to allow of the normal motion of pawl 29. It is stated that the pitch of worm 52 is such that when the pawl 29 is out of action the friction between the worm and wheel is sufficient to hold the table, but if the table is given a lowering motion, the friction is not sufficient to hold the table.

Waterproofing Paper, etc.

According to an English patent (granted to Mr. F. Moeller), the material is waterproofed by treatment with thionyl chloride or sulphur chloride or dichloride in the atomised state. The liquid may be sprayed in a chamber by a sprayer, and thence carried by a pipe to the treating chamber through which the paper is passed. The circulating system contains a drying apparatus for separating sulphurous and hydrochloride acids, and a blower. The paper may be alternatively passed over a porous block saturated with the reagents; or the latter may be applied by porous rollers dipping into the liquid or by rollers sprinkled with it.

A composition adapted for waterproofing fibre tubes is formed by heating together 25 to 60 parts of gilsonite, 25 to 70 parts of paraffin and 5 to 10 parts of petroleum oil. The mixture melts at 50 to 65 degs. C.—American patent granted to Messrs. G. A. Richter, W. B. Van Arsdel and D. H. White.

U.S. patent, granted to Mr. W. Hoskins, relates to waterproofing paper. Insoluble soap, *e.g.*, calcium or zinc stearate or resinate, is sprinkled or dusted on the surface of paper, and all except the adhering particles are then removed.

The following summaries relate to patents granted for waterproofing paper, etc.:—

A paper stock which can be felted on a paper machine is formed of fibrous pulp and a waterproofing emulsion which may contain asphalt or coal tar pitch, clay and water.

A waterproofing composition adapted for use on paper is formed of an aluminium soap, albumin, zinc oxide, and carbon tetrachloride of gasoline.

A waterproofing composition for paper containing paraffin, rosin and magnesium sulphate.

A mixture of pasty Hydrosme revieri (0·4 to 0·7 per cent. aqueous solution), $0{\cdot}2Na_2CO_3$. $NaHCO_3.2H_2O$ and 6 parts of cupric ammonium arginate solution (5 per cent.) is painted on strong paper and dried.

A strong and waterproof paper is manufactured by treating thin Japanese paper with a solution of 375 g. of Chondrus collatus, 18·8 g. of flowers of zinc, 75 g. of wood pulp in 9 litres of water, and then rolling through hot rollers.—A. P.-C.

Paper Sizes.

More Arguments in Favour of Simplification.

A further contribution to the discussion on paper standardisation is made by the book and magazine sectional committee of the general committee which was appointed by the Department of Commerce, Washington, to investigate the size and grade situation in the manufacture and use of printing paper.

Vast Range of Widths.

The latest statistics available through the Federal Trade Commission, Department of Commerce, and the American Paper and Pulp Association, show that slightly over 1,000,000 tons of book and magazine paper are produced annually in the United States, in which production there are utilised 258 book papermaking machines, ranging in width from 56 in. to 196½ in., and having a total estimated capacity of 3,849 tons per 24-hour day. A quick mental analysis of this vast range in widths implies immediately to our minds the vast changes that have taken place in the past 50 years in the development of papermaking machinery, and the total lack of standardisation, as well as the variations of opinion as to the flexibility of these machines and what is the best practice as to width sizes. It must be remembered that papermaking machines are of tremendous proportions as to length and take up considerable space and investment in paper mills, and determine the contributory factors, such as water, pulp conveying devices, digesters, beaters and all the elements that enter into the securing of the finished product, namely, paper in rolls. From this basis the recommendations contained in this report must originate.

Over-Equipment.

The statistics given in the report show that there are many more violations of the recommended standard sheet and roll width sizes in the magazine field than now exist in the jobbing or commercial fields, which in turn accounts largely for the conditions reported in the printing industry by the committee on elimination of waste in industry, when they stated that "the United Typothetæ of America by actual survey throughout the country estimated the over-equipment of printing machinery at from 50 to 150 per cent., representing hundreds of millions of dollars of idle equipment," due to a large extent to lack of standardisation.

In another part of the report on waste in industry it is stated that at one time there were 60 different sizes of a certain type of machine, but through exhaustive research and with the help of the paper manufacturer, publisher, printer, and binder, this has been reduced to six sizes to meet all practical needs, thus simplifying and economising the production of printing and binding, as well as eliminating waste in material and human effort.

The information compiled shows that there are to-day 441 different sheet sizes and 93 different roll widths of book paper being used in the magazine publishing field alone.

Standardisation of Machine.

The committee's idea in submitting the detailed reports has been to so arrange these varying page sizes into groups that they will fit into the range of the suggested sheet sizes and thus carry back, by the slightest variations, while still retaining their general appearance, this standardisation to the paper machine itself. The present conditions appear to be unintentional, arising from a lack of guidance and as a result of custom which has been crystallised into habit and needless prejudice, but these objections can be removed by education and appeal to self interest and the benefits to be obtained. Certainly the advantages far outweigh the drawbacks.

The most economical or ideal production of book paper would be with the elimination of all orders requiring less than a 24-hour run of a paper machine, which would amount to from 20 to 25 tons per day, depending upon their minimum special direct-making-order trade customs to a 24-hour machine run for a size and weight. Through a reduction in the present wide variety of paper sizes substantial savings would be made in the cost of printing, printing machinery manufacture as well as in paper costs.

Guides for Orders.

Those sizes and roll widths given in the recommendations should therefore be used as guides for the elimination of paper orders that call for less than 25-ton orders or a 24-hour run for a book paper machine of the ordinary type.

It is also to be remembered that while to the large users of paper who are in a position to have their paper manufactured specially for their own requirements, the full weight and purport of this report will not be of immediate concern, it should be realised that the benefits to be derived from a general standardisation of various printed forms would result in great benefits to advertisers, lithographers, machine manufacturers, printing production generally, as well as in papermaking machines for paper mills.

Therefore the committee wishes to submit its recommendations for sheet sizes in their single and doubles, as well as rolls, as outlined in the accompanying table, in which are given a broad range of untrimmed page sizes that will cut to advantage from the sheets as given, and will be the first step toward effecting the savings that are possible by adherence to this programme.

Untrimmed sizes are given because of the lack of standards in trimming and also because of variations in trim due to some publications being side-wired and others saddle-stitched. The average trim off the above sizes is ⅛ inch off head and ¼ inch front and bottom.

The four sizes included in this list, 26 x 29, 25 x 38, 32 x 44, 34 x 45½, and their doubles, are the sizes the committee on simplification of paper sizes has recommended for general printing use and for jobbers to stock.

RECOMMENDED SHEET SIZES AND ROLL WIDTHS FOR UNTRIMMED PAGE SIZES.

Sheet Sizes — Single.	Sheet Sizes — Doubles.	Untrimmed Page.	Untrimmed Page.	Untrimmed Page.
	37 x 49		6⅛ x 9¼	9¼ x 12¼
26 x 29	29 x 52		7⅛ x 13	13 x 14½
25 x 38	38 x 50	4¼ x 6¼	6¼ x 9½	9½ x 12½
28 x 42	42 x 56	5¼ x 7	7 x 10½	10½ x 14
28 x 44	44 x 56	5¼ x 7	7 x 11	11 x 14
30½ x 41	41 x 61	5⅛ x 7⅞	7⅞ x 10¼	10¼ x 15¼
32 x 44	44 x 64	5½ x 8	8 x 11	11 x 16
33 x 46	46 x 66	5¾ x 8¼	8¼ x 11½	11½ x 16½
35 x 45½	45½ x 70	5 11/16 x 8¼	8⅞ x 11⅞	11⅞ x 17½

ROLL WIDTHS.

25, 28, 30½, 32, 33, 35, 37, 38, 41, 42, 44, 45½, 46, 49, 50, 56, 61, 64, 66 and 70.

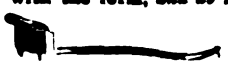
Future of Riordon Paper Co.

Under the plan of reorganisation of the Riordon Co., says the Toronto correspondent of *The Times*, the capitalisation of $47,000,000, representing $10,000,000 of eight per cent. first preferred, $10,000,000 of seven per cent. preferred, and $27,000,000 of common stock, will be reduced to $10,000,000 of seven per cent. cumulative prior preference shares, $5,500,000 of seven per cent. preferred, and 600,000 shares of common stock of no par value.



Funded and other indebtedness will be reduced by $15,000,000. The new plan is apparently regarded by bankers as adequate, and with a strong board of directors, headed by Senator Curry, the future of the company is regarded hopefully.

Spicers Limited.

Profit in First Year of Complete Amalgamation.

For the twelve months to the end of March last—the first complete year since the firms of Spicer Brothers and James Spicer and Sons were amalgamated—Spicers Limited announce a gross profit of £391,108, which, with £75,098 brought in, makes a total of £466,206. Deducting £314,923 for salaries, rates, taxes, directors' fees, etc., there remains £151,273. Debenture and note interest together require £28,654, and the interim dividend on the preference shares took £16,250, leaving a disposable balance of £106,379. The balance dividend on the preference shares again requires £16,250, and the directors propose to pay a dividend of 4 per cent. for the twelve months on the ordinary shares. This will absorb £20,000, and will leave £70,129 to be carried forward.

The directors explain that the accounts are issued later than usual owing to the large amount of work in connection with the amalgamation. The two concerns, it appears, are not yet by any means so merged as to show the economies and advantages that are ultimately to be gained. In addition to this the general depression in trade, both in this country and throughout the world, continues to have a considerable influence on the company's operations.

Since the close of the financial year all the 8 per cent. notes have been extinguished. A new issue of 5½ per cent. notes was made in November last, and the effect of this reduction in the rate of interest and the amount issued will, of course, be shown in the next balance-sheet.

For 1922 a dividend of 1½ per cent., actual, was paid by way of interim on a capital of £250,000, and 3 per cent., actual, as a final dividend on the increased ordinary capital after the amalgamation.

At the general meeting of Spicers Limited, held on September 7th, the chairman, Mr. H. G. Spicer, said that in regard to Australia the Preferential Tariff in favour of newspaper made in the United Kingdom had been a great help to "news" mills in this country by enabling them to keep fully employed.

In view of the grave difficulties that most mills in this country were experiencing in regard to keeping running, this extra Preference was for "news" mills a real help, and he hoped that the principle would be extended in Australia to the other mills in the United Kingdom making other grades of paper, because he was convinced that on lines such as these, of commercial reciprocity within the Empire, unemployment would be solved and the end of trade stagnation hastened.

Last year he had said that some considerable time must elapse before economies in connection with the amalgamation began to reveal themselves in any substantial way. The selling organisation of the company was thorough, and they were exerting all their energy to get what business was about; but the competition for the little business there was was very keen, and in these times of chaotic financial conditions in certain European countries, the company felt a lot of extra competition in this free market on that account as well. They could not expect the paper trade to be brisk till the general trade of the country revived. General trade was still bad; a lot of the home needs were being supplied by the foreigner, and the home factories were running, in consequence, short time, with the result that there was a large amount of unemployment and doles thrown on the rates and taxes.

He repeated what he said last year, that if they could be free of strikes, if there was a willingness among the workers to accept the wages an industry could afford, and if unfair competition and dumping stopped, then things all round would soon be different and improved. This was what they must look for, hope for and work for.

NEW ZEALAND TARIFF.—Under the new schedule of the New Zealand Customs duties paper and stationery, millboards (in sizes prescribed by the Minister) are now free under the three tariffs.

Ewart and Collis, Ltd.

An adjourned extraordinary general meeting of Ewart and Collis, Ltd., was held on September 7th at Winchester House.

The chairman (Mr. S. W. H. Blake) said that the meeting was really a continuation of that held on July 11th last, which was adjourned in order that negotiations then taking place might be continued, in the hope that those negotiations would lead to the sale of the remaining assets, and so allow of the distribution in specie of the shares held by this company in Ewart and Son to the shareholders intact.

The board had put forward a provisional contract for the sale of the Sunbury works, plant, machinery and stock, and their interest in the lease of Regent-square. The draft of this contract had been approved in substance by both parties, and was in the hands of the purchaser's solicitor, and there was little doubt that it would be executed in the course of a day or two. The board had every reason to believe that when the refund of overpaid income-tax, etc., had been made, the price obtained for the remaining assets would cover all liabilities, and so enable the shares in Ewart and Son to be distributed intact, and it was expected that the dividends on the shares of Ewart and Son, which had been placed to a special account at the bank, would also be paid out to the shareholders in full.

A resolution was passed authorising the directors to take steps in regard to the proposed distribution in specie of the shares held by the company in Ewart and Son on the understanding that if the intended contract is not signed and exchanged within 21 days the board will forthwith convene the necessary meetings for liquidation of the company.

The chairman stated that on the execution of the contract the shareholders would be notified.

THE address of Messrs. D. Van Huiden, Holland, is now 30, Wouwermanstraat, Amsterdam.

Direct Paper Supplies.

Negotiations Between Printers and Wholesale Stationers.

As previously mentioned, negotiations are proceeding between the Joint Committee of the Federation of Master Printers and the National Association of Wholesale Stationers and Paper Merchants on the question of direct paper supplies.

The proceedings are being carried on with a mutual desire to closer co-operation, and an atmosphere of good will is being created which is likely to have the most favourable results on both sides, says the Federation *Members' Circular*.

Paper for Duplicating Machines.

Discussions have centred round the much-vexed question of paper supplies in cut sizes for use with duplicating machines. The printers' representatives held the view that these machines cannot be considered as an "operative printing plant" and that paper supplies for them should come through the printer and not through the wholesale stationer.

The Wholesale Stationers said that even if this were admitted so far as it concerned the owner of, say, one or two machines, they felt that where these were used in larger batteries the size of orders might be of such proportions that the printers would have little or no chance of getting them. This would let in the smaller agent or dealer not holding stocks but who could supply direct, getting his paper from mill stock or any other available source to the detriment of both wholesale stockholders and printers.

It was agreed that the printer should have every opportunity of obtaining this trade, and consideration was given to the means by which this should be accomplished—whether by a special price allowance to the printer or by the wholesaler refraining from quoting.

It was eventually agreed that the wholesalers should assist the printer in every way to take these orders and that the printer should keep in the closest touch with the wholesaler so that the assistance might be mutual, the matter to be re-discussed after experience had been gained.

It must always be borne in mind that the wholesaler holding genuine stocks at the disposal of the printer has his own troubles to face in the way of competition by outside firms, and it is only by the printer confining his business in paper supplies to the stockholders that the difficulty can be overcome.

Paper in Eastern Europe.

Difficulties of Carrying on Commerce.

The economic life of Austria has been much affected by the fall of the German mark, followed by that of the Polish and Hungarian kroner, also by the rise of the Bulgarian lews. All calculations are thus upset and many a promise of modest profit proves to be some loss.

The Austrian export trade is to-day more difficult than ever, which is a serious fact since the Austrian paper industry has to depend on the foreign market. The inland customers are too few for the large production. The export to the West is much handicapped by the occupation of the Ruhr zone by the French. In France and Belgium the Austrian agents must reckon with the deep antipathy against anything resembling or being German.

In both countries the Czecho-Slovakian paper is preferred at present, chiefly for political reasons. Material from the northern nations is also much in demand. The Norwegian, Swedish and Finnish mills maintain in France and Belgium consignment stocks from which the customers there can be quickly supplied. The Austrian factories cannot maintain such stocks, they cannot even accept the payment conditions of the customers there unless they are well supplied with capital. The French and Belgian buyers wish to pay only after having received the wares, most even demand some extended credit. This, of course, is out of the question to the impoverished Austrians.

In Great Britain the Austrians have to face German competition, for the German firms supply very cheaply. Compared with the latter, the Austrian firms are at a disadvantage since the transport to England is dearer and more cumbersome. Austrian exporters can choose the way *via* Trieste, but this is too far for Atlantic and British ports, and besides higher freight charges, the goods have to be packed seaworthy. When shipped *via* Hamburg to England simple wooden boxes are sufficient since the way is short and steamers leave there almost daily. The English customers prefer to buy in Hamburg and grant even a somewhat higher price.

Much more favoured as regards transportation are the firms in Czecho-Slovakia. These send their products down the Elbe *via* Dresden to Hamburg and from there to any part of the world. The paper made there is favoured when entering France or Belgium as regards custom charges and Austrian firms endeavour to be placed on an equal level, making negotiations with France.

Just as many difficulties are encountered with the export to the East. In Hungary foreign cheques which serve as means of payment are given to the importers insufficiently so that they cannot even pay their old debts. After their laws the so-called sales tax must be paid at first at the frontier and then a second time when the goods are put into circulation This double tax acts like a high protective tariff. The economic policy appears to be more confused every day; no wonder that the Hungarian crown is sinking.

In Southern Slavonia and Roumania the traffic with other nations is much handicapped. There are domestic or inland dinars and foreign dinars; in Roumania there are free and restricted accounts of leis, and it lasts sometimes months until the foreign seller receives the actual cash. He suffers many losses since the value of the lei falls.

In Bulgaria the rapid rise of the lews has disturbed the economic life. Although one appreciates the higher value of the national coin, it takes some time until the various economic circles get accustomed to it. The prices for everything go down. The foreign sellers with credit accounts in lews must reckon with some deductions. Generally that country is quite a good market for paper, for the trade and industry is improving.

Printing and Allied Trades Football.

Prospects for the Coming Season.

The wide vogue now given to all kinds of sport and especially football, is becoming a subject of increasing importance. The devotees of football have become so numerous of recent years that it is not surprising that the printing and allied trades, which rank as the second largest in the Metropolitan area, should be in the forefront amongst industries in encouraging this healthy pastime. Many of the big firms of repute in various branches of trade support and maintain their own sports grounds, realising as they do the immense value of healthy sport as an incentive to the production of greater output. In this respect it is satisfactory to learn that many leading representative printing firms in and around London are again making preparations for the coming season.

The arrangements that have to be made for the large number of competing clubs and the many matches that have to be played throughout the season involves a great amount of work. All this is voluntarily undertaken by the Football Section of the Printing and Allied Trades Charity Sports Association, of which Mr. George H. Marks—of the well-known Holland-street Metal Foundry—is the hon. secretary. Mr. Marks' aim in occupying this position is not only to encourage clean and healthy sport, but to help propagate the best possible relationship between employer and employee. In this endeavour he deserves the co-operation and sympathy of all engaged in this means of seeking the welfare of the industry.

Owing to Mr. Marks' recent absence from town on business for his firm, the preliminary arrangements for the coming season have been in the experienced hands of Mr. V. Bowman, the chairman of the Section.

With its enterprising hon. secretary back again and a strong and influential committee supporting him, there is no reason why the programme to be inaugurated in 1923–24 should not be even more successful than its predecessors. The season commences early next month and Mr. Marks would be pleased to hear from interested members of the trade at Fry's Metal Foundry, 25–40, Holland-street, Blackfriars, S.E.1.

Paper Trade Golfing Society.

Autumn Meeting.

The autumn meeting of the Paper Trade Golfing Society will be held at Hadley Wood Golf Club, on Tuesday, October 9th, when the following competitions will be held:—

Morning: The Foursome Challenge Cup; Bogey Competition.

Afternoon: Captain's Prize; Stroke Competition open to handicaps of 11 and under. The Cardiff Cup; Stroke Competition open to handicaps of 12 and over.

The meeting promises to be a great success, and entries must be received not later than September 30th.

Spicer Challenge Cup.

The following members have passed into the second round of the competition for the above: Mr. E. Burton Fiske, Mr. J. Woodhouse, Mr. N. H. Leander, Capt. Noel V. Bowater, Mr. A. S. Batchelor, Mr. F. A. Skerratt, Major Frank H. Bowater, Mr. George Buchanan.

Committee.

The next meeting of the Committee will be held late in September when final arrangements will be made for the autumn matches.

Lancs Paper Trade Golf Society.

Successful Autumn Competition.

The autumn competition of the Lancs Paper Trade Golf Society was held over the course of the Pleasington Golf Club, Pleasington, near Blackburn, on Monday, September 10th, by the kind permission of the club committee. The weather was ideal and the course, which is one of the best and most picturesque in Lancashire, was in fine condition. There was a good muster of members, and the arrangements made by the club officials and steward for the comfort and pleasure of the visitors were excellent. Play commenced at 10 a.m. and a very interesting competition resulted as follows:—

The Partington Trophy and replica, won by Mr. Harold Whitehead with a score of 91-18-73.

1st Division Handicap.—1st prize, Mr. D. C. Andrew, 89-14-75; 2nd, Messrs. J. D. Russell and Chas. A. Stead tied with a score of 76 nett. After a replay over 10 holes Mr. Stead won by one stroke on handicap. Mr. Stead was therefore awarded the 2nd prize and Mr. Russell the 3rd prize.

2nd Division Handicap.—1st prize, Mr. A. Tempest, nett score 75; 2nd prize, Mr. Jack Isherwood, nett score 77; 3rd prize, Mr. Joseph Isherwood, nett score 80.

Prizes were presented by the following gentlemen: Division I.: 1st prize, silver candle sticks, by Mr. A. Parkinson; 2nd prize, silver cigarette case, by Mr. E. F. Jucker (Felber Jucker and Co., Ltd.); 3rd prize, silver cigarette case, by Mr. F. Mitchell. Division II.: 1st prize, silver fruit stand, by Mr. Knight; 2nd prize, leather-bound sketch book, by Mr. E. W. Allen; 3rd prize, silver cigarette case, by Mr. J. A. Hopson.

A WEEKLY newspaper for the blind, printed in "Moon" type, will shortly be issued by the Moon Society.

WE are asked to say that Mr. Percy C. Skelton is in no way connected with the gentleman of the same surname who appeared at the Mansion House Police Court recently. Mr. Percy C. Skelton is successfully trading with Mr. H. Murray Meek as Meek and Skelton, at 168, St. John-street, E.C.1.

IN his will which has been filed at Marion (Ohio), the late President Harding leaves to Mrs. Harding for life an estate amounting to $100,000 [£22,000], his house, and a half interest in the building owned by the *Marion Star*. The late President's aged father will receive an estate for life of $50,000 [£11,000], as well as the residence where he lives. The will directs that no part of the estate is to be used for a monument to the testator except for the erection of "a modest stone."

Paper Bag Making Machinery

(Bumsted's Patent.)

Supplied in five standard sizes, to produce from a Tube, to contain 60 pence, up to a 28lb. Raw Sugar Bag.

Superior to Hand Made Bags.

Printing attachments if required.

½ H.P. Gas Engine drives seven machines at once.

Low upkeep cost.

The most reliable Paper Bag Making Machine on the Market.

Illustrated folder giving full particulars will be sent free on request.

Stereotyping as a Metallurgical Operation.

Further Points from the Manchester Meeting of the Institute of Metals.

We reported last week a paper read before the Institute of Metals by Messrs. A. H. Mundey and John Cartland, M.C., M.Sc. (both of Fry's Metal Foundry) in which the important subject of stereotyping as practised in the printing trade was brought before the attention of leading metallurgists. The paper aroused much interest at the meeting, and has, we know, been read with avidity in the columns of this journal. We are able this week to add a few points from the discussion which followed the reading of the paper, and also to give further particulars of an interesting new machine referred to.

Faulty Methods in the Printery.

Dr. Walter Rosenhain, F.R.S., was the principal speaker in the discussion. He congratulated the authors on the paper, which he said was an interesting one on a subject of great importance. There were still many problems of metallurgical interest in the stereotyping process. He recalled that he had been called in to the office of a great London daily newspaper, in about 1908, on account of serious trouble with the stereotype metal. He found the conditions most unsatisfactory—the absence of any control of temperature, the want of care in handling, and of precision with regard to composition. Really it did seem astonishing that the printer was able to obtain satisfactory results at all, considering the metal which he frequently used, and the ill treatment to which he subjected it. It would be a good thing if a much better grade of metal could be introduced. The printer seemed to be entirely governed by price in his choice of metals. The alloys used were lead base metals with tin and antimony in variable quantities. It seemed to him that if a much higher grade ternery eutectic alloy could be employed, much better results might be obtained. Dr. Rosenhain recommended the study of the alloys, and trusted that some of the younger metallurgists might be induced to construct an equilibrium diagram of the ternery alloys of this nature. It should not be difficult, as materials of the experiment and the apparatus should not be inordinately expensive and the temperatures were all comparatively low.

Recent Progress in Methods.

Mr. A. H. Mundey, on behalf of Mr. Cartland and himself, thanked the members for their reception of the paper, and particularly Dr. Rosenhain for his remarks upon it. It was admitted that there had indeed been grave ill usage of the metals in times past by the printers, but he could assure Dr. Rosenhain that now practically every great newspaper office and important general printer had pyrometric control over all his melting operations, the pots generally having pyrometers with a master instrument in the manager's office, a practice which had also a wonderful moral effect, especially considering that so much of the work is done during the night. The composition of the alloys was now controlled by constant check analyses, and the cleaning and purification received the utmost attention.

He referred to the immense amount of anxiety which occurred in the printing office, when things went wrong. A few months ago in a Glasgow newspaper printing office, difficulty arose with the plates not bedding down on to the cylinder. The case was even worse than his friend Mr. Cartland had said, for not only did the printing become irregular and unsatisfactory, but the paper was actually torn and damaged, yet the plate was only 100th of an inch out, and the trouble was entirely a question of irregular cooling, but it kept many of the staff up night and day to overcome the difficulty. Mr. Mundey said that with regard to the ill-treatment of the metals, perhaps that was so, but certainly the metals did respond to severe treatment, for instance in the production of one of the most notable illustrated daily papers in London the stereotyper took the utmost advantage of the separation of antimony-tin soft solid crystals on cooling, and actually cast the plates in an alloy of the consistency of thin gruel. With a eutectic this would be impossible. The lead-antimony eutectic was regarded as the lazy man's metal, but did not yield good results. Mr. Mundey remarked that it was worth noting that the stereotyping in the British Isles was the envy and admiration of the whole world. A party of distinguished American printers and newspaper men had admitted that whilst they were proud of their electrotyping, their stereotyping was not up to the standard of English practice.

Who Invented "Flong"?

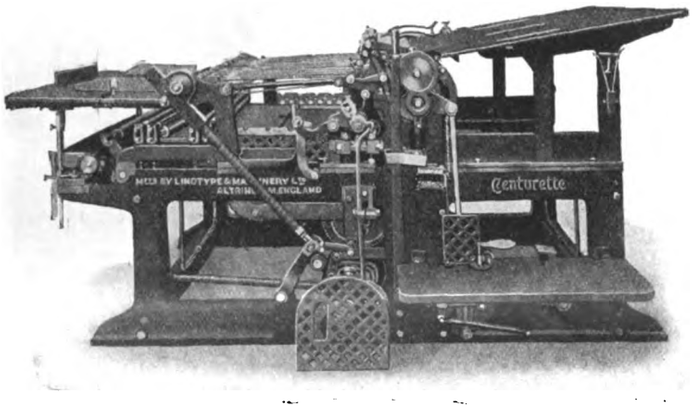
With regard to the passage in Messrs. Mundey and Cartland's paper in which the invention of "flong" is attributed to Wilson in 1823, we learn that Mr. Mundey has received a note from Mr. G. E. Holloway, managing director and secretary of Messrs. B. Dellagana and Co., Ltd., claiming that it was the house of Dellagana that introduced "flong." The bibliography of stereotyping is rather meagre and it is perhaps difficult to establish this point beyond question. We should be interested to hear from anyone able to adduce reliable evidence on the point.

Winkler Automatic Plate Casting Machine.

We are able herewith to illustrate the Winkler machine to which Mr. Mundey referred, also to supply a fuller description. This machine embodies a number of exclusive features and new principles, adapted to produce perfectly true and solid newspaper stereo plates (1) without "tail," (2) without the use of pumps, (3) without subsequent shaving, (4) without trimming or hand-finishing, (5) without any dummy castings (or "heaters"). In other words, after a short automatic operation, independent of the skill of the operator, a perfectly finished stereo plate is produced, which is absolutely ready for the press and does not require any make-ready.

The fundamental idea in designing the "Winkler" was to connect the casting box directly with the melting pot in such a way that the stereo plate is cast without a tail but under the weight of the whole contents of the metal pot, by gravity, at a pressure most suitable for obtaining a perfectly true and solid plate. This feature is patented.

The machine consists of a melting furnace with arrangement for heating by either electricity, gas, coal or coke; a hood; a cock with automatic lubrication; a pyrometer; a casting box comprising casting shell (or bed), core (or mandrel), matrix clamping arrangement, two rings (adjustable if desired), eccentrics and return-cranks to slide the casting shell upward and downward, and automatic water-cooling arrangement for shell and core; and enclosed driving gear with motor and starter.



The furnace has a flat, vertical rear side and can therefore be conveniently placed against the wall. The furnace door is about 3 ft. above the floor and therefore permits of very convenient stoking and attendance.

The melting pot is wedge-shaped, and has at its lowest position an outlet-slit (mouthpiece) through which the metal flows into the casting box when the cock is open. The capacity of the melting pot is 2,650 lbs., which is equal to 47 plates of *Daily Mail* size weighing approximately 56 lbs. each. By feeding one old plate into the melting pot for every plate cast an indefinite number of plates can be produced in continuous uninterrupted operation.

The hood covering the melting pot is strongly made and counterbalanced to facilitate easy opening and closing. It is

provided with a self-closing door for convenient feeding of the pot and with a connection to the flue, so that the fumes from the metal are carried off with the products of combustion. By means of this hood the surface of the molten metal is kept in a non-oxydising atmosphere which reduces the formation of dross to a minimum.

The cock is a device for alternately opening and closing the mouthpiece in the metal pot. It is a thick cylindrical bolt extending over the whole width of the pot and provided with a twin bevel of about plate width, which allows the metal to flow into the casting box. In the first momentary stage of the casting operation the metal in the pot and in the casting box therefore forms one single liquid mass. The whole contents of the metal pot serves as a tail, thus exerting a comparatively high pressure and ensuring perfectly solid plates. An automatically actuated oil pump adequately lubricates the bearing surfaces of the cock, giving a fine film of oil without excess.

The casting shell and core are arranged separate from each other, and are both water jacketed. The casting shell is actuated by cranks, and as soon as it is pushed against the core the complete box, which is now well closed, is tightly pressed against the mouthpiece of the metal pot. At this stage of the operation the cock is automatically opened and the plate cast. The cock cannot open unless the box is fully closed and tight up to the mouthpiece of the metal pot, so that there is no risk of splashing or spurting. After allowing a few seconds for the metal to solidify, the cock automatically closes again, and, whilst turning, severs the freshly-cast plate from the contents of the meltiug pot, the opposite edges of the bevel in the cock and of the mouthpiece being constructed as knives. As soon as the mouthpiece is closed the casting shell and the core slide back to their original open position, thus completing the cycle of the automatic operations of the machine. Owing to the special shape of the head and foot sticks the plate is now separated both from the matrix and the core, but held in such a way that it can be conveniently taken off.

The matrix clamping device is a patented feature, which permits the matrix to perfectly adapt itself to the wall of the casting shell in all directions. The matrix is placed in the casting shell in the usual way, but when once set its head is clamped to the casting shell and not released until all the plates required from that matrix are cast. The foot of the matrix is held by a foot stick and the sides by the two rings, in such a way that expansion and contraction (if any) can take place freely.

The rings can be made adjustable (if desired), so that the machine will cast plates of a varying number of columns. The rings are attached by screws at the foot of the casting shell. For inserting the matrix, the rings are simply raised and clipped to the core.

The water cooling of the core and the shell is automatically controlled, according to a patented system, which is the outcome of close calculations and lengthy experiments. The valve-controlled adjustable water circulation automatically starts as soon as the machine is set in motion, and ceases when it comes to a standstill.

The melting pot can be heated by electricity, gas, coal, or coke. Most "Winkler" casting machines are electrically heated,

Zinc and Copper Process Plates

some with a separate gas heating attachment, which can be used either independently or conjointly with electricity. When electric heating is used, the temperature of the metal is thermostatically controlled, thus obviating overheating and burning of the more volatile parts of the alloy. Any desired degree of temperature can thus be maintained. An electrically wound clock automatically switches the current on and off at set times, when it is desired that the heating commences and ceases. For this purpose the pointers on the dial-plate can be set at will.

The Winkler Casting Machine, Showing Mould Open and Plate Ready.

The machine is driven only at one speed by a direct-geared 2 h.p. motor. An automatic starter is supplied as a standard equipment with each machine.

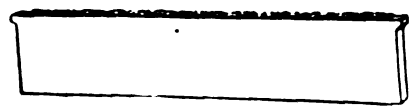
The only work done by hand is: Setting the matrix (once only), starting the machine (by foot pedal), removing the finished plate. Everything else is done automatically by the machine.

The operation of the machine requires one man only, and a special engineer is unnecessary.

A sectional view of the Winkler casting machine, showing metal bath and plate in mould, will be found on a later page.

NEWSPAPER PHOTOGRAPHIC REPRODUCTION.—*The Times* calls attention to an innovation in its illustrated page department, which it claims marks a definite advance in stage photography. Hitherto, the nearest approach to taking a stage photograph, suitable for newspaper reproduction, with the ordinary stage lighting, had been with the Grun lens, which required an exposure of about two seconds. Recently, the photographers of *The Times* have been able to take several instantaneous photographs during theatrical performances, and recently an illustration was printed of a scene at Covent Garden, which was reproduced from a photograph taken from the dress circle with an exposure of one-tenth of a second. An important potentiality of the development is the probable elimination of flash-powder in this branch of photography.

To Eliminate Electrotyping.

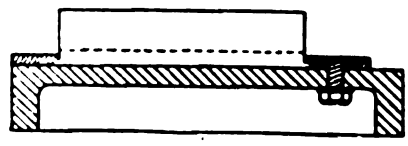


Interesting American Method.

However plausible they may appear on paper, novel methods in respect of printing procedure need to be substantiated in actual practice before they make much appeal to the British printer. Of the method described and illustrated below it is stated that it has already been successfully adopted in America by the Houghton Mifflin Co., the Haddon Press at Camden, the Murray Printing Co. of Cambridge, Georgo H. Ellis Co. of Boston and the University Press of Cambridge. The following is an account which appears in the *Publishers' Weekly* of New York:—With the increasing pressure of book costs, efforts to simplify the procesees between the manuscript and the completed book are of special importance to the trade, and this adds interest to a description of the machinery designed by the Litchfield Linoplate Co., which, if the statements of its inventor and of those who have begun to use the process can be borne out by wide trial, may prove an important book-making development.

The objective of I. W. Litchfield, the inventor, has been to find a way to avoid the necessity of electrotyping by cutting down the linotype slugs to plate height and then welding them to one solid mass. By this process it seems possible to cut in half the cost of making plates; not only that, but, what is perhaps equally important, to cut the cost of make ready to a minimum, and perhaps ultimately eliminate it altogether.

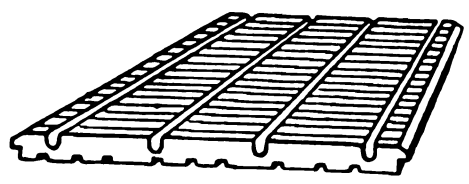
Mr. Litchfield was for many years connected with the Lamson Carrier Co. and had previously been a practical newspaper printer. In working on this problem, he has been anxious to perfect the machinery so that a greater nicety of adjustment and accuracy is possible than in the ordinary plate. The process is as follows:—



The linotype slugs are cast in the regular way but with a narrow shoulder projecting at each side beyond the type face. When all the slugs are ready with their final corrections and the page proofs passed, this page of slugs is locked, face down, in a special galley, the sides of which have grooves to engage the shoulders of the slugs. The type face rests on a face of metal, whose evenness has been perfected to micrometer measurements. When locked up, the extra metal is sawed off to within one-sixteenth of the needed size. The galley then passes under a grooving apparatus that cuts five lengthwise slits in the back of all the slugs. Into these automatically drop

Slug with Shoulders at each end.

steel wires, a little liquid flux, and an electric soldering iron makes the group of slugs one solid plate.

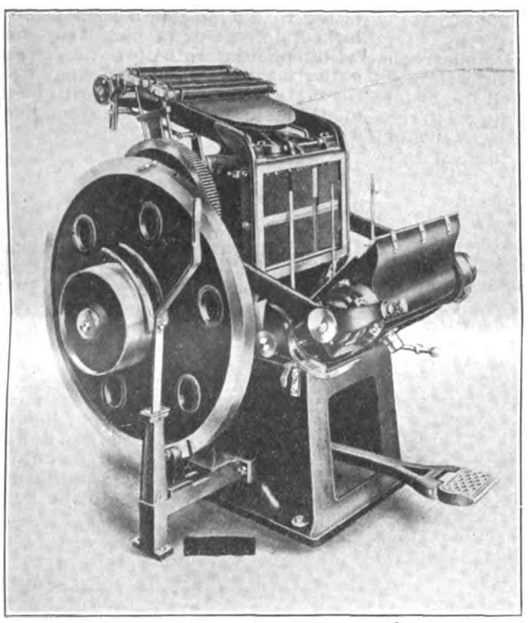


The galley then passes under two planing machines, which, without putting a pressure on the plate that would hurt its face, brings the thickness to the exact plate height. This solid plate is now released from its holder and the edges are bevelled for mounting. The whole process can be accomplished in three minutes, or twenty plates to the hour. This

Section of lockup galley or chase showing how slugs are held by shoulders.

Dotted line indicates where slugs are cut off.

method of plate-making has been going on while the face of the type is on an absolutely level surface, in contrast to the present method of handling the slugs, which is to place them on their backs while taking the wax impression for electroplating. This new method would seem to increase greatly the chances of having the face of the plate absolutely level, which is the beginning of all good printing. It is this point that brings the opportunity of cutting down the task and expense of make-ready. Taken in conjunction with the increased study which is being made of cylinder building, one can look forward to the time when make-ready will be greatly eliminated. As it is in the linoplate process the make-ready is only necessary, it is claimed, for the first form and becomes really an adjustment of the press rather than an adjustment of the plate. Once the press is adjusted, every other form is, of necessity, exactly like the first, and therefore no new make-ready is necessary.



Showing how slots are cut in slugs after being cut down. Ready for the wires and solder.

THE National Institute for the Blind is the largest publishing house for the blind in the world, and the publication of embossed books and periodicals is one of the most attractive and beneficial features of its work. The field covered is of the widest extent. History and biography, science, poetry, essays, educational and devotional works, fiction, are all well represented, and the periodicals include the *Braille Mail*, a weekly newspaper, *Progress*, a most popular monthly, the *Literary Journal*, the *School Magazine*, the *Musical Magazine* and many others. The total number of Braille publications issued in the year ended March 31st, 1923, was 227,667, and the total number of publications in Moon—an adaptation of Roman type, specially suited to the aged blind—amounted to 40,098. The very wide extent of the publishing department of the National Institute is shown by the fact that during the last seven years over one and a half million publications have been issued.

WITHIN a year Canada will be the world's greatest producer of news-print paper.

Trade Notes.

"DIRECT TRADING."—As a result of the further conference which took place last week between the Federation of Master Printers and the National Association of Wholesale Stationers and Paper Merchants, a draft circular is being prepared which will give full details of the arrangements arrived at. This is to be submitted to an adjourned meeting to be held to-day (Thursday).

THERE will be a busy time at the headquarters of the Federation of Master Printers prior to the council meeting arranged for October 9th. Many of the permanent committees are meeting to prepare their reports, the Contracts and Legislation Committee having fixed a meeting for October 1st, the Costing Committee for the 3rd and the Finance Committee for the 4th, whilst other of the committees will meet later.

CARDIFF J. I. C.—The Cardiff District Committee of the Joint Industrial Council is to be entertained on Saturday by Mr. Frank Murrell and the joint secretaries of the J.I.C., Messrs. A. E. Goodwin and A. E. Holmes are expected to visit Cardiff for the occasion.

NEWCASTLE J. I. C.—In connection with the Newcastle-on-Tyne District Committee of the J. I. C., the annual sports are being organised at Jesmond Dene on Saturday next. We understand that an interesting item on the programme will be a special race for employers, no age limit being fixed.

LANCASHIRE AND CHESHIRE PRINTERS.—The autumn week-end meeting of the Lancashire and Cheshire Alliance of the Federation of Master Printers is to be held at Llandudno from Friday, October 12th, to Monday, the 15th. The usual open meeting for the discussion of trade topics will take place on the 13th, and an invitation to take part is being extended to Federation members in North Wales. The proceedings of the week-end will include a golf competition for ladies and gentlemen, a bowling competition and a whist drive.

MASTER PRINTERS in North and East Lancashire have arranged a series of attractive meetings for the autumn session, commencing with a lecture on photo-lithography and collotype by Mr. W. Harrison, of the Manchester School of Technology, a visit to the paper mill of Messrs. Peebles at Rishton, and a visit to the Manchester College of Technology, whilst in January Mr. Vick will lecture on bookbinding costs.

AT the Shipping, Engineering and Machinery Exhibition the Lanston Monotype Corporation Ltd. were showing their "Safe-Guard Cheque Writer," the New Barrett Listing Machines, the Radbore Head Square Hole Drilling Attachment, the "Safe Economy" Electric Iron and Grip Switch Handles.

MR. EDWARD S. BELLIS, who has died at Leeds, at the age of 73 years, was a familiar figure in Yorkshire printing circles, and for 30 years was works manager of Messrs. Petty and Sons, Whitehall Printeries, Leeds. Mr. Bellis, who retired from active work about two years ago, was a Freeman of the City of Chester.

THE death occurred on the 19th inst., at Middleton, in his 74th year, of Mr. John Rogerson, late representative of Messrs. John Heywood, Ltd., and Mr. Geo. W. Lockwood.

MR. FREDERICK RATCLIFF, who has died at his residence at Amley, Leeds, at the age of 39 years, was a member of the firm of Messrs. John Ratcliff and Sons, printing engineers, Leeds.

THE late Lord Morley's brilliant record on the journalistic side of his activities included editorship of the *Fortnightly Review* and of the *Pall Mall Gazette*.

LATEST WILLS.—The late Mr. John Shaw Haigh, of Grimscar, Huddersfield, paper merchant and paper-bag manufacturer, of Messrs. Waddington and Haigh, of Huddersfield, who died at Lucerne on June 17th last, aged 62, left estate in the United Kingdom of the gross value of £108,388, with net personalty £104,031. Mr. Arthur Williams Marchmont, of Bath, barrister, formerly editor of the *North-Eastern Daily Gazette*, Middlesbrough, and the *Lancashire Daily Post*, Preston, at one time proprietor of the *Bath Chronicle*, left estate of the gross value of £15,580 with net personalty £13,896. Mr. Edwin Tunstall, of Salford, Lancs, for many years a member of the staff of the *Manchester Guardian*, left £1,020. Mr. James Samuel Clough, of Bayston-hill, near Shrewsbury, retired printer's reader, formerly of Brixton, left £1,596.

PRINTERS MENTIONED IN WILL.—To Messrs. Spottiswoode, Ballantyne and Co., Ltd., falls the somewhat rare distinction of being mentioned in the last will and testament of a poet. The late Herbert Trench, who was a poet of considerable distinction, directed his executors to publish with Messrs. Macmillan and print at Messrs. Spottiswoode's a free and fully revised edition of his book "Poems with Fables in Prose," and a selection from his poems on the model of M. Arnold's "Golden Treasury Series." Mr. Trench was a personal friend of Mr. R. A. Austen-Leigh, director of Messrs. Spottiswoode, Ballantyne and Co., Ltd.

P.M. AND O.A. LECTURE—The Printers' Managers and Overseers (Parent) Association announces that at its meeting on October 2nd members will be treated to "A Heart-to-Heart Chat" on profitable printing office management (standardisation of rules and customs, dockets, forms, etc.) by Mr. W. H. Burchell (founder and first honorary secretary of the association). Points covered by the lecture will include: How to start a System; The Costing System Simplified; The History of the Job; Trade Customs; The Imprint; Estimating; Country Competition; Profit Sharing; Apprenticeship Indenture; Work in Progress Board; The Printer's Traveller.

P.M. AND O.A. BOWLS.—The final for the Seeley Cup will be played on the green of the Newton Heath Bowling and Lawn Tennis Club, Claremont-street, Manchester, on Saturday next, September 29th, at 3 p.m. Members and friends will be able to obtain refreshments during the progress of the games and at 6 o'clock tea will be served in the cafe of the Failsworth Industrial Society Ltd., Church-street, Newton Heath.

AT the wardmote held at the Old Bailey last week for the election of an alderman for the ward of Farringdon Without, in succession to the late Sir William Treloar, some sensation was caused by a Mr. Sparling Hadwyn, who rose and said he was a corrector of the Press and that he wished to nominate himself. His name was added to those of the other candidates, but at the election on Saturday, Mr. Hadwyn received three votes against the hundreds each polled by the others.

A PROSPECTUS reaches us detailing the courses of study arranged for the session commencing this week at the City of Leicester School of Arts and Crafts. The courses relating to the printing and allied trades include: Compositors' work, monotype composition, letterpress printing, lithographic artists' work, poster designing, lithographic printing, ticket writing, writing and illuminating, bookbinding and machine ruling.

RUMOUR has it that several new provincial newspapers are about to make their appearance.

IT is stated that one London morning newspaper (not the *Daily Herald*), lost £100,000 last year.

IN view of the financial difficulties of *Justice*, the oldest Socialist journal, founded by H. M. Hyndman, William Morris, and Edward Carpenter in January, 1884, the S.D.F. Executive has undertaken to bear the financial responsibility until the end of the year, meanwhile a fund, of which Mr. W. Thorne, M.P., is treasurer, is being raised to maintain the paper further.

THE centenary number of the *Lancet* will be published on October 6th.

WITH the cessation of the *Guild Socialist*, its editors, Mr. and Mrs. G. D. H. Cole, will start in October a new threepenny monthly *New Standards*.

THE second annual outing of the employees of Messrs. G. A. Lansdown, printers, of Whitechapel road, took place on Saturday last under happy auspices. The rendezvous on this occasion being Southend.

THE *Advertising World* has changed ownership, having been sold by Mr C. R. Edbrooke to the Economic Publishing Company, Ltd., of which Sir Richard Redmayne is chairman. Among its new directors are Captain R. B. Crewdson, Mr. Barrington Hooper, and Mr. Sydney Walton.

IN referring last week to the American Bookbinders' Convention, we regret that indebtedness for information handed to us was inadvertently acknowledged to Mr. E. B. Judd instead of to Mr. F. Grey, of the Greycaine Book Manufacturing Co., Ltd.

Trade Union Matters.

LITHO PRINTERS' RULES.—A conference took place last week between representatives of the Amalgamated Society of Lithographic Printers and of the Federation of Master Printers in respect of proposed alterations to certain of the Society's rules affecting working conditions. After a long discussion the meeting was adjourned.

A MEETING was held last week between representatives of the National Society of Operative Printers and Assistants and the National Union of Printing and Paper Workers on the one hand and the Federation of Master Printers on the other, regarding the interpretation of the national agreement as it affects male learners. A satisfactory agreement was reached and awaits confirmation by the executives of the parties.

TYPOGRAPHICAL ASSOCIATION FINANCES.—The members of the Typographical Association have this week been balloted on a proposal to enforce a levy in order to raise a fund for the maintenance of the present standards of wages and labour conditions. A circular accompanying the ballot paper states: "The Executive Council, bearing in mind the abnormal expenditure entailed as a result of the dispute of 1922, have decided to request the members to vote a levy of one shilling on each week's wages earned at half or more than half of the minimum jobbing day case rate of the branch, and sixpence for each week a member earns less than half the minimum jobbing day case rate of the branch. It is proposed that the first payment of the levy should be made in the week ending October 6th, and continue in operation for six months."

GOVERNMENT PRINTING CONTRACTS AND "FAIR" CONDITIONS.—At a meeting of the Executive Council of the Scottish Typographical Association it was reported that all the correspondence in regard to a printing office that has been getting Government contracts and not conforming to trade union conditions of labour had been forwarded to the General Council of the Scottish Trade Union Congress. The secretary of the Council had reported the matter to the Controller of H.M. Stationery Office, and, failing a satisfactory reply, the whole matter would be placed in the hands of one of the Labour Members of Parliament, who will raise the matter in the House of Commons.

THE T.A. "FAIR" LIST.—At a recent meeting of the Executive Council of the Typographical Association a communication was received from the West Bromwich branch stating that it was proposed to introduce a new branch rule that only firms who employed a member for at least three months in the year should be included in the "fair" list. The Executive Council decided that with the exception of honorary members a period of three months' employment should be a condition to enable firms to be placed on the recognised list.

T.A. ORGANISER BALLOT.—The first ballot for the election of an organiser of the Typographical Association has resulted as follows: H. E. Cross (London), 2,009; A. L. Carter (Cardiff), 1,405; J. Taster (Sheffield), 1,256; G. Fulton (Manchester), 1,218; F. Berriman (Bristol), 1,064; G. F. Byrnes (Liverpool), 1,041; F. H. Tarr (Exeter), 1,008; F. Knights (Bolton), 995; E. Booth (Manchester), 936; C. B. Parkin (York), 926; C. F. Tumber (Bradford), 687; W. Cadogan (Newport), 309; C. White (Lincoln), 294. As the successful candidate must have a clear majority over all other competitors, a second ballot will be necessary.

T. A. AND HON. MEMBERS' BENEFITS.—The Executive Committee of the Typographical Association, in reply to an inquiry from the Southport branch, as to the position of an honorary member who wished to again take up the duties of a journeyman and desired to pay the difference between honorary members' subscriptions and full subscriptions so that he could be entitled immediately to out-of-work benefits, have decided to allow the member in question to pay the difference in subscriptions, but that three months' probation must be served before out-of-work benefit could be drawn.

THE title of the *Church Family Newspaper* has been changed to the *Church of England Newspaper*.

WEST & NORTH-WEST
London Master Printers' Association

Mr. W. H. Sessions on Printers' Advertising.

A very large gathering of master printers marked the opening meeting of the above Association at Westbourne Park Institute, Porchester-road, Bayswater, on Monday, the chair being occupied by Mr. J. Emlyn Jones. The outstanding event of the evening was a paper given by Mr. W. H. Sessions, of the Ebor Press, York, entitled "A Printer and His Own Advertising." Among those present were Messrs. J. J. Keliher, F. Colebrook, W. J. Mizen, A. E. Goodwin and W. Whyte.

After the reading of the minutes, which were duly approved, one or two items of correspondence were dealt with. These included letters from Messrs. M. Barnett and F. Scarsbrook regretting their absence from the meeting, and also a communication from the London Master Printers' Association regarding a new rule that was to be put in force.

Mr. King drew attention to the necessity of appointing a sub-committee from the West and North-West Association in reference to the London Costing Committee, and moved a resolution accordingly.

Mr. Sidders seconded.

Mr. Goodwin, said in order to organise London effectively it was necessary that the work be decentralised as much as possible.

Mr. Whyte suggested that for the present three members be elected from that Association.

Mr. Jones pointed out that the Association already had three of their members on the London Costing Committee, and these were agreed as the local sub-committee.

Mr. Burt next drew attention to the admirable programme which the Association had arranged for the coming season, and the president expressed the hope of a "bumper season."

The Lecture.

Mr. Sessions was then called upon for his lecture, which, as already indicated, dealt with the important question of the printer conducting his own advertising, and pointed to the most profitable way in which this could be done. Mr. Sessions went on to explain that advertisement planning fell under seven main heads, and these he put as follows:—(1) what to sell; (2) to whom to sell; (3) what the customer really wants to buy; (4) the amount to spend; (5) the methods to use; (6) what to say; (7) how to back up the advertising.

Mr. Sessions thought that one of the troubles of the printing trade was the lack of specialisation. "Printers of everything" was the advertising slogan, and too many of them tried to live up to it.

Advertising in Slack Periods.

Speaking from actual experience, Mr. Sessions suggested that the wisest course was to advertise when things were quiet, and to put forward all the ingenuity and brain power possible in honest business during a period of bad trade. He advised looking into the possibilities of new openings for printing and getting outside the sphere of competition, and also getting beyond the advertising which was merely going for the other man's customer.

Mr. Sessions caused some amusement by saying that he thought every printer ought to go some night to his printing works, and with his pipe and note-pad take it room by room, turn on all the lights and sitting where he can see everything, spend an hour in each room, thinking hard as he smokes his pipe of the possible use of the plant he sees in front of him.

Dealing with the question of how much a printer should spend on advertising, Mr. Sessions put the figure at least 5 per cent. of his turnover, and he thought no printer should spend less than 2 per cent.

Mr. Sessions suggested it would be of great advantage to many printers if 24, Holborn, could set up an Advertising Department to advise members, and prepare first-rate copy for printers' direct advertising, as well as to prepare suitable illustrations from which electros could be sold or loaned.

We propose to publish Mr. Sessions' lecture in full next week.

Discussion.

In inviting a discussion, Mr. Jones said they had had without a doubt a most instructive and enlightening address. Mr. Sessions had referred to a certain poster as being the only printer's placard he (Mr. Sessions) had seen in London. Mr. Jones reminded them that their friend, Mr. Langley, had also a very creditable poster advertising his business.

Mr. Whyte mentioned that there was also on the hoardings a Hassall poster put out by a printer in the City.

Mr. Grubb said he was giving the question of advertising the closest consideration. He thought that a good deal of psychology entered the question of advertising and that it was governed by law and principle. It was up to them to understand the underlying fundamentals which contribute so largely to successful advertising.

Mr. Colebrook drew attention to the necessity that existed of not only extensive but also intensive development in connection with advertising. He appealed for a little more originality in their methods, and the employment of more powerfully telling strokes.

Tribute to Mr. Sessions.

Mr. Goodwin thought Mr. Sessions an ideal member of the Federation. He was also, he thought, one of the prophets of the printing trade and one of its practical idealists. He was always in advance of many of the movements taken up afterwards by the Federation. Mr. Sessions was one of the first to take up the Federation Costing System, and now he had come forward with the question of the variations of printers' estimates, a matter which had set people thinking about remedies. He did not want to speak fully on the question of collective advertising, as it was at present *sub judice*. They were waiting to hear from the rank and file of the Federation. He hoped that any collective advertising effort made by the Federation would not interfere with individual enterprise. He found people croaking about the bad winter that was coming and the tremendous volume of unemployment. That attitude created a depressing effect in the country, and was the best way to get a bad winter and increase unemployment.

Mr. Keliher said he was pleased to think that one effect the lecture they had listened to would have upon them would do something to circumvent the large amount of business that had been taken out of the hands of printers by the advertising agents; in that respect he wished that Mr. Sessions had lived a little earlier. Speaking of the advertising agent, Mr. Keliher said he got the ear of the customer long before they did. The printer had put a very low value on his services and consequently had been ousted from his position.

Mr. Langley thought the lecture they had listened to was filled with scientific commonsense and commonsense science the whole way through, and he hoped an opportunity might be found for putting it into permanent form.

Mr. Burt said Mr. Sessions always appealed to him as a speaker who believed in his own message. That was a good characteristic which he thought they should all aim at.

Mr. Sessions having briefly acknowledged the appreciative words of the various speakers, the Chairman added a final testimony to the excellence of Mr. Sessions' address and the meeting was then brought to a termination.

FURTHER details of Mr. Stanley Morison's important "Four Centuries of Fine Printing," which Messrs. Ernest Benn have in preparation, are now available. In this work the author demonstrates by means of a consecutive series of fine collotypes that the tradition of fine printing has, in spite of wholesale defection from high standards, never lacked its champions. Thus an admirable range is given of the works of Antonio Blado (Rome), Lorenzo Torrentino (Florence), Francesco Marcolini and the Gioliti (Venice). Some hundred examples of the early French Renaissance are reproduced, and the eighteenth century Rococo period, as well as the English 18th century, is also fully represented. The modern section exhibits a choice of the remarkably fine work achieved by the foremost American practitioners, notably Mr. Bruce Rogers and Mr. Updike. The entire publication will consist of some 500 reproductions in addition to a critical introduction, index, etc., the measure of the work being 13 inches by 18 inches. In addition to the ordinary edition, which will be strictly limited, ten copies will be published printed on a special paper, hand bound in leather, signed by the author, and with the initials of the text picked out in gold.

THE way to escape difficulties is not to run away from them.

Electrotypers and Stereotypers
MANAGERS & OVERSEERS' ASSOCIATION

Resumption of Monthly Gatherings.

The monthly meetings of this Association were resumed on Tuesday evening of last week at St. Bride Institute, Bride-lane, E.C.4. There was a very good muster of members and the chair was occupied by Mr. A. Chadwell (president). Owing to the fact that the Association had not met during the summer months, many of the members had not had the opportunity of seeing one another during the interval, and as a consequence the exchange of greetings that took place was more than usually pleasant. Especially warm was the welcome given to Mr. Chadwell, who has returned after a serious illness, and whom not only this Association but a wider circle throughout the electrotyping and stereotyping section of the trade hold in great admiration.

After the reading of the minutes by Mr. W. Bullett (secretary), the president read a letter from Mr. J. R. Riddell announcing the reopening of the London School of Printing and Kindred Trades and also drew attention to some literature relating to it, which he asked the members to take away with them and use to the best possible advantage.

In the absence of any lengthy or important Association business, most of the evening was occupied in considering and discussing questions affecting students and their training at the School.

Mr. J. S. Sunderland, electrotyping and stereotyping instructor at the School, who was asked if he could say anything about the prospects for the coming season, said last year the School was represented by about eighty apprentices and seniors connected with their section of the trade. This year the number would probably amount to a hundred or more, and in order to more efficiently cope with the work of training, Mr. W. J. Brewster had been appointed as an additional instructor to follow on in the evening the instruction that had been given during the day-time. While talking over the matter of general organisation, Mr. Sunderland said Mr. Riddell mentioned that the Stationers' Company last year gave no prizes for work to students in their particular branch of the trade, although a number of the boys did some very creditable work indeed, which would have entitled them to go to Stationers' Hall in the ordinary way. This year the Stationers' Company was giving two medals for theory and practical work combined. Mr. Sunderland, in passing, thought last year among eighty boys and men there might have been given some prizes so as to offer an inducement. Mr. Riddell had suggested to him that perhaps his (Mr. Sunderland's) Association might feel inclined to offer a prize.

Mr. Chadwell expressed much pleasure at the suggestion and thought it would be very nice if the Association gave a prize.

Mr. W. M. Forsyth wanted to know who would be the adjudicator, and how the results of the students' work would be judged, because he personally was more concerned about the actual advancement of the practical side of a boy's efforts rather than merely the question of good conduct.

An interesting discussion in which were expressed many varying opinions was then carried on by several members as to the relative merits of the boy who possessed cleverness at his work and whose behaviour at the same time was only moderate, and the boy who was dull at his work and yet was of good behaviour. The majority of the speakers seemed to favour the former type of boy because as a general rule they thought he in the end made the better craftsman.

Mr. Sunderland said if they decided to give a prize the Association could stipulate the conditions.

Mr. W. H. Longley, in heartily supporting the suggestion, approved of the Association doing all it could to encourage technical education. He accordingly proposed that the Association allocate a sum of two guineas to the electrotyping and stereotyping section of the London School of Printing and Kindred Trades to be used as a prize in a manner that might be thought best for the encouragement of all-round good conduct combined with efficient work.

Mr. W. Bishop, in seconding the proposition, thought that the students' work should be judged from a practical standpoint and by practical men.

Digitized by Google

The proposition was unanimously carried.

Mr. Chadwell, Mr. W. Bishop and Mr. G. Turner then expressed their willingness to give one guinea each to be used as additional prizes for electrotyping and stereotyping students at the School.

Mr. Sunderland said if one of the gentlemen generously offering these gifts would allocate his sum for the purpose of giving a prize to the senior section of students, he would be even more gratified.

Mr. Turner expressed willingness that his sum be allotted as Mr. Sunderland had suggested.

Mr. Forsyth, one of the stewards of the Association's annual dinner which is to take place at the Trocadero Restaurant on November 17th, stated that the arrangements for that event were well in hand.

The president said he hoped to see a large gathering of members and friends interested at the October meeting, when a lecture would be given by Mr. Hall, of the Monometer Manufacturing Co., on Metal Melting.

Reference was briefly made to the first concert of the season to be held under the auspices of the Electrotypers' and Stereotypers' Auxiliary, at a date to be arranged in November at Anderton's Hotel, at which Mr. Harry Williams was to occupy the chair.

A vote of thanks to the chairman brought the proceedings to a close.

Freemasonry.

Installation of Mr. W. J. Starkie as Worshipful Master of Saint Bride Lodge.

Paper and print were largely represented at the installation meeting and banquet of Saint Bride Lodge, No. 2817, at the Café Monico, London, on Monday, the 24th inst. Mr. William James Starkie, the new Worshipful Master, is well known in the paper and printing industries as the representative in

Photo: Alexr. Corbett, London, W.

MR. WM. J. STARKIE.

London and the South of England of Messrs. Porritts and Spencer, Ltd., of Bury, Lancs, makers of felts, blankets, etc., for papermakers and printers. Mr. Starkie is a very keen Freemason, and is a very popular member of the craft. With his keen, zealous and enthusiastic spirit, there is no doubt that he will worthily uphold the fine traditions of Saint Bride Lodge.

There were present Sir T. Vansittart Bowater, Bart., Past Senior Grand Warden, and many other Grand Lodge officers, including the Rev. Dr. Rosedale, P.G. Chaplain, Messrs. E. L. Waterlow, P.G.D., C. H. Thorpe, P.G.D., P. G. Mallory, P.G.D., etc., etc. There was also a delegation present consisting of Worshipful Master Dr. D. L. G. Radford, Past Deputy Master Alexander Macbeth, J.P., and Senior Warden Alfred Morris representing the Lodge of Edinburgh (Mary's Chapel). Among others present were T. D. Nuttall, W. Rowlandson, G. E. Oswick, Geo. Buchanan, H. Spencer, W. V. Marchant, Philip T. Goldney, R. Triggs, J. L. Greaves, Johnson, Wm. Carter, Fredk. Gillis, etc., etc.

The installation ceremony was impressively performed by the outgoing W.M. (Mr. G. F. Wilbraham), whilst Mr. Geo. W. Jones carried out the duties of director of ceremonies in a most capable manner.

The W.M. invested the following gentlemen as his officers: G. F. Wilbraham, I.P.M.; E. J. Day, S.W.; F. H Stollard, J.W.; G. R. Blades, treasurer; C. J. Drummond, secretary; G. W. Jones, D.C.; L. W. Oxley, almoner; E. S. Lendrum, S.D.; O. Lehmann, J.D.; A. Beech, I.G.; W. Wright, organist; A. E. Reed, steward; L. Tanburn, steward; and J. L. Smith, tyler.

The Worshipful Master received a most enthusiastic reception on taking the chair at the banquet in the evening. The attendance of members and visitors was quite a record one.

The usual loyal and Masonic toasts were honoured. Responding for the Grand Lodge officers, Sir T. Vansittart Bowater said he was pleased to see such an array of Grand Lodge officers present. He was particularly grateful that his name had been coupled with the toast, as he wished to refer to the installation that day of a good Lancastrian. Knowing their Worshipful Master as he did, and recognising the county from which he came—the finest county in the country—he predicted for him a most successful year of office. Their Worshipful Master was a good Lancastrian, a splendid sportsman and a well-known business man. The Lodge had honoured him, and the Lodge had also done itself justice. Referring to Grand Lodge Officers, they all did the best they could. The Grand Lodge of England had made an innovation in holding Grand Lodge in Liverpool, which had been a great success. He considered it one of the finest innovations Grand Lodge had done. Sir Vansittart spoke of the pleasure afforded Grand Lodge officers in visiting a lodge like Saint Bride, and seeing the work carried out so well, and also in giving the Master a good send off.

Mr. Geo. W. Jones submitted the toast of "The Lodge of Edinburgh (St. Mary's Chapel)" and extended a hearty welcome to the Worshipful Master, Past Deputy Master, and Senior Warden who were present that evening.

Dr. D. L. G. Radford responded in an excellent speech, in which he emphasised the splendid work of united effort. He also expressed his high appreciation of the compliment paid him in being admitted an honorary member of Saint Bride. In referring to the visit of the latter's delegates to the Lodge of Edinburgh in 1910, he hoped the close alliance would continue to strengthen.

"The Worshipful Master" was proposed by Mr. G. F. Wilbraham, I.P.M., who was convinced that he (Mr. Starkie) would fill the office with satisfaction, and he wished him a year of happiness and unbounded success.

Mr. Starkie responded in appropriate terms, and then submitted "The Installing Master and Past Masters." In response Mr. Wilbraham referred to the friendships formed and cemented during his year of office, and stated that the jewel presented by the brethren and the collar and jewel by his initiates would be treasured for all time.

Mr. P. G. Mallory, P.G.D., responded to the toast of "Masonic Charities," proposed by Mr. Albert Bennett.

Mr. G. H. Roberts, M.P., in an excellent speech, submitted "Our Visiting Brethren," and among the names coupled with the toast were Mr. W. V. Marchant ("Papyrus" Lodge) and Mr. R. J. Triggs (Royal Thames Lodge).

During the evening an excellent programme of music was rendered, the artistes being Miss Bertha Richens, Miss Kitty Lackington, and Messrs. Roland Taylor and Norman Long, with Mr. W. Wright as accompanist.

The programme was a most attractive and artistic production. Printed by "Geo. W. Jones, at the Sign of the Dolphin," on Whatman paper, it will be treasured as a memento of a most pleasant and successful gathering, particularly as it contains an excellent photo (which we reproduce) of the Worshipful Master.

NEW postage stamps of ridiculously high denominations have just been issued in Germany, the values being 100,000, 125,000, and 250,000 marks, surcharged respectively on the old stamps of 400, 1,000 and 500 marks In the Free State of Danzig, where German paper money is still legal tender, a new stamp of one million marks is being issued overprinted on the old stamps of 10,000 marks.

WASTE PAPER: ITS RECOVERY AND RE-MANUFACTURE. By Jas. Strachan. A Fund of Information; price 12s. 6d.—Stonhill and Gillis, Publishers, 58, Shoe-lane, London, E.C.4.

THE five players who had tied for the last two places in the qualifying play for the *News of the World* Tournament last Thursday, played off the tie, over 18 holes, at Woodcote Park, Coulsdon, on Friday. The successful players were F. Leach (Northwood) and G. M. Turner (Guildford), each of whom returned the excellent score of 72.

SANDLE BROTHERS.—After over thirty years' trading, this well-known firm of wholesale, export and manufacturing stationers, of Paternoster-row, London, E.C., has been converted into a private company and will in future be known as Sandle Brothers, Limited. The managing directors are Mr. Sidney J. Sandle and Mr. Henry J. Sandle, the founders of the business; and Mr. J. R. Ward, Mr. G. C. Bradban and Mr. J. Tidball, who have been associated with them in the conduct of the business from its earliest days, have become directors. Mr. S. E. Sandle, son of the senior member of the firm, who is in charge of the Wandsworth factory, has also joined the directorate. The new company has a nominal capital of £100,000 in £1 shares.

THURSDAY, SEPTEMBER 27, 1923.

Printers and Advertising.

THE increased attention being given up and down the country to the question of advertising by employing printers is a matter of great moment to the future welfare of the industry. Mr. W. H. Sessions, who dealt with the subject at the opening meeting of the west and North-West Association of Master Printers on Monday night, made it clear by the use of irrefutable arguments that judicious advertising should be done by every printer who wishes to increase his business. That printers are at length beginning to realise the importance of the subject was evidenced by the large attendance at the meeting of representatives of other district associations and by the tone of the discussion. Mr. Sessions did not speak without adequate experience on the question, for, as he told his hearers, the large sum he annually earmarks for advertising purposes in his own business more than justifies the outlay. The printing trade generally is beginning to wake up to the fact that what can be considered as its own birthright is being slowly taken from it by the advertising agent. Until a few years ago the prospective customer who wanted printing executed went to the printer as naturally as the man who wanted a piano went to the pianoforte manufacturer. If one looks for the cause which has brought about the change in this respect it will be found in many instances in the fact that the enterprising advertising agency has been out seeking printing orders while the printer has been content to wait in his office for orders to come to him just as they did before the days of the agencies. Of course, the work in most instances eventually comes to the printer through the medium of the advertising agent, but there is no reason why he should not receive it direct from the customer just as he did in days gone by. One remedy that seems to present itself, as Mr. C. A. Bates pointed out recently in dealing with the subject, is for printers to consider more seriously the question of providing advertising service in connection with their own businesses, and so grafting the two activities under one roof or control. In view of the desirable results that would follow the proper exploitation of the advertising field it behoves every printer throughout the country to give the matter his closest and most earnest consideration.

* * *

New York and its Newspapers.

THE printers' strike in New York—which brought first a stoppage of newspapers, then the issue of inadequate emergency news-sheets—has evidently made the New Yorker realise with a shock to what a great extent he is dependent upon his daily newspaper. It must also bring home once more to all concerned the serious damage that is done both to the printing trade and to the community by precipitate recourse to the strike weapon. From the rather meagre information available it would appear that the New York trouble, like our own crisis at Manchester last year, arises from the intransigient action of a local trade union, or branch of a union, in defiance of a larger union organisation. It appears that in New York the dispute is being overcome by drastic action, the larger union organisation taking the step of dissolving the insubordinate branch union and making terms with the employers over the heads of the local union leaders. The position is unfortunate, but should provide food for thought for those concerned with the organisation of the printing industry.

* * *

Markets for British Printing Paper.

REGARDING the markets to which printings were sent during August, we find that British Possessions absorbed 99,239 cwts. (66·3 per cent.), while foreign countries received 50,232 cwts. (33.6 per cent.). Though Australia continued to be the biggest buyer the August returns (45,582 cwts.) indicate a considerable falling-off, the volume of trade in that direction during May to July representing 305,661 cwts While New Zealand, British South Africa and Canada took more British printings last month than was the case twelve months ago, the figures for British India, Ceylon and the Straits Settlements indicate a dwindling tendency. A satisfactory feature of the returns, however, is the increase that took place in the shipments to "other foreign countries," namely, from 27,166 cwts. to 43,269 cwts. The value of British printings consigned to Colonial and foreign markets last month reached £245,556 as against £219,756 in August last year, an improvement in value of 11·7 per cent.

A Newport Printer's Wedding.

There was a large attendance at St. John's Church, Maindee, Newport (Mon.), on September 18th for the wedding of Mr. Arthur Liddington Johns, elder son of Mrs. R. S. Johns (of the well-known South Wales printing house ef R H. Johns, Ltd.), and Mrs. Johns of Newport, and Miss Phyllis May Linton, younger daughter of Mr. W. A. Linton, J.P. (deputy mayor of Newport) and Mrs. Linton.

The bride, who was given away by her father, wore ivory georgette and morocain, and carried a bouquet of pink carnations and white heather. She was attended by Miss Muriel Davies and Miss Violet Millar, who wore mauve shot taffeta and silver grey velvet hats. Little Joan Davies, niece of the bride, who wore shell pink georgette, acted as page.

The best man was Mr. R. H. Johns, brother of the bridegroom, and, in addition, there were three groomsmen, viz., Messrs. A. Jackson Thomas, W. Nance-Kievill and Wilfred Baker.

The officiating clergyman was the Rev. D. E. Ll. Jones vicar and rural dean, Mr. I. F. Liddington Johns was at the organ. After the reception at Ellerslie, the bride and bridegroom left by motor car for the south coast.

Mr. Arthur Liddington Johns has for some time acted as assistant secretary to the Newport Master Printers' Association of which his father, Mr. R. S. Johns, is secretary.

Printers' Prices are Not Controlled!

By A. E. GOODWIN.
(Secretary of the Federation of Master Printers.)

A curious controversy around the subject of the Federation Costing System has arisen at Newcastle-on-Tyne, subsequent to the recent meeting of the Corporation at which the decision was reached not to proceed with the proposed municipal printing plant. The Sheriff, who is connected with the shipping industry but is also a Labour M.P., remarked that, "To say that there is not a 'ring' in the printing trade is all cant." He suggested that printers met from time to time to fix prices, and that the printers' costing system was simply a method for upholding exorbitant charges. Curiously enough, an alderman of the Newcastle Corporation, who is a printer, but has not associated himself with the local master printers' organisation, gave these charges a flat denial, and bore witness to the existence of very keen competition in the printing industry. It is no new thing to suggest that scientific costing is only a camouflage for exorbitant prices, but the allegation indicates ignorance of facts or confusion of ideas, and calls urgently for correction. It cannot be too definitely stated that the adoption of proper cost-finding methods is entirely different from any system of price-fixing.

It is admitted, of course, that if proper cost finding methods are universally adopted in the printing industry the resulting knowledge will tend to reduce the amount of printed work sold below cost. Experience shows, however, that despite the Federation Costing System and all efforts to introduce it, we still have with us in very acute form the problem which faced the pioneers of the costing movement, namely, the fact that a considerable volume of print is sold at prices well below the actual cost of production—if by "cost of production" we mean the full and complete cost.

The adoption of scientific cost-finding methods necessarily tends towards more uniformity in printing prices. The exponents of the Federation Costing System endeavour to make plain that variations in prices are caused if different cost systems are used for the allocation of the various expenses incurred in running a printing business. If one printer recovers certain expenses by a general percentage added to wages and material, whilst another recovers them entirely from the labour side, there must arise wide discrepancies in prices charged. Such diversity would, of course, be reduced by the general adoption of more uniform costing methods. The fact remains, nevertheless, that even if a single system of costing were universally applied, there would still be plenty of room for discrepancies in prices on account of the difference in the efficiency of different printeries, their different capabilities in respect of equipment, and, moreover, different ideas as to proper profits. Scientific costing, therefore, though tending towards greater uniformity in prices, is quite distinct from arbitrary price fixing.

There is, however, a peculiarity about the printing industry whereby it is almost impossible, even were it desirable, to apply any general scheme for the fixing of prices. Printing is a made-to-order product—it is largely a service, not a commodity; and it is well-nigh impossible to standardise prices for services. Again, in order that prices may be standardised there must be a body which is endowed with authority for fixing prices, and which possesses also some means of inflicting penalties on those by whom its authority is disregarded. It is surely well recognised that no organisation in the printing industry has, or professes to have, authority of this kind.

The progress of the costing movement is very encouraging to those who have spent time and labour in promoting it, and its undoubted educational value is doing much to raise the printing industry from the low state in which it found itself some years ago. This educative activity makes no attempt to force a standard cost-finding system upon any printer who does not want it, still less to impose fixed prices for printing. Although there may be some who think otherwise, it is doubtless best that this should be so, and that those who labour for the uplifting of the printers' craft should look to education coupled with freedom, rather than to any kind of coercion, for the accomplishment of their purposes.

Technical Education for Printers.

Annual Meeting of Stationers' Company and Printing Industry Technical Board.

This year again there was a very crowded attendance, with prominent representation of many different sections of the printing and allied trades, on the occasion of the annual meeting and presentation of prizes of the Stationers' Company and Printing Industry Technical Board held on Friday at Stationers' Hall. The chair was occupied by Mr. Edward P. Vacher, F.R.G.S., Master of the Worshipful Company of Stationers, and the prizes and certificates were distributed by Mrs. Wilton Phipps, J.P. (chairman of the London County Council Education Committee), whilst amongst the many prominent people on the platform or at the front of the hall were: The Right Honourable C. W. Bowerman, M.P.; Mr. W. Howard Hazell, J.P., and Mrs. Hazell, Mr. R. A. Austen-Leigh, Mr. T. E. Naylor, J.P.; Mr. R. Bentley, Mr. R. T. Rivington, Mr. H. Hill, Mr. George Eaton Hart, Mr. A. E. Goodwin, Mr. W. Whyte, Mr. J. R. Riddell, Mr. Thomas Sproat, Mr. E. B. Judd, Mr. P. Squire and Mr. B. Cahusac.

The Master of the Company.

The Chairman, in opening the meeting, said the gathering was an indication of the desire of the Stationers' Company to link up the various crafts with which it was associated, in conjunction with the printing trades organisations, for the purpose of encouraging craft efficiency by setting up examinations on the result of which awards were given. As Master of the Stationers' Company he very heartily welcomed all those present; it was a matter of very great satisfaction to see such a splendid gathering. As an indication of the success of the examinations he mentioned that no less than 544 students had presented themselves for examination, of which number 180 gained first-class passes and 279 second-class. Mr. Vacher apologised for having to vacate the chair in order to keep an engagement out of London, and at his request Mr. W. Howard Hazell assumed the chairmanship.

Mr. W. Howard Hazell.

After conveying apologies for absence from Lord Riddell, Sir George Truscott and others, Mr. Hazell remarked that this was the completion of the first year of the London School of Printing, a very strong and successful daughter of the old school of St. Bride. It had been a very good year. A very satisfactory feature of the work was that employers recognised the great advantage of these classes and that half the students were attending the classes in their employers' time, without any deduction of wages, about half of them having their fees paid for them by the employers. There were 80 classes in all, with some 1,990 members. New classes had been started in connection with the bookbinding, foundry and other departments. Fifty-five students had sat for the City and Guilds Examinations, of which three had received silver medals and special prizes. All sections of the trade had given practical support, and a large number of manufacturers of printing machinery of all kinds had given or lent machinery to the total value of £15,000. Mr. Hazell concluded with an earnest appeal to students to make the most of the opportunities provided them.

Mr. T. E. Naylor.

Mr. T. E. Naylor was the next speaker, and in the course of his remarks said that the trade union section of the Advisory Council had no regrets—in viewing the work of the past year—that they had come to the support of the technical education movement. He remarked upon the different position they were in now, since they had become an advisory council to the London County Council. In this connection he welcomed Mrs. Wilton Phipps as representing the L.C.C. Last year something was said about the building that had been acquired for the purpose of the school, and they still thought—at least some of his colleagues shared with him the opinion—that the London School of Printing was deserving of a better building, for the one in which it was now housed impressed him as being unpleasantly like a police station or like a workhouse. (Laughter.) However, it was not the structure that made the school, but the men and women constituting the personnel. Speaking on behalf of the trade union section of the council, he could say that they would always back up their every effort, and, speaking still more particularly on behalf of his own society, he could assure them that the L.S.C. would always be at the back of the L.S.P.

Many Prizes and Certificates.

Mrs. Phipps then presented the very numerous prizes and certificates, prefacing this service with a short speech, in which she expressed her keen appreciation of the value of education and affirmed that the London County Council would always take every means in their power to provide facilities for the education desired.

The presentation of prizes being concluded, Mr. Bowerman proposed a hearty vote of thanks to Mrs. Phipps, also to the Master of the Stationers' Company for granting the use of the magnificent Stationers' Hall. This was seconded by Mr. W. J. Pincombe, of the L.C.C., after which brief responses were made by Mrs Phipps and by Mr. Hill (Past Master of the Stationers' Company).

Personal.

VISCOUNT AND VISCOUNTESS BURNHAM, Mr. R. A. Austen-Leigh, and Mr. and Mrs. A. E. Goodwin were amongst those attending the brilliant reception given last week by the Anglo-Swedish Society in London in honour of the Crown Prince of Sweden and Lady Louise Mountbatten, whose wedding is shortly to be celebrated.

LADY HULTON is very ill and obliged to go into a nursing home.

LORD HEADLEY, the Moslem Peer, who has just returned to this country after a visit to Mecca, was formerly a journalist, and for a period was editor of the *Salisbury Journal*.

SIR ROWLAND BLADES, M.P., who played for his own team against Ashtead on Saturday, took four wickets for 21 runs in the first innings, and six for 47 in the second. This brought his total of wickets for the season to 100.

SIR PHILIP GIBBS has given the world a fascinating glimpse of life at the heart of London newspaperdom in his "Adventures in Journalism" just published by Messrs. Heinemann.

MR. F. A. J. BURNS, of Messrs. Burns, Bailey and Co., Braille printers and oriental languages specialists, of Manor Park, addressed the Association of Master Printers of East and North-East London at Stratford on Tuesday on "Type Composition of Oriental Languages." His address dealt in interesting fashion with an unusual subject, and we hope to report it fully in next week's issue.

MR. A. H. POLE, of Bristol, has, we hear, been very successful in his recent efforts to reorganise master printers in Cornwall.

MR. L. J. CUMNER, of the Federation of Master Printers, journeyed to North Wales on Tuesday to discuss with the local Alliance officials steps for the strengthening of the master printers' organisation in the area.

MR. N. G. MILLER, the illustrations manager of the *Oxford Illustrated Journal*, has been presented by the staff of that periodical with a salad bowl and servers on the occasion of his marriage.

MR. STUART A. HIRST, the well-known Leeds advertising expert, will, on October 8th, deliver the introductory lecture on the "Advertising Course of the Leeds Central School of Commerce."

MR. C. W. BASHFORTH completed on September 11th twenty five years' association with Messrs. Frederick E. Potter, Ltd., advertising agents, having joined the staff of the firm on September 12th, 1898, thus having been with the firm almost from its commencement. To mark the event he has been presented with a set of golf clubs at a staff meeting.

ROBERT NIXON, LTD.—Capital £2,000, in £1 shares; to acquire the business of a paper merchant and dealer in ropes, twines and hessians carried on by R. Nixon at 8A, Lever-street, Manchester, and to carry on and develop all agencies at present carried on by the said R. Nixon. Private company. Subscribers: R. Nixon and W. Renshaw.

WARHAM GUILD, LTD.—Capital £5,000, in £1 shares; manufacturers and providers of ornaments of the Church and of the members thereof according to the use of the Church of England, manufacturers of and dealers in textile fabrics, stationery and leather goods, etc. Private company. Subscribers: E. A. Judges and W. Freeman. Subscribers appoint directors.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

COLLINS AND KEW, LTD. (stationers, printers, etc., London).—Debenture dated August 30th, 1923, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital (if any). Holder: J. Williams, 17, Sycamore-grove, New Malden, Surrey.

J. M. OUSELEY AND SON, LTD. (publishers, etc., London).—Debenture dated September 4th, 1923, to secure £500, charged on the company's property, present and future, including uncalled capital subject to prior debentures for £350. Holder: G. W. F. Smith, 64, Shooter's-hill-road, Blackheath.

CAXTON PUBLISHING CO., LTD. (London).—Satisfaction to the extent of £800, on August 2nd, 1923, of debentures dated May 3rd, 1910, securing £40,000.

SUNDERLAND POST CO., LTD.—Statement under Section 12 (old charges outstanding on July 1st, 1908, now first registered). Mortgages dated 1888 and 1902, securing £6,000.

CHARLES MARSDEN AND SONS, LTD. (paper manufacturers, etc., Sheffield).—Satisfaction to the extent of £4,400 on July 2nd, 1923, of debentures dated May 4th, 1922, securing £250,000, with a premium of 2½ per cent.

George Mann and Co. Outing.

The London office staff of Messrs. George Mann and Co., Ltd., together with their friends, went for a trip up the Thames Valley on Saturday, September 15th, when there were nearly 100 people in the party, and a very enjoyable day was spent, which the rain was not allowed to mar.

There were reserved carriages on the 9.20 a.m. train from Paddington to Staines, where the whole party embarked on one of Messrs. Salter Brothers' steamers at 10 o'clock. The boat stopped at Windsor to enable any who desired to see the town and castle. Windsor Castle was found to be of extreme interest, and a wonderful view of the Thames Valley was obtained from the keep.

After leaving this old town it unfortunately commenced to rain. However, everybody assisted to brighten the day, and with the help of a piano, two gramophones and the voices of various ladies and gentlemen, the whole party were kept in the best of spirits. The boat turned for home when it had proceeded some way past Cookham Lock. Arrangements had been made to go to Henley, but owing to the inclement weather it was decided that the steamer should not go so far. However, the fine scenery from Staines to Cookham was greatly enjoyed, even when viewed on a rainy day. On the return to Windsor the whole party entrained for Paddington Station, which was reached about 8 p.m.

The staff of George Mann and Co., Ltd., are full of praise for the organiser, and are certain that this was one of the most enjoyable days that they had ever spent.

From the London Gazette.

PARTNERSHIP DISSOLVED.

R. G. Lloyd and A. A. Lloyd, lithographers, printers and stationers, 10, Wyre-street, Fairfield-street, Manchester, under the style of R. G. Lloyd and Son.

BANKRUPTCY ACT, 1914.
RECEIVING ORDER.

E. Hunter, lately 193, Upper Thames-street, London, paper agent.

Payment by Results.

Mr. W. Howard Hazell writes to *The Times* to point out the advantages of the method of payment by results. A correspondent in that journal suggested that, instead of paying the worker by piece work or premium bonus according to his output, it would be better that the profits at the end of the year should be shared between capital and labour. By that method, says Mr. Hazell, the capital might receive 6 per cent. interest, and the balance of the profits be divided evenly as a further dividend to capital and as a percentage on the total wages paid. This scheme has many advantages, but it has grave drawbacks. In any organisation there are always some slack workers, and under this scheme they would receive the same share of the profits as the industrious employee, and the latter would be dissatisfied. If, instead, some system of individual payment by results be adopted, each is paid according to his merits. Another drawback is that workers come and go, and payments can only be made after the accounts are completed, many months later.

Necrology

Mr. H. Jackson, Otley.

Mr. H. Jackson, whose death has taken place at the age of 77 years, was a director for many years of Messrs. William Walker and Sons, Ltd., Otley, printers, and proprietors of the *Airedale and Wharfedale Observer*, and recently succeeded the late Mr. Albert Walker as chairman of the company. Mr. Jackson took a prominent part in public life, and for 21 years had been chairman of the Wharfedale Rural District Council. He was also for some time a member of the West Riding County Council, and was also an Income Tax Commissioner. At the funeral at Adel Church, Messrs. William Walker and Sons were represented by Mr. J. H. R Renwick (managing director), and Messrs. L. P. Burfield, J. A. Clarkson and T. J. Strong (directors).

The R.P.S. Exhibition.

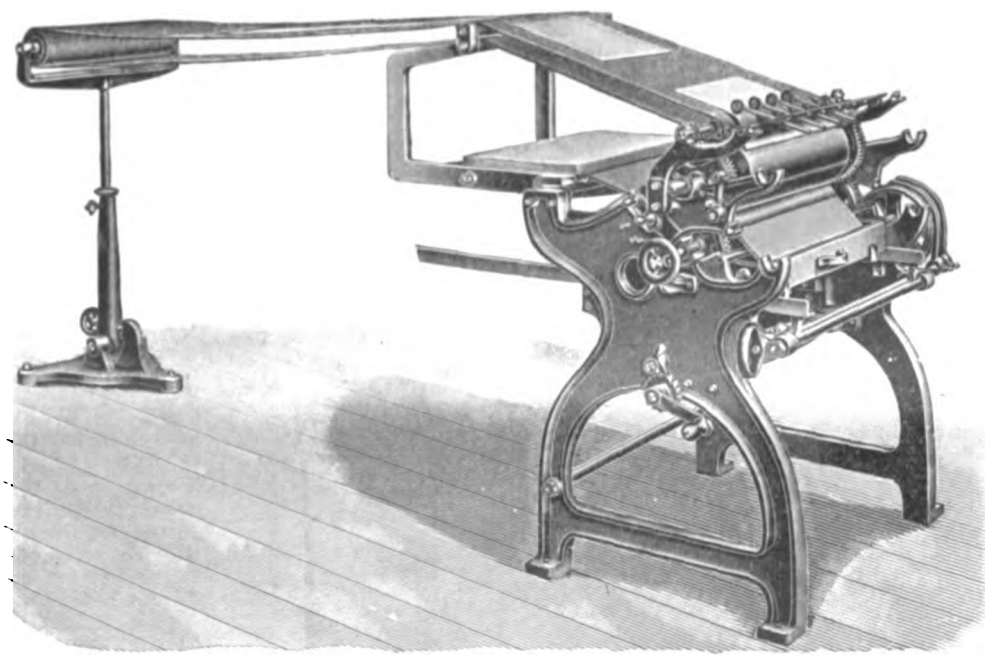
The Bawtree and Lee Photographic Type Composing Machine.

The 68th annual exhibition of the Royal Photographic Society of Great Britain is now open at the Society's house, 35, Russell-square, W.C., and will remain open until October 27th. A feature of the present show is that admission is free, and this should conduce to a greater number of visitors. The pictorial section contains a very fine selection of work, contributed by many of the leading pictorial workers of the day, and the examples are of a remarkably high quality both in selection of subject and in execution. In the technical section there are many interesting exhibits, including photomicrographs, radiographs, aerial and spectrum prints, natural history subjects and colour prints, of which latter there is an extensive show that includes pictures by the Paget, Autochrome, Raydex and other processes, including examples of three-colour work by the American Raylo Corporation, a firm that is working the method of Mr. H. C. J. Deeks, and the peculiarity of which process is that the examples shown are all enlargements from very small negatives.

The most interesting exhibit in the technical section, from a printer's point of view, is a show case containing examples of work done by the Bawtree and Lee Photographic Type Composing Machine, by means of which printers' type is superseded and its place taken by a photographic image that can be transferred to stone or plates and printed by either lithographic, offset or photogravure methods. The machine itself is not on view, but there is a photograph of it that gives a good idea of its size and general appearance, and a couple of the disks that are used in the production of the photographic image; these disks, about 10 ins. in diameter, contain the characters in negative form arranged round their circumference in such a manner in relation to the lens of the machine that they will align, however the scale of enlargement or reduction is altered. The sensitive material on which the impression is taken is contained in a roll holder that automatically moves along after each exposure for a distance varying with the width of the character, and by a simple adjustment it can be increased or diminished to any desired amount. The disks before-mentioned can be provided with openings up to 3¼ inches square, so that small negatives with ornamental initial letters, tail pieces, and even illustrations, may be inserted in their proper place in the text. In a similar manner the machine can produce an immense variety of border work of an ornamental character. In a description by the inventors the following particulars are given:—"A cabinet three feet square, with the machine upon it, will hold 1,200 disks, each capable of yielding characters of any desired size. Thus this one unit far exceeds in range the most extensive composing-room. The stock in this cabinet comprises not only alphabets and ornaments for borders, etc., but supersedes brass rule, and indeed everything else in the ordinary composing-room. One cabinet of disks will serve a number of machines, and the units need not be increased in number till the volume of work demands it. A disk and spacing cam cost together about as many shillings as a single fount of type costs pounds. Apart from accidental breakage, a disk will practically last for ever, as it is subject to no wear while in use on the machine. Ordinary type wears out all the time it is in use." As to speed in composing, it is given as from ten to twelve letters per minute, slower than composing type, but the time saved in the following printing operations is claimed to be overwhelming. Several specimens of the lettering as done by the machine are shown, and also a circular set up by the machine and printed by letterpress methods, a block having been made from the transfer by Messrs. Knighton and Cuts, Ltd. The product of the machine is a positive that can be used for photogravure, screening being done automatically at the same time as composing, or the image may be converted into a litho transfer and be used either for litho printing or etched into a typographic block. Should the machine and its methods be commercially practicable, it will certainly revolutionise the work of the composing-room.

CANADA:
Marking of Imported Printed Matter.

Regarding the exemption from the requirement of marking with an indication of the country of origin of certain printed seals, tickets and labels, a notice issued by the Canadian Commissioner of Customs and Excise on July 27th states that such exemption will only apply to seals, tickets or labels which are imported in packages containing quantities of not more than one hundred each.



AUSTRALIAN DUMPING DUTIES.—The High Commissioner for Australia is officially advised that playing cards from the United States have been brought under the operation of both Sections 4 and 5 of the Customs Tariff (Industries Preservation) Act.

ACCORDING to *Russian Information and Review*, the average wages of paper workers in Petrograd in May worked out at an average of 15.99 in pre-war roubles. The real wages of printing, tobacco and paper workers in May, as compared with 1913, were 61 per cent.

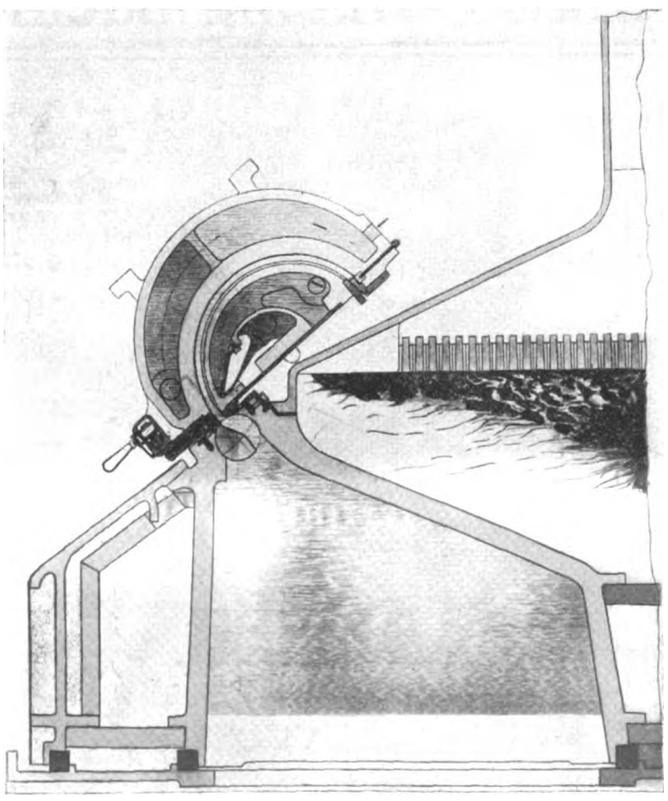
Printing Crafts Guild.

Opening of the New Session.

The new session opened on Saturday last at the Municipal College of Technology, Manchester, when over three hundred members and friends passed through the various departments connected with printing and photography where the instructors willingly demonstrated for the enlightenment of interested parties. Afterwards an adjournment was made to the large hall when Mr. John Taylor (president) had the support of Mr. Charles W. Gamble, O.B.E., M.Sc.Tech., Mr. Bethell (president, Master Printers' Association), Mr. H. Holme (hon. secretary) and Mr. A. Edwards (assistant hon. secretary).



Mr. J. M. Kellord's concert party included Miss Ethel Sharp (soprano), Messrs. Norman Brymer (baritone), J. M. Kellord (violin), Hugh Maguire ('cello), Hubert Brentwood (entertainer) and E. Sharp (accompanist), and the concert for the evening was so highly appreciated that encores were numerous.

During the interval, Mr. Bethell said that although the members of the Master Printers' Association did not appear prominent in the eyes of members of the Guild, yet they appreciated the good work accomplished. They always had great hopes of the results because all the officers gave their time and energy for the uplifting of the crafts. The Guild was particularly well placed, being so closely connected with the College of Technology, and he did not think any other Guild of its kind was so fortunate. In that great building there were brains and power and some of the brightest things of Manchester had come from within its walls. He advised the young members to put forth their best efforts as they had the opportunity of gaining knowledge from those who had passed through the College and were willing to give of their learning to those who followed. He noticed in the company some who had spent many years in helping the young craftsman to become more than the ordinary or second-rate individual, and Manchester wanted the best because what could be produced anywhere could be done in the city of Manchester. There never was a time when there were so many good openings as at present in the allied crafts, and particularly so in the costing departments. There was a bright future for those who attended the classes held in the College and who intended to get on. Some people were saying that the printing trade was dead, but that was a fallacy, as was proved by a recent remark by the coming Lord Mayor who stated that printing went with everything, and nothing could go on without it. He sincerely desired the young craftsmen to get firmly fixed in their heads the word "success" to open their minds, receive everything of learning, and when they had got it, to let other people know it. Then later on in life they would say, as many others had said, when they came within sight of that College, "that is the institution which gave me the knowledge to qualify for a good position, and from it I obtained all my high ideals."

Mr. John Taylor said much of his success was due to his connection with the College, and he thought he could never do too much to help the younger generation to come forward. The committee of the Guild and the teachers in the College were always endeavouring to make good citizens of the young people. Parents should encourage their children to attend the classes. After going through the courses many students found themselves later cut off from everything that would assist them to make further progress, but Manchester students were fortunate in having a Guild of that kind which helped them during their studies and supplied a necessary want afterwards. As president of the Guild he hoped the coming session would be a record one, and as the syllabus was likely to outstrip its predecessors there was every encouragement for all to go forward.

WEE MAC.

AMERICA'S LABOUR NEWSPAPER.—The New York *Call* has been taken over by the newly organised Labour Press Association, Inc. The new company is controlled by leading Labour unions through holdings of shares. An announcement in the paper says it will be developed as a genuine Labour newspaper, and that the total membership of the unions which have already subscribed for stock is about 300,000. It is confidently expected that a considerable number of other unions will acquire stock before January 1st. The Workingmen's Co-operative Publishing Association, the former owner of the paper, continues in existence and holds 15 per cent. of the common stock of the new concern.

Sectional View of Winkler Casting Machine.

This machine, described on a previous page, is by Messrs. Winkler, Fallert et Cie, S. A. Berne, for whom the sole agents in this country are Messrs. W. J. Light & Co., Ltd.

Postal Publicity Campaigns.

The Post Office Regulations.

Not every printer, perhaps, holds as clearly in mind as he ought the conditions which govern the transmission of printed matter through the post—a very important section of the market for the printer's products. Some useful reminders of various facts of interest in this connection reach us from Mr. W. H. Burchell, governing director of the Caxton Press, Leather-lane, Holborn.

Unsealed Envelopes.

There are, he points out, three varieties of unsealed envelopes, the contents of which may be sent at the printed matter rate, *i.e.*, two ounces for one halfpenny. The Post Office regulations for these on and after January 1st, 1924, prescribe that unsealed envelopes, with flaps tucked in must not exceed 6 ins. in width and 3½ ins. in depth. This "commercial" size envelope is permitted to be used for sending circulars, invoices, statements, receipts, orders and Christmas, New Year or birthday greeting cards. If larger envelopes are required for catalogues, booklets and other printed matter, then the flap must be the narrow way on the envelope and is limited to a width of 4½ ins., but can be tucked in. If a still larger opening is required then the flap should be specially cut to fit into a slot, to prevent the trapping of other correspondence; or a suitable metal paper fastener is permitted to answer the purpose with any size flap either way of the envelope.

Printed Wrappers.

As an alternative to envelopes, printed wrappers can still be used. They can be of a size to cover the enclosure completely. The ends of the wrapper must be left open, and if necessary be tied both ways with twine to obtain extra security. The use of the printed wrapper is cheaper.

What Can be Posted for a Halfpenny.

Two ounces in weight are allowed, as from Monday, May 14th, 1923. The varied extent of publicity literature which the halfpenny rate will carry is not generally known. It will cover any of the following catalogues:—

Pages.		Size of Catalogue.
16	...	11 x 8½ in., Order Form and Envelope.
16	...	14 x 9½ in.
24	...	8½ x 5½ in., Order Form and tinted Art Paper.
24	...	7⅞ x 4⅛ in., White Art Paper.
32	...	10¾ x 8¼ in.
32	..	9½ x 7 in.
48	..	8 x 5⅝ in.
64	..	8½ x 4½ in.
68	...	4¾ x 6¾ in., Order Form and Envelope.
72	..	7¼ x 4½ in.
80	...	8 x 4¼ in.

Such catalogues can be enclosed in envelopes or wrappers, and can be printed on a highly-finished super-calendered paper fit to receive the best produced half-tone illustrations.

The halfpenny rate enables industrial firms to send out prospectuses, balance sheets, circulars, price lists, invoices, statements, order forms, market reports, acknowledgment forms, also imitation typewriter circulars (if handed in at post office in lots of not less than 20 copies and signed for on a form provided). It also allows of a mailing card, *i.e.*, a printed matter card, minimum size 4 by 2¾ in., 3½ by 5½ in. (or double this size if used for a reply card), up to a maximum size of 12 by 24 in. (this large card can be folded in half). A birthday or picture post card, etc., containing *five* words of greeting, the date, name and address of sender, also addresse, may be sent for one halfpenny.

BRITISH MALAYA imported last year from the United States stationery and paper to the value of £29,131, which compares with a figure of £43,246 in the preceeding year. For January–April this year the value was £18,026.

A FOUR million dollar paper mill is projected for Chicago. News-print from old papers will be manufactured in the main building, while two extensions will be built and equipped for the making of board and felts.

German Paper and Print.

Gold Accounting Affects Paper Trade—Shortage of Capital Seriously Felt—Strike Decisions—High Wages Cause Printing Plants to Close—Prices for Books—Lower Paper Consumption—Export a Necessity—Larger June Figures—Papermakers Enforce New Terms of Payment—Opposition by Wholesale Dealers.

(By Our Own Correspondent.)

THE introduction of gold accounting in the paper trade has changed conditions in the home market considerably. The principal result is lack of capital in many plants, both those producing paper and those manufacturing it into other articles. This is the effect of the sums necessary for paying the gold amounts and the constantly increasing wages.

WORKMEN claiming gold wages have decided to strike at many places. In Silesia and Saxony pulp and paper workers have left the mills. In Berlin and Leipzig the disputes in the printing offices have come to an end in favour of the workmen.

THE high wages are a serious proposition for many book and newspaper publishers and printing offices. In Berlin master printers had to pay in the week from August 18th to 24th 30,000,000 paper marks, representing about 30s., while in the last week of August the rate went up to 72,000,000 or about 72s. Workmen thus get a wage double that of pre-war, which is a severe handicap upon the employers.

BY reason of the increased printing rates and the variation in the paper mark, domestic prices of books have been much higher than the official export prices. The era for low book prices is said to have ended in Germany, since the smallest book now costs some millions. Another factor which is having the effect of reducing paper consumption is represented by the difficulties which face printing and paper converting houses. As wholesale stationers are unable to place orders, the order books of paper mills are very empty so far as home delivery is concerned.

OFFICIAL export quotations have not been altered by the home gold accounting and are therefore lower than the world market quotations by the same percentage as previously ruled. The consequence has been a jump in export figures concerning raw paper and manufactures. The whole effect of the situation is that paper mills and manufacturing stationers are more than ever dependent upon export trade.

STATISTICS for the month of June indicate the growth of export. During that month pulp was sent abroad to the extent of 10,837 metric tons, which compares with the monthly average of 6,189 metric tons for last year. Paper and manufactures thereof exported in June reached 47,602 metric tons, as against an average of 34,788, while the respective figures for books and music notes were 646 and 1,073 metric tons.

OWING to the variation in the paper mark, the Joint Papermakers' Association have introduced since August 15th more severe terms of payment. Accounts are to be paid within seven days and by the amount of paper marks according to the dollar level of the day previous to accounting. The object of this arrangement is to preserve paper mills from heavy losses by reason of the fall in the exchange.

THESE terms, however, are not accepted by the wholesale dealers, who have decided to reject them. It is not likely, however, that they will be able to alter the decision of the Papermakers' Association.

ON the whole the situation in the German paper trade is described as darker than it has ever been before, and it is impossible to forecast the state of things for two days together.

"Standard" News Defined.

A definition is at last forthcoming as to what is "standard" news-print paper as covered by Paragraph 1,672 of the free list of the Fordney Tariff Act of 1922.

According to a statement issued by Mr. Mellon, Secretary of the Treasury, Washington, "standard news print paper" is defined "as consisting of mechanically ground wood pulp and chemical wood pulp or sulphite containing not in excess of 30 per cent. of sulphite, and varying in weight no more than 10 per cent. from 32 pounds to each 500 sheets of 24 inches by 36 inches. This definition is applicable to news print paper without regard to the colour thereof."

Papermakers do not appear to be satisfied with this decision; and the *Paper Mill* (N.Y.) describes the definition as "an empty phrase," since it means that there will be no relief for the American news-print manufacturer from "cheap foreign competition."

"The policy of the present administration (at Washington)," adds the *Paper Mill*, "is supposed to include encouragement of the development of a foreign trade by American paper manufacturers—but so far as the news-print industry is concerned it is always placed in the position of fighting for its life in its own country, where it is continually confronted by keen competition from abroad. That this cheap competition from foreign news print manufacturers is destined to continue, and, in fact, is encouraged, is made completely certain by this permanent definition of the term 'Standard News-Print' that has just been handed down by Secretary Mellon."

PENNY postage throughout the Empire for a fixed letter-weight is amongst the proposals which the executive of the Association of British Chambers of Commere have submitted to the President of the Board of Trade, in view of the discussions on the subject of inter-Imperial trade at the coming Imperial Economic Conference.

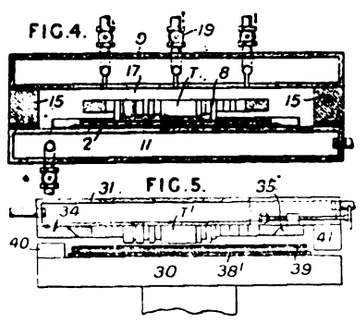
New Inventions

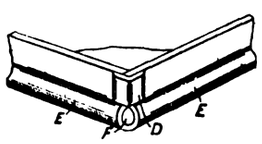
Printing Surfaces, etc.



Flexible printing plates, blankets, or the like, are secured in small gaps in the cylinder by means of radially movable tensioning members fitted with means for engaging laterally projecting fittings secured to the ends of printing plates, etc., preferably in registered relation to the designs on such printing plates. As shown in Fig. 1, a plate *b* is drilled at each end with holes to which are secured bolts *d* by means of nuts *e*, or the bolts may be rivetted to stiffening pieces *f* as shown at the right side of Fig. 1. The bolt heads are received in undercut recesses *h* formed in a bar *g* which is mounted on tensioning screws *c* which are adjustable radially of the cylinder *a*, springs *k* being arranged to support the bar *g* on the screws *c*. The bar *g*

may extend right across the cylinder or it may be divided into sections. In some cases it is formed of two parts, as shown in Fig. 3, the recesses *h* of which receive bolts on opposite ends of the plates, the two parts being independently adjustable. In a further modification, Fig. 6, a stiffening piece as *f* is rivetted to the plate *b* and the tensioning member *l* is rotatable on the screw *c* by a spanner, and is formed with a wedge-shaped under part l^1 which engages the bar *f* directly, and act as a cam to move the piece *f* to effect the tensioning. The member *l* is rotated a quarter of a turn to apply the tension. In a further form each end of the plate *b* is formed with a bar *f* and one member *l* engages both bars *f*, and simultaneously applies tension to both ends of a plate. The invention is patented by Mr. A. B. Evans.

Printing Plate Matrices.



This invention relates to the method of making matrices for the production of electrotype or moulded printing plates, in which the original, such as a type forme, is pressed into a mass of metal heated to a plastic or to a completely fluid state, and removed after the metal has cooled, and consists chiefly in the use of a separating medium

between the original and the metal to facilitate removal of the original and prevent oxidation of the heated metal. Fig. 4 shows one form of press for making the matrices, comprising hollow platens 9 11 which with side bars 15 form an air-tight chamber 17 when the press is closed. The matrix metal, preferably an alloy of 6 parts of lead, 6 parts of tin and 1 part of bismuth, is placed, in solid form or previously melted, in a pan 2 upon the bottom platen 11 which is heated by steam to melt the metal or keep it in melted condition. An oily substance such as paraffin is applied to the surface of the metal o prevent oxidation and facilitate the subsequent removal of the type forme T. This type forme is then placed upon the metal, the depth of penetration being limited by bars 8 which rest upon the bottom of the pan. The press is then closed, the steam cut off, and cold air under pressure admitted to the chamber 17 through a pulsating valve 19 to force the molten metal up into close contact with the type face and to solidify it. In another form of press Fig. 5, the forme T^1 is secured to a steam-heated stationary upper platen 31, between fixed and adjustable bars 34, 35, and the pan 39 of molten metal, coated with paraffin, is placed on a sheet of asbertos 38^1 resting on the lower movable platen 30. When the metal has cooled to a plastic condition, the steam is cut off from the upper platen, and the press closed to force the metal against the forme T^1, the penetration being limited by bars 40, 41. Cold air or water may then be admitted to the upper platen. The matrices so prepared may be provided with an electrolytic coating. Before being pressed into the metal, the formes may receive a thin electrolytic coating which is given a further coating of a weak solution of iodine or pyrogallic acid and a final coating of graphite "Make-ready" may be placed at the bottom of the metal pan if it is desired to produce printing plates made-ready for printing. The patentee is Mr. J. S. Stokes.

Printers' Galleys.

According to an invention that is patented by Mr. R. F. Moore, galleys are made from a single sheet of steel or other material, the sides and one end of which are pressed upwards to form a tray open at one end, the corners being re-inforced on the out-

side with additional material D, for example, by electric welding. The sides and end may be formed with a bulge or bead E so as to leave openings F which serve as drainage holes.

Metallic Pigment Inks.

Metallic pigment inks for use with heated dies, etc., in stamping book covers, labels, etc., and applicable for ordinary printing, as introduced by the Alchemic Gold Co., Incorporated, are made with a vehicle consisting of a non-corrosive binder, such as a neutralised resin or a resin ester, particularly ester gum obtained by esterification of white rosin with a glyceryl radical, dissolved in a neutral solvent, such as terpineol.

Paper Substitute for Corner Posts.

It is reported that several of the leading Rugby League clubs have decided to use a paper substitute for the wooden corner posts used on the football field.

The invention, which is the idea of Mr. Gilbert C. Inman, managing director of Inman's Limited, the well-known Leeds printers, consists of a wooden spigot, which is driven into the ground, a tube of compressed paper 3 ft 6 ins. long, and an inch and a half in diameter, which fits over the spigot, and a cork, carrying a light bamboo flag stick, which fits into the upper end of the tube. The tube is varnished to resist wet; but immediately bends if a player runs into it It will withstand a fair amount of bending, but as the tubes cost only a shilling, the question of renewal is not a serious one.

THE latest addition to the list of sporting periodicals is *Rugby Football*, of which the first number has just been published. It is edited by W. Livingstone Irwin.

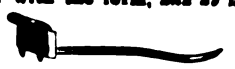
A New Colour Process.



Latest advices from Vienna mention a remarkable process of reproducing coloured pictures, invented by the well-known Vienna painter, Ulf. Seidl. The process is being taken up by the Wurthle printing firm of Vienna, and has been titled the "New Wurthle Facsimile Procedure." The reproductions are said to be so perfect that even experts can scarcely tell the copy from the original. Several examples of the process were shown at the Leipzic Fair, where they attracted much attention. So far Ulf. Seidl has reproduced ten pictures from the Public Galleries, of the Old Masters. Colour printers on the continent are taking a great interest in the development of the process, which, if it does all that is claimed for it, will revolutionise the present methods of colour printing.

Disinterested Advice.

In "Notes for Buyers," the house organ of Messrs Spicers, Limited, "Ubique" writes: "By the way do you take in the weekly journal of the craft, the 'BRITISH AND COLONIAL PRINTER AND STATIONER'? I haven't a farthing of money interest in it, but fair's fair; and when I see this country producing a weekly printing trade paper which the craft in other great countries cannot produce, and when I see such plenty of good craft matter in it, I feel constrained to put in a word about it. You are surely not doing yourself justice unless you take it and regularly glance over it."

European Paper Conditions.

Impressions of a British Paper Merchant on the Continent.

Mr. Harold H. Hardy and Mr. H. G. Bradly, C.B.E. (Messrs. Burnell, Hardy and Bradly), have just returned from a Continental tour, chiefly embracing Finland and Scandinavia. The trip was undertaken with a view to introducing Mr. Bradly to the principals of the various mills which the firm represent. During the three weeks Mr. Hardy and Mr. Bradly were abroad they covered over 4,000 miles. Only four or five nights were spent at hotels, the rest of the sleeping being done on board the train or on the boat.

The travellers, of course, had a variety of experiences with the fluctuating mark. When they entered Germany, for instance, the exchange stood at something like 20,000,000 marks to the £, and when they returned it had fallen to 250,000,000. On the outward journey a cigar cost 750,000 marks, while on the return it had gone to 20,000,000. Dinner on the train, again, which cost countless millions, including 10 millions for a bottle of wine, and a 10-million tip, only worked out at 5s.

There is, however, a serious aspect to the exchange problem, even for Germany itself.

"The whole industrial condition of Germany is getting into a bad way," said Mr. Bradly in conversation with a representative of the *World's Paper Trade Review*. "With regard to the paper mills a number of them are on short time and the whole atmosphere is one of depression.

"As to the contention that people in Germany are flourishing under the existing conditions, of course, if you regard a man as being well off who spends his money as soon as he gets it, this contention may be right; but as a matter of fact the German workpeople spend their money immediately, for the reason that on the following day it might be only worth half. The German gambler or speculator may benefit by this condition of things, but the German people are suffering.

"With restricted demand at home for their products, German paper manufacturers are forced to send their wares abroad, and it is this competition which is disturbing so much the markets of the world. German competition in quantity, however, is not so great as one would at first imagine," said Mr. Bradly, "but with world conditions, with the possible exception of the United States, showing that the supply is in excess of demand, any offers which are made from Germany have more effect than they would otherwise have.

"The problem of the exchange, however, is an extremely intricate one, and it is seen that the stabilisation of rates does not necessarily benefit the country which brings this about. As soon as the Austrian exchange was stabilised prices became too dear, and in some cases we find now that the Austrian paper is even dearer than the Swedish.

"British papermakers are not alone to suffer from this frantic fall of the German exchange. Other countries are suffering just as badly as we are. The Scandinavians, we were told, for instance, are faced with the alternative of closing their mills down, rather than attempt to compete with German prices. This only shows how world-wide the effect of the German debacle is, and how inter-dependent we are upon one another."

Finnish Enterprise.

Mr. Bradly was particularly impressed by Finland, where the chief interest of his firm lies, for they represent the Finska Trasliperiforeningen (Finnish Union of Board Mills).

"I was very much surprised to see the wonderful state of efficiency which their mills have attained," said Mr. Bradly. "The quality of their paper has improved steadily, and their pulp has attained a good reputation. Finnish papermakers are, however, also suffering from German competition just like their Scandinavian neighbours and ourselves. As a consequence, a number of machines are at present shut down.

"Another matter which depressed the market over there during our visit was the occurence of the Japanese earthquake. This is just an illustration of how sensitive the paper market is at the present moment.

"Generally I think Finland is an ideal country for the development of the box board industry. She has wonderful forests and an amount of water power of which she can only use a fraction. The Finns are, in fact, practically independent of coal, and their water supply is so abundant that to generate steam they do so with electric boilers running through turbines. What a blessing it would be if the spare power could be harnessed and sent over to this country!

"Finland, of course, is a very sparsely populated country, having only some three million inhabitants. But their board, paper and pulp industry does them great credit. It is thoroughly well organised, being controlled by three unions. I think that 95 per cent. of the total output is controlled by these organisations, which are illustrative of the dictum that union is strength.

"In some respects the methods adopted by the Finns are somewhat drastic. As an illustration, it is interesting to recall that recently the Socialist Government, when some thirty Communists were elected, and began to show their hand, promptly clapped these gentlemen into gaol, and so put an end to their activities. It will thus be seen that the Finns do things whole-heartedly.

"But to return to the consideration of the board, pulp, and paper industry. Certainly very big strides are being made with the development of the natural resources of the country. Board, pulp and paper, together with the timber industry, represent the principal wealth, and the Finns are making the most of it. Finland is a peculiar country. It contains 30,000 islands and 30,000 lakes. It lies so far north, indeed, that they do not get sufficient sun to grow crops in some parts which would ripen, except in the extreme south. But so far as the paper industry is concerned, they have the main raw material, pulp timber, in abundance, together, of course, as I have said, with water power."

With regard to the machinery in the mills, the Finns apparently manufacture a great deal of this themselves. There is, however, in industry generally, a scarcity of male labour, so that the proportion of women and girls employed is large.

Although she possesses enormous wealth in timber, Finland is fully alive to the need of re-afforestation, and a scheme has been adopted to ensure supplies to the paper industry in the years to come. As a matter of fact, however, re-afforestation is a natural process, and the question of denudation gives no immediate concern.

Finnish Paper Industry.

Some Statistical Data.

Official statistics covering the industries of Finland were recently issued in that country and some extracts from the official publication for the year 1921 are given in the *Finnish Paper Journal*.

In the paper industry there were 15,700 workmen, while the value of the manufactured products was 1,270 million marks.

With regard to the origin of the raw materials used, it is shown that the value of the foreign raw materials used in the ground wood pulp mills amounied to 1·4 per cent., in the paper mills to 11·2 per cent. and in the cellulose mills to 27·8 per cent. of the total cost of the raw material.

As to the ownership of the various mills, the statistics show that out of 186 enterprises in the paper line in Finland, none belongs to the country, one to the State, two to joint stock concerns, 20 to private owners and 163 to limited companies.

The following statistics show the number of mills and the value of production in the paper group:—

	Number.	Production: Million marks.
Boiled pulp wood factories...	1	11.9
Mechanical wood pulp and board mills	49	202.9
Cellulose mills	23	429.1
Paper mills	30	556.8
Wall-paper factories ...	5	7.3
Envelope and paper bag factories	14	11.5
Bookbinding and carton factories	58	39.4
Paper refining mills... ...	6	12.1

THE Library Bureau, Ltd., dealers in card and filing systems, etc., vacated their premises at No. 4, Cheapside, on the 10th inst., and have removed temporarily to No. 2, Ludgate-hill, pending the acquisition of larger and more convenient premises, for which they are in negotiation.

13 IS THIRTEEN AN UNLUCKY NUMBER ? WE SAY **NO** 13

? CURIOSITY ?

is a human failing. It is also a commercial asset. Curiosity is, in fact, one of the secrets of modern commercial success. It keeps you in touch with every modern development of the trade in which you are engaged.

It is a commonplace to say that the printing trade covers a range of activities greater than most.

Obviously, therefore, you haven't the time personally to gather the information to keep thoroughly in touch. This is done for you by the *British and Colonial Printer and Stationer*.

You probably have many friends in the trade, however, who are not keeping in touch.

CO-OPERATION

You can help your friends and us by introducing to them the *British and Colonial Printer and Stationer*.

Let us have their names and addresses : we will do the rest

THE

British & Colonial Printer & Stationer

has been established for nearly 50 years. The more important features are :

Reports of Trade Associations, Societies, etc.,
Latest Commercial Intelligence
Technical Articles
Trade Notes
etc.. etc.

A monthly issue contains a section devoted to the **Bookbinder** with notes and news and market prices

The monthly **Lithographic** issue contains special litho matter including litho notes and news.

The **Quarterly Export** issue deals with colonial and foreign markets and provides a general review of the home trade.

COST

The yearly subscription to the *British and Colonial Printer and Stationer* is **Thirteen Shillings** including postage. Is it not worth it?

Send us your friends' names and addresses **To-Day**.

13 THIRTEEN SHILLINGS WELL SPENT 13

THE TRIUMPH OF Modern Offset Lithography

By JOSEPH GOODMAN, F.R.P.S.,

City and Guilds of London Honours Silver and Bronze Medallist, Lithography and Photo-Mechanical Processes. Author of "Practical Modern Metalithography," etc.

In our last chapter we very briefly intimated that both intaglio and the planographic methods of printing could be produced at one and the same time from the same plate and machine, without any special attachment being necessary for the offset press upon which this was being done. In fact, any type or make of offset machine was capable of combining a duality of methods, rendering at the same time two distinct forms of printing impression, one, the true, soft, sharp, pleasing offset image, and two, the dense, powerful and velvet-like texture of picture that is so much the cherished province of the copper and steel plate engraving vogue.

Combining Intaglio and Offset.

This combination of two different forms of printing systems was not limited to hand intaglio and hand planographically produced images either; as a half-tone, photo-mechanically produced image of flat surface capacity could be transferred upon a plate that had previously received the photo-engraved image upon it. Or if otherwise desired, any form of planographic image could be drawn or transferred to any plate that was previously prepared with a photo-engraved image. Likewise a hand manipulated engraved image could be produced upon a plate having a transferred hand-drawn image already made upon it. In fact either could be made to precede the other at will, but it was often the most convenient to produce the photo engraved intaglio image first. With regard to the column rulings intaglio work, this was more frequently done after the ordinary lithographic transfer image was done upon the machine printing plate, from which explanations it will be observed the methods afford a wide range of convenience.

Thus the offset method is capable of yielding at each impression a multiple printed image possessing the dual features of intaglio and planography, a possession and characteristic which neither of the other two methods of printing can imitate or render. The relief printing methods are confined to that capacity alone, and cannot yield at the same time and from the same procedure of printing, either a planographic or an intaglio image in conjunction with the relief one. On the other hand, the intaglio printing method is incapable of producing the relief or the planographic from the same printing surface at the same time, as is the case with the offset previously explained. Nor is the intaglio capable of printing upon the same range of surfaced papers, and tender textured papers as the offset.

Thus the offset method is not only more versatile and varied in its printing character, but it also carries that faculty into the range of printing papers, and printing surfaces either metallic, repellent or rigid.

So far our reference has been confined to single colour printing, or chromo printing by means of one colour at a time by the offset method of impression.

Two-colour Offset.

We have now to refer to another triumph of the offset principle of printing, that of two-colour offset, in which two separate and distinct colours of a multi-colour job are printed at the one passage through of the sheet of printing paper. This prolific form of offset printing is not confined to the commoner classes and grades of colour work, but is at once practical and efficient upon colour work as wide in range as from poster to show-card chromo lithography. From this we do not wish it to be inferred that every form of lithographic colour work can be printed by these two-colour offset machines satisfactorily, as there are such classes of lithographic products as ceramic work, decalcomania lithography, and bronze and metal leaf work which are not suitable for these multi-colour offset machines, nor, for that matter, for the single colour ones, or even direct rotaries. Therefore some degree of differentiation must be made, but as these classes are special forms of lithographic work, and only constitute a very small percentage of the mass of work done by lithography, the limitation is not a serious one, nor one which affects the main issue.

Gains in Economy.

With these multi-colour or two-colour offset machines, considerable economies are effected, as not only can two colours be printed at one passage of the sheet through the machine, but work involving printing on both sides of the paper, such as music sheets or ledger rulings, book work and periodicals, and several other types of work of a similar nature can be produced outright without delay.

In quite a formidable range of chromo work these multi-colour offset machines are an acquisition to the craft, as they not only economise time, but help to cheapen production a little, thus attracting a larger volume of colour work to the trade through these facilities.

Whilst we should prefer to reserve the best class of colour work for the single-colour offset machines, the multi-colour offset is capable of negotiating these classes better than they could be accomplished by the old time direct rotary machine. In that comparison, therefore, we can leave its application for the moment.

The latest development in connection with these multi-colour offset machines is their adaptation for reel-fed work in place of the sheet-fed work; thus advancing them still another stage equipped for competitive application with the relief methods of printing.

Big Future of this Development.

The two-colour offset has unconsciously if not surreptitiously set up a new standard of labour economy, by enabling one machine minder to negotiate these machines printing two colours at the one time. The same amount of printing if done upon the single-colour machines would involve one machine minder for each colour, whereas in the case under review one minder negotiates two colours at the single transit of the sheet through the machine. This feature is considered by some to be a partial solution of the labour problem, but the human element is still predominant, and must necessarily remain so, so far as present vision of outlook enables us to judge.

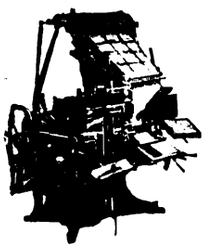
As the natural trend of the public desires are towards colour display in substitution for black illustration, and as this feature is diligently fostered in very early childhood of to-day by the children's coloured illustrated papers, it is safe to prognostigate that colour printing will in the very near future play a much more conspicuous and necessary part in human affairs, and in that wise we may look for a big development in the application of these multi-colour offset machines in catering for that range of colour printing, particularly

Digitized by Google

as it lends itself to the utilisation of photo-mechanical methods more readily and economically than either of the two other competing methods.

Apart from the coloured magazine and newspaper applications, there is the ever-expanding field of merchandise in which distinctively coloured wrappers and containers will replace the old time mono-colour articles, so soon as production costs warrant it.

An American Litho Plant.



A trip through the shop of the American Lithographic Co., at 19th street and Fourth avenue, New York City, convinced us that there is no more complete plant to be found in the East, if there is one anywhere in this country, says the *New York National Lithographer*.

Practically every job turned out by this big concern is done by photo-lithography, and the quality of it all is such that any judge of lithographic work would mark it "A1" without a doubt.

Besides a battery of single colour offset presses they operate a lot of two and three-colour machines that are kept busy every day and considerable night work is also done to keep up with orders that a sales force second to none in the country keeps coming in.

Most of the work turned out by the American is prepared by the plate-making machine process. They have three different makes of these modern machines in operation, with a full force of photographers and plate preparers and the amount of work that these machines can get ready for the press on short notice is something you will have to see to appreciate. Before the photo composing machines were invented it must have taken an army of transferers to keep the American's presses running, for when you take into consideration the amount of work that can be turned out by more than twenty offset presses —many of them two-colour machines—you will agree that the transfer department has considerable work to do.

It is conceded by those who ought to know that the work turned out by the American Lithographic Co. is not excelled in quality by the work of any similar concern in this or any other country. Some of their reproductions of famous paintings are certainly works of art which would be worthy of a place in any art gallery in the country. Besides the lithographic equipment the American operates a good sized type plant that is always busy.

HOW ARE YOU SETTING YOUR DISPLAY COMPOSITION ?

If you will permit us to do so, we can show you by actual demonstration that the Linotype can set, to your full satisfaction, the whole of your display work (whether it be general jobbing, title pages of books, etc., or headlines and displayed advertisements for your newspaper), up to and including 36-point, in the best and most economical way.

Litho Printing Surfaces.

Professor from Prague Demonstrates New Invention in U.S.A.

Professor Francis Mares, a noted lithographer of Prague, the birthplace of Alois Senefelder, is visiting America with a view to demonstrating two inventions which he claims are the products of his brain.

The price of the Solnhofer litho stone has so increased that it seriously imperilled the life of lithography in Bohemia, now Czecho-Slovakia. From these remarks, which have been taken from the *Nova Prace*, the official organ of Masaryk's Academy of Labour in Prague, we are led to conclude that zinc and aluminium, two printing substitutes for the litho stone, are still little known in the land which gave birth to the inventor of lithography.

To be brief, the invention of Professor Mares consists of chemical solutions, one of which he claims prepares the printing surface and the other one etches the transfer after it has been laid down in such a novel way that it likely to revolutionise lithographic printing. By the inventor's methods the surface is so prepared that work of all medas can be put on one plate and made-ready for press work without any difficulty. The inventor's etch chemically changes the zinc, so that after it has been etched it will neither receive nor retain grease matter; therefore alteration can be easily made and transposing of subjects on the plate is possible, without fear of ill consequences. Transposing subject may be repeated as often as occasion requires it.

"My method," says the inventor, "eliminates gumming up the transfer and also the use of rosin. Where my chemical solution is used, the transfer pulled over is etched without further ceremony, and due to the fact that my preparation cleans the surface of possible dirt, and nothing further is used which might deposit dirt, or soil the surface, excellent printing results are obtained. Hundreds of thousands of impressions can be printed from a plate which has been prepared by my method, without wear or tear to the plate, without the transfer losing or gaining in any way. My method dispenses with rosin, soap-stone, acid, etc., consequently quicker and better transferring."

This method is claimed to work equally well on aluminium and stone. Any transferrer can adapt himself to that method without undergoing a special training; however, experience in its usage helps greatly to perfect a transferrer in his calling.

The invention consists of, firstly, a sensitising preparation; and secondly, an etching solution.

The surface from which a transfer has to be removed must be powdered over with pumice, emery or carborundum, a small quantity of the first solution which sensitises the surface is then poured over. The solution is distributed by means of a felt-covered dauber, exerting moderate pressure. Thus, the ink of the transfer is speedily removed, with the surface being rendered sensitive. As soon as the surface appears clean it must be carefully washed with clean water, and the plate or stone is ready for putting down the transfer.

On a stone where work had been etched in relief this must be first removed by using pumice or emery powder before the surface is ready to proceed with transferring, as above explained.

The starch sticking to the surface after the transfer has been pulled over must be removed with water, which in turn must be removed also before the second solution (etch) is applied to the whole surface of the plate or stone; for that a sponge is used. The plate or stone is then allowed to dry. After the etching solution is dry the transfer is given an asphalt wash out; washed out with water and rolled up in ink.

Where a transfer is to be etched in relief this can be done by the usual method, or the etched and washed out transfer can be treated with the etching solution instead of using gum, which, after it is dry, renders it ready for printing.

In the press, stone or plate need not be inked up in the evening, nor must it be gummed up, to merely apply the etching solution is sufficient to preserve the printing surface against all harm. — *Lithographers' Journal*, U.S.A.

A De-Inking Process.

A message from Texas states that the *Commerce Journal* is now using a good grade of white newspaper, manufactured by the Trinity Paper Mills of Commerce, from old newspapers de-inked by a special process worked out and perfected by the mill's chemical engineer. The paper is said to be of as good a quality and as clear as ordinary wood pulp newspaper stock.

For the past year this mill has been experimenting in the manufacture of a variety of kinds of paper from cotton linters, and is now successfully manufacturing a good grade of bond paper, book paper, cardboard and blotting paper.

THE day is not far off when colour display advertising will be a feature of the daily newspapers, L. W. Claybourn, of the Claybourn Process Corporation of Milwaukee, told the convention of American Photo-Engravers in session in Chicago.

TRADE "LEADER" MARK
ENVELOPE MACHINES

Better times are just round the corner!

Are you ready?

Yes! better times are unquestionably coming.
Business conditions are rapidly mending, and the demand for envelopes is improving every day.
If you would get your share of the better times, instal the "LEADER" Envelope Folding and Gumming Machine.
The "LEADER" is speedy (over 150 Envelopes per minute).
Reliable, easily adjusted and made by a firm with 60 years' experience.
We are ready to send you prices and full particulars.

Lithographic Trade Review.

NOTES AND NEWS.

THOUGH business in the lithographic section of the printing trade is better than it was at this time last year, conditions generally have unfortunately not maintained the rosy aspect they wore a few months ago. The amount of unemployment among lithographic printers has increased during recent weeks, and it is to be hoped that seasonal briskness will quickly show itself, and establish a movement in a healthier direction.

CLASSES in technology are now getting well into their stride for the winter session, and it is satisfactory to note that, in London at least, the lithographer is being provided for in this respect. One of the centres at which lithographic instruction is available is the School of Photo-Engraving and Lithography at Bolt-court, Fleet street, and a unique feature of the establishment there is the provision of admirable facilities for the training of the litho artist, who is taught all branches of general litho, chromo litho and lettering, the student being also introduced to the use of Day's medium for the production of tints on the stone. Excellent facilities are provided for the practical work necessary, and the equipment includes some five to six hundred stones of various sizes.

FOR the teaching of the litho artists' craft the Bolt-court School employs a full-time instructor, Mr. G. Jupp, and care is taken to give the student as wide as possible a view of the production of the litho printing surface. Stones can be seen in process of being prepared on the premises, and after the artist's work is finished the proving is also carried out on the same floor. Thus the craftsman sees the result of his work and is enabled to understand and correlate the various factors going to perfect the finished printing surface. Trade visitors from America and the Continent, and even from Japan and India, frequently look in at Bolt-court premises, and many are the compliments that have been received in respect of the thorough and practical instruction there given.

MR. ANDREW SPOTTISWOODE has accepted the presidency of the Lithographers' Auxiliary to the Printers' Pension Corporation. The date of the Auxiliary's October concert will shortly be announced.

AMONGST the many speakers at the recent Chicago convention of the American Photo-Engravers' Association was Mr F. P. Douthitt of Detroit, the president of the corporation handling the Douthitt Diaphragm Control. In the course of his remarks he said: "It is possible to complete the average half-tone plates, as far as the actual etching is concerned, in the flat bite and secure better results than can be secured with any amount of staging and re-etching. I believe there is only one reason for this condition, and that is, there has not been a perfect balance as to transposing the different tone values into dot formation, due to the fact that there has never been any effort made to educate the operators to the simple optical laws that control the proper handling of the screen separations and the squared relations of the screen openings, the stops and the exposure times."

MR. DOUTHITT advocates that, in regard to the niceties of getting a picture down on to the metal, reliance should be placed upon scientific apparatus rather than upon the artistic sense of operators. In any method of photography, he says, the use of small stops means that a negative carrying softness and detail will be secured if the time is properly balanced to the stops used; while the use of large stops, and time balanced to these will mean greater contrast and brilliancy. The Diaphragm Control places in the hands of the photographer an instrument which gives him the correct balances as to screen separations, stops and the time to secure any degree of softness or contrast that it may be necessary to secure in the desired negative.

THE most appropriate offset printing paper we have seen came to hand from a London house recently. Especially prepared for colour and photo work, the finish was right and the colour brilliantly white. Only a few days previously we had received a sample of an offset parchment paper for letterheads, etc. In this case, too, the result was just about 100 per cent. In both instances the paper was made by home mills. One of our leading papermakers recently essayed to produce the real offset cartridge and missed the mark by a big margin. Now we hear of mills and merchants instructing their representatives to keep an eye on offset printing and the class of paper required for the process. There is a great risk of them being wrongly instructed. It is well that papermakers should keep track with offset printing progress, for it is passing through a transitory phase. Advertisers are grasping the possibilities of photo and colour work on non-coated paper. So far there are not a great many rotary offset presses at work in this country, but there is a declining number of flat bed stone machines, which distinctly marks the tendency.

OVER in U.S.A. there is a prodigious amount of printing being done by the rotary offset press, including every class of work—colour, poster, advertising, commercial, and even what is commonly called letterpress. Every paper merchant and practically every manufacturer has his offset speciality paper and some very fine papers are being made. The chief characteristic is a firm surface with a nap or a skin on it. Clear bright whiteness is usually an essential. Coated and esparto papers are not desirable; antique printings are too loose and soft, except in the higher grades. M.G. poster leaves too much lint on the blanket. Ordinary M.F. printing is too weak to take a body of colour. Cartridge is all right if the colour is good and the substance not too thick. For commercial headings, policy forms and similar work, the best type of paper is that which we can best describe as an American bond. Very few English mills have yet learned the knack of imparting that peculiar surface skin to their bond papers.

Trade Notes.

RECEIVING ORDERS have been made in respect of Mr. E. G. Pearse, trading as Severn Valley Paper Co., 81, Malvern-road, Worcester, paper merchant; also in respect of Mr. T. G. W. Henslow, 125, St. George's-road, Pimlico, and Temple-chambers, Temple-avenue, London, E.C., journalist.

ST. CLEMENTS PRESS, of Portugal-street, Kingsway, announce that in order to cope with increasing business in the Westminster district a branch opened on October 1st at Abbey House, 2 8, Victoria-street, Westminster. The same firm recently opened a new City branch at 62, Moorgate, London-wall.

"DAILY HERALD'S" FUTURE.—A joint meeting of the General Labour Council and the Executive of the Labour party was held in London on Thursday, and the position of the *Daily Herald* was considered. Though the full amount of £12,500 fixed by the Trade Union Congress at Plymouth has not yet been received the response has been sufficient to allow the Committee to undertake the financial responsibility of continuing the paper until the end of the year. A special Congress is to be held in December to determine the fate of the paper.

THE announcement in the press of a new evening paper and a new Sunday paper, to be published in Manchester, has been followed by the statement that the *Daily Express* is preparing an evening paper for London which, it is understood, will in size and appearance be very much like the *Evening Standard*. Lord Rothermere's name is mentioned in connection with sensational rumours of a newspaper combine.

THE *Morning Advertiser*, the last London daily newspaper to be set up by hand, now announces its conversion to the linotype.

THE united district rally of the Master Printers of the South-East, South-West and Thames Valley districts of the L.M.P.A. held on Tuesday last at Johnston's Restaurant, Wimbledon, was in every way successful. Mr. E. G. Cole, president of the South-West L.M.P.A. was in the chair, and the principal speakers were Mr. R. A. Austen-Leigh and Mr. C. Arthur Bates. A full report of the proceedings will appear in our next week's issue.

THE October meeting of the Association of Master Printers of South-East London will be held on Tuesday the 9th inst. at the "White Swan" Hotel (facing the Crystal Palace), Upper Norwood, at 6 p.m., when Mr. W. J. Parrish will give an address on "How to Get More Printing Business."

THE Printers' Managers and Overseers (Parent) Association is arranging to hold a whist drive in London on November 27th to celebrate the 30th anniversary of the founding of the Association.

THE Amalgamated Typefounders' Trade Society has arranged an evening concert at Shoreditch Town Hall on Saturday, October 20th, at 7 p.m., the proceeds to be given to the fund for the endowment of a bed at the Caxton Convalescent Home, Limpsfield. The chairman is to be Mr. S. H. Caslon, with Mr. G. P. Reveirs as vice-chairman, supported by Messrs. J. Shanks and R. H. Stevens. Mr. H. Bullen-Sanders is the musical director, and tickets may be obtained at the head office of the Society, 80, Blackfriars-road, or from the hon. secretary, Mr. B. Vincent, 18, Ruckholt-road, Leyton, E.10.

ROCHDALE and District Printing Trades Guild held their annual meeting and smoking concert last week, an excellent programme being provided. There is a slight loss on the year's working. Arrangements were made for the coming winter session, which include whist drives, dances, etc. The committee and officers for the coming year were elected. Mr. Ormerod, of Ormerod Bros., printers and lithographers, was elected president. Mr. W. Ashworth undertook the duties of secretary for a second year. Billiard teams have been organised in the various workshops to compete for the trophy presented last season.

MR. HARRY FIELDHOUSE, who has died in London after being knocked down by a motor-cyclist, was the founder and proprietor of the first daily newspaper of Nuneaton, the *Midland Daily Tribune*. He also owned the *Police Chronicle* and the *Leamington Chronicle*

THE death has occurred at Knaresborough of Mr. Thos. Horseman (64), printer.

THE death occurred on Tuesday, at Downes, near Crediton, of Lady Mackinnon, wife of Sir Lauchlan Mackinnon, for many years managing director of the *Melbourne Argus* and the *Australasian*.

AT a meeting of the Preston Court of Common Pleas last week, Mary Hannah Hallewell was awarded £50 damages for libel against the *Preston Herald* Publishing Company The libel complained of was contained in a report of bankruptcy proceedings, which described the plaintiff as "prisoner" instead of "debtor."

BECAUSE of "cuts" made in his novel, "Gloria," appearing serially in the *Referee*, Mr. Stephen McKenna entered a motion to restrain alleged infringement of copyright against the proprietors, printers and publishers of that newspaper, and this was heard in the Vacation Court last week. For defendants it was offered that no further omissions would be made (except with regard to one episode), and this was accepted. The matter accordingly stood over without any order being made.

A MAN was fined 10s. on Friday for defacing a railway poster at Willesden Junction Station by drawing upon it with a pencil.

A SPECIAL Fleet-street Week in aid of St. Bartholomew's Hospital is being arranged between October 22nd and 28th.

THE tie for the last qualifying place in the London Press Golfing Society's Challenge Cup Tournament was played off on Monday at Moor Park. As a result, Mr. H. Rountree secured the last place.

A FINE First Folio Shakespeare is reported to have been discovered in the library of the Thomason Civil Engineering College, Roorkee. The library is in touch with the British Museum on the matter, and investigations in respect of the genuineness of the volume have commenced.

THE American Publishers' Association announced last week that the New York morning newspapers were able to arrange to be published separately after having been issued for nine days in a combined form. This indicated that the machinists' strike was ended.

HELP FOR GERMAN PRINTERS.—A gift of $1,000 has been offered by branches of the German-American Typographia in St. Paul, St. Louis and Indianapolis (U.S.A.), in aid of the Verbande der Deutschen Buchdrucker.

Type Composition of Oriental Languages.

By F. A. J. BURNS,

Of Messrs. BURNS, BAILEY & CO., Manor Park.

Owing to the insular mind of most Britishers, they cannot conceive for the life of them why if the Roman character used in printing is good enough for us, other nations should not use the same character; and in respect of the affairs of other nations this has been our fixed attitude, with the result at the present time that if a tribe is not strong enough to resist the innovation they have to have the Roman character, often with most disastrous results, and if they *are* strong enough to resist, they continue to use their own native character, and while we are with them they have Roman as well.

In dealing with this subject we have to remember that the Roman character with its 26 letters, many of which are interchangeable, has very great limitations when we attempt to use it to represent the very complicated sounds of foreign languages. Even on the Continent we have the nasal and guttural sounds strange to our ears, and when we get further afield there are the aspirated consonants of Indian languages, the tones of China, and the "clicks" and "clacks" of some of the African tribes. However, there

ARABIC.

HINDI (Devanágari).

१ पहिली बात परमेश्वर जो अनादि
जनन्त अविनाशी पवित्रसय भर्मखरू प पापर

HEBREW.

בצאת ישראל מבאר שבע, מבית-אביו, ויברה
יעקב שרה-אדם, ויחלום והנה ה' נצב עליו לשמרו

are an enormous number of languages which use the Roman characters exclusively, and in printing this kind of work it is surprising what curious signs have to be put over, under and through the letters of our alphabet before we can get on with the job.

Influence of Materials on Lettering.

Our forebears in the early days of the world, in expressing their thoughts in visible form, exhibited an enormous amount of ingenuity. Their material, for instance, was chosen from what they had plenty of. The old Hebrews, a strictly pastoral people, used the blade bones of their sheep to write on, whilst the Assyrian and Babylonians, in a land where there was plenty of mud everywhere, used clay in a moist form and with a series of types of arrow-head shape, made a most extensive library of books. Then there are the countries which abound in great rocks with sheer straight faces of tremendous height. These no doubt delighted the heart of the pill and beef-tea manufacturers of those days, so that they said one to another, "Go to, why should we not proclaim our wares on these great hoardings?" and they sent an order to the printer, and, there being a shortage of paper (as it was not then invented) said printer sent his comps down with their mallets and shooting sticks and they cut the announcement into the rock for all men to see, and sometimes they filled the letters up with lead for durability. A noticeable feature of all alphabets which have originally been used for cutting into stone is the use of straight lines. Our letter A is an example of this and shows that the implement used to a very great extent determined the shape of the letter—in this case chisels. In many other countries the materials most plentifully to hand were found on the banks of the great rivers, and the great flat reeds, or "papyrus," formed the material used for writing upon. Here again the material very much influenced the form of the letters, and these languages, such as the Laotian (shown herewith), have characters of circular form, as straight horizontal strokes written by an iron pen or stylus would cut into the vein of the reed and so split it. Further on in the history of the world we find skins or parchments become the material more generally used, until later paper in various forms came into use.

Some Practical Difficulties.

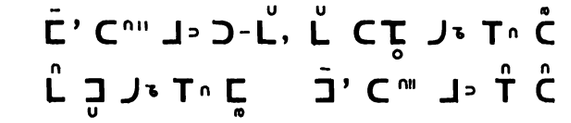
One of the characters most extensively used at the present time is the Arabic. Almost without exception wherever Mohammedanism is prevalent, the Arabic character is used to represent the language. From the printer's point of view it is a most annoying character. In its elements it is quite a simple alphabet, but then they must needs have in most cases one sign when the letter begins a word, another sign when it is in the middle and another when at the end of a word. Then the vowels are little marks either on the top or bottom of the letters—which all adds to the difficulty of setting it in type.

CHU YIN.

ㄈㄨ ㄎㄨㄥ ㄒㄧㄤˇㄌㄞˊ
ㄍㄨㄛˊ ㄐㄧㄚ ㄧㄡˇ ㄊㄧㄢ
ㄒㄧㄚ ㄓㄨ ㄧˋ ㄓㄨㄥ
ㄉㄧˋ ㄧㄡˇ ㄌㄧˋ ㄕˇ
ㄒㄧㄥ ㄧㄡˇ ㄌㄧˋ ㄕˇ
ㄈㄨ ㄎㄨㄥ ㄒㄧㄤˇㄌㄞˊ

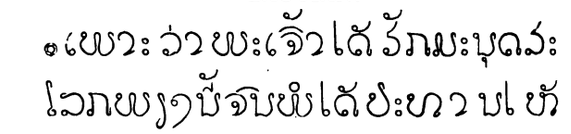
Then there is the very flowing form of this character known as "Talique," greatly developed by the ancient scribes of Persia. In this the characters flow downwards to such an extent that in type most of them have to be cast in duplicate or triplicate on different alignments so as to get the proper effect. It is not surprising, therefore, that much of this kind of work is copied out carefully by hand and produced by photo-lithography or line blocks. However, in present-day practice the ordinary Arabic is mostly used, and the little vowel marks omitted. By the way, these small vowel marks are generally on 3-point body, and it is quite an experience to set a 36 em measure line and to spend quite a time getting them neatly arranged over the top of their respective consonants, and, just as you are squeezing in the last space, the line springs in the middle and you have "pied" the lot. The native compositors' custom of ejaculating "Allah wills it!" and knocking off work for the rest of the day, has led to the elimination of these small lines and the consonants of words only are given, and the reader deciphers the rest.

In Hebrew composition the little game with the 3-point spaces is in evidence again, only more so. The system of vowels is much more complicated, and there are a large number of reading signs which come in the top and bottom 3-point lines. As this makes type-setting very costly, we get pointed Hebrew and also unpointed Hebrew without these minute lines, but which leaves quite a lot for the reader to fill in.



Languages of India.

I suppose of all the countries on this globe of ours India has given more trouble to the letterpress printer than any other. It is estimated that there are about 60 different kinds of script necessary to represent the 400 odd languages of that vast country. For a printer to deal with all these is a most herculean task; but not many Indian printers attempt to do this. Most are quite content to deal with the script of their own particular locality. In many of the larger firms, however, a great number of scripts have to be composed, and owing to the great divergence in the races of India, there is not much similarity in the characters, so the problem is sometimes a very difficult one. It is a noteworthy example of British enterprise that it was a handful of Baptist missionaries, only one of whom knew anything of printing, who first started and produced on a large scale books printed in these scripts from movable type.



In the scripts based on the Devanagari characters, such as Hindi, the difficulty of the little top and bottom signs is a real problem. They cannot be dispensed with, as they form in some cases an integral part of the characters. Various devices have been adopted from time to time to expedite the composition of these languages. I designed some years ago a special form of Hindi, in which we had the main characters cast on two sizes of body, the top pieces being dropped in on top of the small sizes. In some of the other languages, notably Bengali, the top pieces are cast overhanging, and duplicates are also cast with a part undercut; these then lock one in the other. The most simple Indian character is the Tamil, which has a syllabary of only about 150 characters.

Many attempts have been made to represent these languages by Roman characters, and vast sums have been spent by the Indian Government and private societies to propapate them, but at the present time only one Indian language uses it to any extent, and that is the Urdu or Hindustani, the Arabic character being used as an alternative. It is worthy of remark that the principal languages of India are based on Sanscrit, from which most of them spring, and which is the most scientific alphabet, or rather syllabary, in the world, as it puts the vowels in their proper order and the consonants into classes according to the organs used to produce them.

MIAO (W. China).

LAOTIAN.

The Problems of Chinese.

Now we come to Chinese—the dismay of the Western printer. It may be called the language of the one-em quad, as its composition is simplicity itself, all its characters being on the square of the body—quite easy, when you know the language and have the "sorts." I have lately been in correspondence with a Chinese firm to supply a fairly complete set of matrices. The smallest serviceable fount consists of 6,800 characters and to be a really live Chinese printer you want about ten to a dozen different sizes and styles and then, for fairly average bookwork, 10,000 different characters may be required. Here, you will say, there is surely room for simplification in type setting. Well for over 100 years Westerners have done their best to introduce Roman characters into China, and at the present time not one district of this immense country has taken to it. The only really serious rival to the old Chinese hieroglyphics is the Chu Yin, or National Script, which, although permanently adopted by the Chinese Government, is intended to be used only for teaching illiterates.

As will be seen from the example shown it is nothing but a simplified form of the Chinese character.

The Chinese language, which is probably one of the oldest in the world, is most interesting. Unlike the Sanscrit, which has a physiological basis, Chinese has a pictorial basis, and each character originally was a crude picture of some idea. This leads to an immense number of characters. All these have

Summary of lecture delivered last week before the Association of Master Printers of E. and N.E. London at Stratford.

Digitized by Google

been classified into what are called radicals. In Chinese there are 214 radicals, each radical being classed according to the number of strokes of the brush used in making it. The compositor having his cases on three sides of him, and knowing the radical class each character belongs to, can readily pick out what he requires. The type is read in columns from top to bottom, and the columns are placed from right to left, the title being the position of the last page of our books.

Initiating a Printed Language.

A problem which sometimes presents itself to a foreign language printer, and which has it been my privilege to deal with a number of times is that of printing a language for the first time. This problem divides itself naturally into two parts, languages which have no written form at all, and secondly those which have a written form but have never been produced in printer's type. The first class is undoubtedly the most numerous, and in most cases Europeans have been the first to reduce such languages to writing. They have generally used the Roman character, and by placing all sorts of fancy marks over and under the letters, have endeavoured to represent the strange sounds necessary. This is not always so, however, and we find, as in the case of the Miao language considerable ingenuity has been displayed and a most scientific system evolved. A missionary, the Rev. Samuel Pollard, went out among the Miao tribes of Yunnan Western China. These tribes are quite distinct from the Chinese, and had no written language of any kind. Pollard set to work and after much study learnt their language. His next task was to produce it on paper. Being an Englishman he naturally turned to the Roman character. This he found quite unsuited for his purpose, so he struck out an entirely new line and invented a new script. This was formed (see example) from some sanserif letters, the signs of Pitman's shorthand and some Braille characters. He now brought his script to England and offered it to a society with which I was connected, and I was deputed to draw the designs and make matrices and type, from which the first books were printed in this language.

The second class of languages—those which have a written script already in existence—also present special difficulties. The example shown herewith, Laotian, is a case in point. This was also brought to us by a missionary—a Frenchman this time. By dint of much study he had learnt the language of these tribes living in Annam and parts of Cochin China. They had a considerable literature of reed books—a book consisting of long, flat reed upon which the characters had been scratched with an iron style and a black pigment rubbed into the marks thus made. He brought to us one of these reed books, also a few sheets of a copybook in which a native had laboriously scrawled lines of the various characters in use—the first time by the way he had ever handled a blacklead pencil—and a copy of a book which the Frenchman himself had translated and written out. We first had to draw large accurate designs of these characters, which were approved by our friend, then decide how we could set most economically the various size characters, and afterwards made matrices and cast types from which we produced the first books in this language. From the specimen it will be observed that the characters are of various depths and some are placed over others. To make all these fit together accurately everything was cast both ways on five points or multiples of five, much as music type is set.

Mechanical Composition.

In conclusion I will touch on the application of mechanical composition to foreign languages. For Russian, German and Greek characters, the monotype has quite a good assortment of matrices, and we find a fair quantity of work in these languages. For Hebrew we have three sizes on the monotype—which I believe are the only matrices yet issued in this character for that machine. For Chu Yin, the new national script of China, we have a set of matrices for the monotype. The other languages here described have yet to be composed by machine. I have given this subject a good deal of study and have worked out a scheme for mechanically setting the Marathi language of India on the DD keyboard, which will automatically set the small top signs I have previously referred to without any spacing on the part of the operator. We are also working out a scheme for setting the 10,000 Chinese characters on one keyboard and casting them from a specially adapted caster.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Gray's Inn-road, London, E.C.1.

Occasionally we have Rebuilt Smyth Book Sewing Machines to offer, such Sewers having been thoroughly overhauled and refitted with New Standard Parts where necessary. We erect and teach on a trial basis.—Box 13993.

Miscellaneous.

WASTE PAPER: ITS RECOVERY AND RE-MANUFACTURE. By Jas. Strachan. A Fund of Information; price 12s. 6d.—Stonhill and Gillis, Publishers, 58, Shoe-lane, London, E.C.4.

Sectional View of Winkler Casting Machine.

We print again this especially interesting sectional view of the Winkler casting machine, as it was wrongly shown in last week's issue when we described the Winkler apparatus. This illustration makes very plain the position of the molten metal, the weight of which is utilised to the full in getting a true and solid plate. The position of the furnace, the water-cooling arrangement, etc., will also be noted.

Representatives also in Australia, India, South Africa, Canada, etc.

THURSDAY, OCTOBER 4, 1923.

Advertising.

"A PRINTER and his Own Advertising" is the title of the striking address by Mr. W. H. Sessions, of the Ebor Press, York, delivered at last week's meeting of the West and North-West London Master Printers' Association. That the subject is an important one will be generally agreed, for every one is interested in advertising; the only difference in our interest lies in the point of view. We are therefore printing the paper *in extenso*. Mr. Sessions is an undoubted authority upon this subject, his previous contributions having been of great value to the live student of up-to-date methods. We are in entire agreement with his view that the average printer does not make the most of his business. At a time like the present, when things are perhaps as hard as they can be, there must be a great amount of printing plant lying idle. Why? Mr. Sessions himself supplies the answer. The advantages of specialisation to-day are so manifest that it is almost a reflection upon the trade that so little of it should exist. The adoption of specialisation tends not only to eliminate competition but also to utilise existing plant to the greatest possible extent. The slogan for printers should undoubtedly be—"Find your own line, and boom it!" Advertising should, however, in all cases be undertaken systematically. The most successful amongst the advertisers in our own pages are those whose announcements are continued year in and year out. This is probably the finest recommendation that advertising could have, since it proves Mr. Sessions' assertion—"We know how we read the advertisements in our own trade papers." Mr. Sessions, in his concluding remarks, said: "I am satisfied that we printers do not do enough advertising, and a good deal of the advertising which is done loses much of its force because it is a fill-up for spare time and not part of a definite advertising campaign." Mr. Sessions' paper gains in value in that his own commercial success is due to the system that he propounds.

Prices of Paper.

PAPER prices are now on a very firm level and most of the distributing houses have issued their revised lists. The movement has not been all in the one direction, for we note many cases where reductions have recently been made, principally affecting tub-sized papers. Engine-sized writings and printings have settled firmly enough on the slightly higher level which was reached some months ago when wood pulp quotations soared. Coated art papers, for which the demand is poor, have found a slightly lower level, probably helped in that direction by the noteworthy increase in the import of German coated papers. The latter are being offered by several merchants at 4½d. and 4¾d. per lb. Standard English art papers are quoted 5¼d. and 5¾d. per lb. The finest art paper with esparto body and a flawless surface prepared for three and four-colour process work is listed at 6d. per lb.

* * *

Board Thickness.

ONCE again force of circumstance leads us to draw attention to the imperative need of a better standard of specification for the thickness or substance of boards. This section of the trade is conducted along lines of absolute chaos so far as the user is concerned. The difference in substance between what one maker described as a five-sheet pasteboard and that supplied to the same specification from another source, recently led to a rejected job and a closed account. Under existing conditions there is absolutely no meaning in the term three-sheet, four-sheet or whatever specification of this kind is employed.

Trade Union Matters.

L.S.C. AND PERIODICAL WORK.—At last week's special delegate meeting of the London Society of Compositors, consideration was given to the Society's proposals in regard to piecework in periodical houses. These proposals, generally speaking, were endorsed by the delegates, the Committee's suggestions being in some respects made more drastic. It was agreed, among other things: That all composition, apart from displayed advertisements, be produced on piece; that the minimum rate for time hands be 2s. 6d. per hour; that time hands operating the Ludlow plant be paid at the rate of 2s. 8d. per hour; that when composition on the Monotype keyboard is produced on piece, the rate be 5¾d. per 1,000 ens corrected or 5d. per 1,000 ens uncorrected, also that Monotype operators have a minimum wage of £6 weekly guaranteed.

L.S.C. AND NON-SOCIETY COMPOSITION.—An official notice of the London Society of Compositors issued to chapel officers, intimates that machine composition sent from a non-society house must not be handled by members.

T.A. MEMBERS AND THE FORTNIGHT'S NOTICE.—The secretary of the Drogheda Branch of the Typographical Association has reported to the headquarters that a member had been discharged from an office owing to slackness of work, and that the firm had refused to allow him to work out a fortnight's notice. He had been employed in the office for thirteen weeks. The Executive Council decided to instruct the secretary to press the point of the fortnight's notice and also to claim *pro rata* holiday money for the period employed.

TYPOGRAPHICAL ASSOCIATION AND WAR ORPHANS.—At a meeting of the Executive Council of the Typographical Association a letter was read from the joint secretaries of the Joint Industrial Council appealing for funds on behalf of the Printers' War Orphan Fund. It was stated that several printing trade unions had considered the matter and decided to make substantial grants to the fund of the Executive Council, after consideration of the appeal, directed Mr. French (the General President) to make inquiries as to the number of children of members of the Typographical Association who were receiving benefit from the Fund before a final decision as to financial assistance was come to.

Personal.

Sir Hall Caine was entertained at luncheon on Thursday by Messrs. Cassell and Co., Ltd., in celebration of his 70th birthday. Sir William Berry presided, and Mr. T. P. O'Connor proposed the health of the distinguished guest.

Mr. T. P. O'Connor, M.P., has agreed with Messrs. Cassell and Co. to become editor of *Cassell's Weekly* under the new title of *T.P.'s and Cassell's Weekly*. Mr. O'Connor will enter upon his new duties almost at once, and the first issue under his editorial direction will be published about the middle of October.

Mr. Winston Churchill will preside at the "Honorary Members' Night" of the London Press Club in February next, when the guests will include Lord Riddell, Sir William Berry, Colonel Lawson, Mr. R. D. Blumenfeld, and Major J. J. Astor.

Mr. William Will, the manager of the *Graphic*, has made a handsome gift of books to the library of the London Press Club.

Mr. H. A. Phinney, president of the Cross Paper Co., Boston, Mass., whose London office is at 92, Fleet-street, E.C.4, is now on a visit to the United Kingdom, this being his 21st trip to this country.

It was in 1906 that Mr. Phinney first visited London, with the object of developing the sales of the Cross Paper Feeder, and since that time the earning capacity of the machine has been well demonstrated, with the result that it has been freely installed by many leading firms, one house having no less than 90 in operation.

Mr Phinney intends visiting the Continent before returning home at the latter part of the month.

Mr. T. F. Styles, of the Canadian-American Machinery Co., Ltd. London, is on a short trip to the United States.

Mr. Wm. H. Sessions, whose lecture on printers' advertising we are reporting this week, is exceptionally well qualified to speak on this important subject. He is a Fellow of the Incorporated Society of Advertising Consultants as well as being managing director of the Ebor Press, York.

Mr. Chas. T. Jacobi is lecturing to day (Thursday) at the Central School of Arts and Crafts, Margaret street, Birmingham, on "The Advantages of Simplified Typography," the chair being taken by Councillor Percival Jones, president of the Birmingham Master Printers' Association.

Mr. W. H. Burchell, founder and first hon. secretary of the Printers' Managers and Overseers' Association, had a cordial reception on Tuesday at the Old Bell, Holborn, when he addressed the Parent Association on "Profitable Printing Office Management."

We are glad to learn that improvement is reported in the condition of Mr. T. Timberlake, chairman of the London Society of Compositors, who lies at the Charing Cross Hospital, having undergone two operations.

Mr. William Allanson, a member of the board of directors of the Darwen Industrial Co-operative Society, is a candidate for the position on the directorate of the Co-operative Printing Society, Ltd.

After completing 52 years of service with the firm of W. H. Smith and Sons, Mr. William Charles Smart, manager of the newspaper department at Strand House, is about to retire.

Mr. Smart is to be succeeded by Mr. C. W. Kimpton, who has spent over 32 years with the firm.

Mr. G. W. Spencer, the doyen of Buckinghamshire journalists, has retired, after having been a reporter on the same newspaper for over 50 years.

A lecture on the League of Nations is to be delivered by Mr. L. J. Maxse, the editor of the *National Review*, in the Kingsway Hall, London, on November 2nd.

Sir Frederick Sykes, son-in-law of Mr. Bonar Law, has joined the directorate of the *Daily Express*.

Mr George W. Russell, who goes by the pen-name of .E, is to edit the *Irish Statesman*, of which the first number is being published in Dublin. It is stated that in order to obtain Mr. Russell the proprietors of the *Irish Statesman* had to buy up the *Irish Homestead*, an agricultural journal Mr. Russell has been editing and to incorporate it in the new journal.

Mr. Alexander Grant, who for nearly six years has been Director of Publicity at the Ministry of Pensions, has re-joined the London staff of the *Glasgow Herald*.

Mr. James Sykes, a past president of the Institute of Journalists, who has been for 21 years chief assistant editor of the *Yorkshire Post*, has retired, after 50 years in journalism.

The engagement is announced of Mr. L. Raven-Hill, the well-known *Punch* cartoonist, to Miss Marion J. Lyon, advertising manager of *Punch*. Miss Lyon is described as "The cleverest woman in advertising of the day."

Mr Stephen Graham is to be the first of a series of lecturers to address the Society of Bookmen meeting at Stationers' Hall. The date and his lecture is October 9th.

THE POISONING CASE AT Messrs. Fry's Metal Foundry.

The prolonged coroner's enquiry into the sad fatality at Messrs. Fry's Metal Foundry on July 10th was concluded on Friday last, when Dr. Waldo, Coroner for the City of London and the Borough of Southwark, returned a verdict that the unfortunate man, Wright, met his death as a result of heart failure, caused by poisoning by arseniuretted hydrogen gas, that the death was by misadventure, and that no blame was attributable to anyone.

The case has been investigated by the Home Office authorities, and by a number of eminent medical men, and also by the Government Chemists Department, Messrs. Fry's own technical experts giving every facility and assistance. The following is an authoritative account of the occurrence.

The heavy rain caused a surcharging of the drains and gullies, the overflow led to flooding of the floor of the foundry, and a number of sacks of metal skimmings and residues were wetted. The material was stored in a normally dry place but in the special conditions it became soaked. This material, which is quite distinct from, and different in character and composition from, printers dross, contained aluminium, with sulphur, oxygen and arsenic. It is the residue from a special refining operation, and being of no value was awaiting removal to a waste dump. Evidently the aluminium was to some extent combined with sulphur. This compound is known to give off sulphuretted hydrogen (a gas which smells like rotten eggs) when acted upon by water. What is more serious, however, the arsenic compound was also decomposed, and arseniuretted hydrogen evolved, the garlic like odour of which was masked by the sulphuretted hydrogen. Arseniuretted hydrogen is a very poisonous gas, and evidently the unfortunate man Wright, inhaled sufficient to cause his death. His workmate, Lewis, who was equally exposed to the gas, was not affected at all, and a third man Driscoll, who was near, became ill but has now recovered. It thus seems evident that certain persons are more susceptible than others.

No trouble has been spared in investigating the matter, and no parallel to the case is known in the history of metallurgical manufacture. It is recorded that a French scientist had succeeded in preparing a compound of aluminium and arsenic in the laboratory, and this has been repeated in the investigations of Mr. Mundey of Fry's but that it should have been spontaneously produced with such sad results, was undreamt of, and even now it is by no means proved that the gas was evolved from this compound.

Joint Industrial Council.

Interesting Gathering at Weston-super-Mare.

To develop the work of the District Committee was the object of the members of the Cardiff District Council of the J.I.C. in meeting at Weston-super-Mare on Saturday last at the invitation of Mr. Frank Murrell.

It was not a large gathering, but Mr. E. W. Holder made an excellent chairman and the joint secretaries, Mr. Ford and Mr. Baker are irrepressible enthusiasts.

After the conveying of the apologies of the absentees and a lament over the fact that the minute book had been left on the boat, there was quite an animated discussion on the past work of the committee and its future possibilities. Mr. A. E. Holmes had expected to be present but wired his regrets and good wishes for a successful meeting.

Mr. A. E. Goodwin expressed pleasure at being present and congratulated Cardiff on the example set to other areas. Although the Holiday Home scheme had been abandoned for the time being, he hoped later on that Bristol and the south-western printers would combine in another effort to start a Convalescent and Holiday Home in Weston or neighbourhood. He referred to the work of the National J.I.C., to the activities of the Health Committee, and the many occasions on which the Council and its Conciliation Committee had prevented disputes extending, and gave instances of several recent settlements that had not been made public. He pointed out that the greatest need to-day in the industrial world, as in the political world, was to understand the point of view of other people. The J.I.C. provided opportunities for full and frank discussion of many problems now troubling the industry. It was easier sometimes to create strife than to secure peace, but everyone desired a period of peace in industrial circles. He congratulated the committee on their suggested programme of educational work and promised ready support.

A series of lectures to be given at the Cardiff Technical College during this session in connection with the printing trade was arranged, and should be of more than ordinary interest to the industry. Among the lecturers with whom dates are to be fixed are Mr. J. R. Riddell, principal of the London School of Printing; Mr. George Isaacs, general secretary of the "Natsopa," who will be speaking on health conditions in factories, with special application to printing trade offices; Mr. R. B. Fishenden, of Messrs. Stephenson, Blake and Co., Ltd., of Sheffield and Manchester; Mr. Frank Colebrook, F.A.I.; and Mr. Goodwin, the secretary of the F.M.P.

The members of the committee and their wives were entertained to tea and to quite a delightful impromptu programme of music and dancing.

Hearty thanks to Mr. and Mrs Murrell were voiced by Mr. Holder, supported by Mr. Ford and Mr. Young.

DIVIDENDS AND REPORTS.

RAPHAEL TUCK AND SONS.—Preliminary statement for year ending April 30th, 1923, shows profits, after providing for directors' and managers' remuneration, of £41,481, against £42,136 for previous year. Balance dividend of 6 per cent., making 10 per cent. for year (same as for 1921–22); £2,577 to special dividend reserve (against £2,795), and £5,881 forward, against £5,727 brought in.

ASSOCIATED NEWSPAPERS.—Interim dividend on deferred shares for quarter ending September 30th of 2s. per share, *i.e.*, at the rate of 40 per cent. per annum, less tax. Warrants will be posted on October 5th.

INTERNATIONAL LINOTYPE.—Interim dividend at 2½ per cent. to September 30th, 1923. Warrants will be posted on October 31st.

JOHN DICKINSON AND CO.—Dividend at the rate of 8 per cent. per annum, less tax at 4s. 7½d.

CROPPER AND CO.—Accounts for year ended June 30th, 1923, after providing for depreciation, etc., show a net loss of £8,468, to which has to be added £5,501 for interim dividend on Preference shares, making £13,969; from this amount was deducted credit of £5,149 brought forward and £3,820 excess profits recoverable, leaving £4,001. Directors have decided to pay on September 27th the final dividend on Preference shares, which will make a total debit balance of £9,502 to be carried forward.

NEW COMPANIES.

WALDORF PRESS, LTD.—Capital £100, in £1 shares; publishers, printers, importers and exporters of and dealers in all kinds of printing machinery, etc. Private company. Directors: C. L. Mitchell and E. A. Ling. Registered office: 149, Strand, W.C.2.

BLOOM BROTHERS (PRINTERS), LTD.—Capital £1,000, in £1 shares; printers, lithographers, bookbinders, paper gummers, gold and silver blockers, die stampers, engravers, etc. Private company. Subscribers: W. W. Bloom and E. Bloom. Registered office: 64, The Wicker, Sheffield.

BRISTOL GUARDIAN AND GAZETTE ASSOCIATED NEWSPAPERS, LTD.—Capital £4,000, in £1 shares; to acquire the business of the *Bristol Guardian* carried on by F. Witty, J.P., at 23, Bridge-street, Bristol, to acquire and incorporate therewith the *Bristol Gazette*, the *Cheddar Valley Times*, the *North Somerset Gazette* and the *South Gloucestershire Gazette*, carried on by the General Publishing Syndicate, Ltd., at 29, Redcliffe hill, Bristol, as part of their business freed and discharged, so far as such incorporated papers are concerned from all liabilities in respect of each of them, together with the whole of the assets of the proprietors of the Syndicate in connection therewith, so far as the four papers are concerned, and no further (except book debts due up to date of incorporation); to adopt an agreement with F. Witty and G. D. W. Stubbs (as managing director of the Syndicate), and a provisional agreement between the Syndicate and Messrs. Hancocks, of Clevedon. Private company. First directors: F. Witty and G. D. W. Stubbs. Registered office: 23, Bridge-street, Bristol.

BRIGHOUSE ECHO, LTD.—Capital £500 in £1 shares; proprietors and publishers of the newspapers known as the *Brighouse Echo* and the *Elland Echo*, etc. Private company. Directors: W. E. Denison, C. Ramsden, R. Ramsden, E. Denison and S. R. Crapnell.

WELWORTH STATIONERY CO., LTD.—Capital £100 in shares; general merchants, factors, commission and general agents, manufacturers, importers and exporters of and dealers in stationery and fancy goods, commercial stationery, account books, office requisites, etc. Private company. Subscribers: E. Funk and L. Civoal. Registered office: Camomile-street-chambers, 36, Camomile-street, E.C.

BAILEY'S AGENCIES, LTD.—Capital £5,000 in £1 shares (3,000 preference and 2,000 ordinary); to acquire from T. D. Bailey and Son, Ltd., the goodwill and connections of their stationery business, "B" department, and to carry on the business of card manufacturers, stationers, gelatiners, varnishers, relief stampers, designers, draughtsmen, publishers, etc. Private company. Subscribers: P. R. Isgar and W. G. Darkin. First directors: E. L. Wertheimer, F. F. Partos, L. Marx and A. E. Cartwright.

THELWALL MUSIC CO., LTD.—Capital £100 in £1 shares; to acquire the business of The Thelwall Rapid System of Sight Reading for Pianists now carried on by W. H. Thelwall at 139, New Bond-street, W., and to carry on the business of music printers, publishers and teachers, etc. Private company. Directors: W. H. Thelwall, H. A. Farman, T. E. St. Clare Daniell, R. Smith, and J. Kidd. Registered office: Bank-chambers, 329, High Holborn, W.C.1.

F. A. SAUNDERS AND CO., LTD.—Capital £10,000 in £1 shares (8,000 7 per cent. cumulative preference and 2,000 ordinary); manufacturers and suppliers of tubes, boxes, cases and other coverings, for goods and packages whether made of paper, cardboard, wood, metal or other material, importers and exporters of and dealers in timber, metals, wood, cardboard and paper, etc. Private company. First directors: A. F. Saunders and W. E. Hiett. Registered office: 7–13, Lavington-street, S.E.1.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

WESTS, LTD. (music printers and publishers, etc., London).—Satisfaction in full on August 30th, 1923, of debenture dated January 23rd, 1922, securing £750.

RIAM, LTD. (type and metal founders, etc., London).—Land registry charge on 17, Canal-road, and 20, Mill-row, both in Shoreditch, dated September 7th, 1923, to secure £400. Holders: Mrs. E. A. Harrison and Mrs. E. J. Robertson, both of 9, The Woodlands, Chesham Bois, Bucks.

STANDARD CATALOGUE CO., LTD.—Issues on June 4th, July 11th and September 20th, 1923, of £4,250 "A.S.C." debentures, parts of a series already registered.

G. E. HANCOCK, LTD. (newspaper proprietors, publishers, printers and stationers, etc., Cleveden).—Debenture dated September 5th, 1923, to secure £100, charged on the company's property, present and future, including uncalled capital. Holder: Mrs. A. B. Jefferies, Stancliffe Boarding House, Clevedon, Somerset.

DONCASTER ROTOPHOTO CO., LTD.—Particulars filed of £4,000 second debentures, authorised June 16th, 1923, charged on the company's undertaking and property, present and future, including uncalled capital, subject to £3,500 first mortgage debentures; the whole amount being now issued.

GRIMSBY TIMES AND TELEGRAPH CO., LTD.—Issue on September 4th, 1923, of £1,000 debentures, part of a series already registered.

LINCOLNSHIRE CHRONICLE, LTD.—Satisfaction in full on June 11th, 1923, of second debentures dated September 6th, 1922, securing £2,750.

STRONG'S LTD. (manufacturing stationers, etc., Manchester)—Charge on certain leasehold land and appurtenances thereto in Bridgewater-street, Salford, dated September 6th, 1923, to secure all moneys due or to become due from company to Manchester and County Bank, Ltd.

PORTALS, LTD. (paper manufacturers, etc., Whitchurch).—Satisfaction to the extent of £30,000 on December 29th, 1922, of first mortgage debentures dated May 17th, 1920, securing £120,000. (Notice filed September 20th, 1923).

THOMAS BROTHERS AND CO., LTD. (paper manufacturers, etc., Bisham, Marlow).—Particulars filed of £15,000 debentures authorised May 2nd, 1923, charged on the company's undertaking and property, present and future, the whole amount being now issued. Also registered mortgage dated September 17th, 1923, as further security for £15,000 debentures, charged on certain lands at Bisham, Berks, with Temple Paper Mill and other buildings, etc., thereon. Holders: Mrs A. A. Thomas, Weir Cottage, Temple Marlow, Berks, and W. E. Thomas, Temple Mills, Bisham, Berks.

PORTSMOUTH AND DISTRICT BILLPOSTING AND ADVERTISING CO., LTD.—Deposit on September 17th, 1923, of deeds of various properties in Portsmouth, Portsea, Southsea and Buckland, to secure all moneys due or to become due from company to Lloyds Bank not exceeding £4,900.

THE *British and Colonial Printer and Stationer* circulates all over the world.

CAXTON CONVALESCENT HOME, - Limpsfield, Surrey.

President—C. J. DRUMMOND, Esq., M.B.E., J.P.
Treasurer—The Right Hon. C. W. BOWERMAN, J.P., M.P.

Devoted exclusively to the use of Men and Women engaged in the Printing, Bookbinding, Stationery, and Kindred Trades. Patients received from all parts of the Country.

A Subscription of Three Guineas annually by an Employer, Society or Workshop gives the right to nominate a Patient each year for a Three Weeks' residence at the Home on recovery from illness.

Penny-a-week Subscriptions from employees are earnestly solicited. Annual Subscribers (minimum 4/-), through a collector or direct to the Office, are entitled to a Three Weeks' stay at the Home entirely free. Wives of men in the trade are now admitted.

Paying Patients: £1 11s. 6d. per week.

EAST & NORTH-EAST
London Master Printers' Association

An Out-of-the-Ordinary Lecture.

A record attendance of members of this association was drawn to the Langthorne Restaurant, Stratford, on Tuesday of last week by the hon. secretary's attractive announcement of a lecture on "Type Composition of Oriental Languages," by Mr. F. A. J. Burns, of Messrs. Burns, Bailey and Co., Braille printers and Oriental language specialists, Manor Park. Expectations were not disappointed, as Mr. Burns gave an interesting and informative survey of his out-of-the-ordinary subject in a lecture which we report on another page.

The evening's proceedings began with tea, a sociable half hour around the tea table serving to make a break with the cares of the day and to strike the right note of comradeship for the discussion to follow. Several matters of business were next dealt with briskly under the chairmanship of Mr. C. H. Ward, before the speaker of the evening was called upon.

Minutes were taken as read, Mr. T. D. Hawkins, hon. secretary, reminding the meeting that the Association's visits to the London School of Printing and to Croxley Mills had both been reported in the *British and Colonial Printer and Stationer*.

A number of items of correspondence were next presented by the secretary. Amongst them was a recommendation from 24, Holborn, proposing a new rule providing for the expulsion of members infringing the rules. This was agreed to. Favourable attention was given to a communication from Mr. C. A. Bates referring to the arrangements being made for the representation of the advertising profession at the British Empire Exhibition. Arising out of a letter from the L.M.P.A. secretary, it was decided to invite Mr. Howard Hazell to address the East and North-East Association in December, and the secretary also referred to correspondence on the subject of costing, with a view to propaganda being undertaken in the district.

Three new firms were elected to membership of the Association.

The meeting then gave close attention to Mr. Burns' paper, the speaker receiving a cordial ovation at the close. Though it was confessed that the subject of Oriental printing was one with which the ordinary printer had little acquaintance, discussion of a conversational character continued at some length. Points dealt with were made clearer by the circulation of printed books which Mr. Burns had brought with him.

Mr. G. F. Tomkin proposed a very hearty vote of thanks to the lecturer, and this was seconded by Mr. Hawkins, sen., and carried with acclamation. The chairman remarked that the amount of discussion indulged in was a compliment to the lecturer's treatment of his subject, whilst the secretary added that the attendance was a record one.

The meeting ended with a brief response from Mr. Burns, who indicated his willingness to deal at some future date with the interesting subject of Braille printing.

Paper Wages Agreement.

Representatives of the Employers' Federation of Papermakers and of the two unions in the paper industry met in Manchester last week, and arrived at a complete settlement with regard to the new wages agreement. The principal alteration concerns a revision of the learners' rate.

Printing Trade in Ireland.

Mr. Williamson, Costing Secretary of the Federation, has paid a brief visit to Ireland. He found on enquiry that although the elections had provided a fair amount of work, trade generally was not good. One printer told him that he was supplying duplicator papers to a certain organisation, and its use had resulted in reducing orders to the extent of about £300 a year. He attributed the decreased demand to the high wages demanded by the Irish printing employees.

Irish Master Printers.

At the half-yearly meeting of the Irish Master Printers' Association a session was devoted to the discussion of the Federation Costing System. An invitation to be present was extended to the members of the Dublin Master Printers' Association, and many members accepted the invitation.

The President of the Irish M.P.A. (Mr. David Irvine, of Londonderry) presided, and urged the necessity of a more general adoption of the Federation Costing System.

Mr. Williamson, F.C.W.A., secretary of the Federation Costing Committee, was present and spoke on the subject of "Reducing the Cost of Printing." He said there were three ways in which the cost of printing could be reduced—1, a greater output by employees; 2, a larger volume of turnover; 3, a reduction of the expenses. He admitted that items Nos. 1 and 2 were difficult propositions, but with reference to No. 1 he considered that by improving the conditions of the departments, providing a regular supply of the necessary materials, by arranging for good natural and artificial lighting, and instituting a systematic clearing of dead matter, output would be improved automatically and unconsciously. The securing of a larger turnover was another difficult matter, particularly under present-day conditions, but the speaker suggested that it was possible to lose a considerable amount of goodwill by a failure to deliver according to promise. As Nos. 1 and 2 were likely to be difficult matters to handle, it was suggested that No. 3, whilst offering possibilities, was not difficult of attainment. Fortunately in the F.C.S. a means was available through which by analysis and segregation the accurate costs of the various operations could be found and checked. It was not until the costs were known that there could be any means found of reducing them. Mr. Williamson then separated a composition rate of 4s. per hour and a machine rate of 4s. 9d. per hour into their component parts. He pointed out that wages were the heaviest item of expense in the composition rate, and equalled the other expenses in the machine rate. Turning to the operations of the Federation Costing System the speaker explained the methods of dividing departments into production centres so that accurate costing of operations could be achieved. Having found the rates to be correct, it was then possible to make comparisons as to the most economical means of producing work. The cost of installing and working the system was explained, and an estimate given as to the time taken to transfer the details to the necessary forms.

In reply to an enquiry as to how the expenses of a newspaper and jobbing business were dealt with, Mr. Williamson explained that expenses in the nature of publication and literary charges were separated from the production expenses so that the manufacturing expenses only appeared in the hourly rates, which were applicable to both newspaper and jobbing work. The gathering together of the times for producing a newspaper was a check on any attempt to load on to a regular weekly job items that belonged to the jobbing side of the business. It was also explained how the expenses of a retail business were segregated and how it might assist the management in discovering leakages.

Mr. Eason, president of the Dublin Master Printers' Association, spoke highly of the value of the Federation Costing System, and explained how it was possible to apply the System to a business with many ramifications and where the factory became the production centre for various sales organisations. He asked how the System could be applied if there was difficulty in securing time records.

Mr. Williamson in reply said that as the Joint Industrial Council had accepted the Costing System under their Constitution they were in duty bound obliged to assist in making it possible to secure time records. As a matter of fact the Binders' Union had given valuable assistance, where objections had been raised.

MR. J. E. WINTON, of Erie Ore, Hastings, is reported to possess a "Breeches" Bible, for which he is desirous of finding a purchaser. The imprint states that it was printed at London by Robt. Barker, printer to the King's most Excellent Majestie 1607; cum privilegio Regiœ Maieftatis.

Charles Letts Diaries for 1924.

Several New Features.

The receipt from Messrs. Charles Letts and Co., of Southwark-bridge Buildings, London, E.C., of a selection from their comprehensive range of diaries for 1924 reminds one of the rapid advance of the year. It also acts as a reminder to stationers and others interested in the sale of these important selling lines to be in readiness before the demand is forthcoming.

As was the case in 1923, Messrs. Charles Letts have introduced several new varieties of diaries that usefully touch different kinds of acticity.

The Scribbling Diaries—which are made to sell at varying prices—are again well to the

fore, and contain their customary mass of usefully arranged information. Another item that will be found of special interest is the Popular Wireless Diary, which is published by Messrs. Chas. Letts jointly with the Radio Press at the moderate price of 1s. It is published entirely in the interests of those who are interested in receiving wireless telephony and is not intended for experts. A large sale is anticipated for this particular issue. Another diary that will appeal largely to a big section of the public is the A.A. Motorists' Diary, which the firm is publishing jointly with the Automobile Association, an organisation which has a membership of about 200,000.

A new feature included in the coming year's publications is the Children's Diary. The cover of this number is of bright coloured art cloth with a picture and holly design; the paper is a pale buff and the printing is in chocolate ink; 64 pages of reading matter are given which deal with such subjects as "What is the Earth?" "Five Great Artists," "Stamp and Butterfly Collecting."

The Scouts' and Girl Guides' Diaries again have a prominent place in the selection, whilst the Business Man's Diary and the Self-Opening Diary maintain their former excellence both as regards production and utility. The "Schoolboy's" and the "Schoolgirl's" Diaries have been reduced in price, but they nevertheless continue to present to their recipients the valuable reading matter and data that have made them so popular in the past.

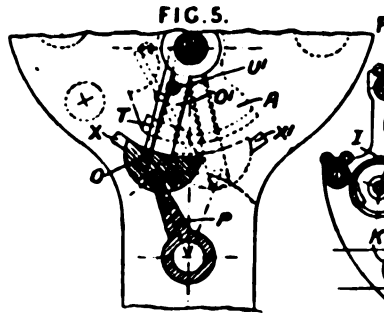
New Inventions

Intaglio and Offset Printing.

A machine for printing in several colours at one impression from a plate having a design in relief or intaglio, or from a rubber offset surface comprises a rotary cylinder A to which a brass or zinc printing-plate M¹ is attached, or which may be fitted with a rubber offset surface, and a series of cylinders H fitted with rubber printing surfaces I, and one or more similar cylinders M which are employed for printing additional impressions on the outside of a sheet which is printed on its underside with offset impressions collected by a rubber surface substituted for the plate M¹. The cylinder A is arranged to co-act with an ordinary impression cylinder when printing from a relief surface or from an offset surface M¹, the cylinders H applying inks of different colours in designs to the surface M¹. The sheets are taken from a table L and delivered by a cylinder K. When both sides of the sheet are printed, the sheet is delivered by a cylinder K¹, after receiving an offset design on its underside, and a design in one or more colours from one or more cylinders M on its outside. The sheet is held by grippers N¹¹ to the cylinder A. When printing from a plate engraved in intaglio, the raised parts of the rubber surfaces on the cylinders H are adapted to apply ink directly to the depressed parts of the engraved plates, and the pressure-member in this case takes the form of a

FIG. 5.



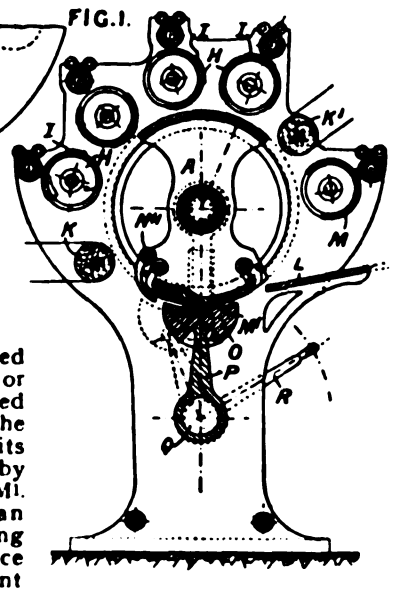


FIG. 1.

counterplate attached to a curved member O supported by a rocking toggle-lever P, and attached to a radially moving slide O¹, Fig. 5. The member O at the commencement of the embossing operation is in the dotted line position, Fig. 5, and clamps on the cylinder A act on clamps on the member O and the members O¹, P force the member O against the plate M¹ and so produce the printing pressure which is maintained until a block O¹ on the cylinder acts on a lever T pivoted to the member O and returns it to the dotted line position. Stops X, X¹ limit the motion of the member O, and by moving the lever P by a handle R about its eccentric pivot Q, the member O may be tripped out of action. The cylinder A is normally driven by uniform gearing, but it is driven by variable gearing arranged to have a slow motion when coacting with the pressure-member O. The rubber surfaces I receive their ink from polished metal, or glass, rollers obtaining ink from plates supplied by gelatine rollers arranged in fountains. The rollers H are adjustable laterally and are mounted in eccentric bearings which are adjustable to enable the cylinders to move nearer to the cylinder A when inking of intaglio surfaces is required. The rubber relief surfaces I used on the rollers H are obtained from a matrix of lead, or the like, obtained by the stereotype or other process. This is covered with sodium silicate, or dextrine solution, dried, and a layer of rubber attached to blotting paper is vulcanised in contact with the matrix. To obtain a cameo printing plate, the brass plate M¹ is printed from the rubber surfaces I, covered with "Palestine bitumen" and the unprotected part of the plate etched. To obtain the intaglio plate, the brass plate is treated with powdered bitumen treated with a solution of lacquer, alcohol, celluloid, and acetone. The design is developed in benzine which acts on the printed portions only, and etching with iron chloride completes the process. The invention is in the name of the Soc. d'Exploitation des Procédés d'Impression Sardou.

Gold Inks
(LETTERPRESS)

IF you have never yet tried Gold (Letterpress) Inks or are familiar only with those hitherto obtainable, Lorilleux and Bolton's gold inks will be a revelation to you.

No modern printer keen on cutting costs and speeding up production can possibly afford to ignore the handiness and economy they offer.

The following points show the great superiority of Lorilleux & Bolton's gold inks:—

1. They do not clog or harden on the rollers.
2. Need no specially skilled operator.
3. Are suitable for either platen or cylinder machines.
4. The machines can be run at normal speed.
5. Retain their brilliance for long periods.
6. Print the type thoroughly and heavy solids without difficulty.

Available in light and dark shades of gold as well as silver.

Write for specimen prints and generous sample tin to-day.

A Printer and His Own Advertising.

By W. H. SESSIONS, of the Ebor Press, York.

Advertising is undoubtedly one of the most difficult problems in business, but I think it is more difficult in printing than in other trades. The main reason for this is that printing is a curious mixture of manufacturing and craftsmanship.

Perhaps I can illustrate what I mean by referring to chairs. In the old days a customer went in and ordered a chair to be made for him; and beautiful, well-made chairs those old craftsmen of Chippendale's time made. Nowadays, chairs are very largely factory-produced articles. The selling problem of the chair-maker has changed. The advertiser under Chippendale's conditions would say that he made good chairs, invite enquiries and would show a customer chairs he had made for somebody else, which could be adapted to suit this customer's needs. Advertising a chair nowadays is showing an illustration of the factory-made article, saying all that can be said about it and then securing sales in fair quantities of the one standardised factory-made article.

Advertising printing to-day is very like what advertising chairs would have been in Chippendale's time, but—and here is an important difference—once the order is given, it is produced very largely under factory conditions, and this, the root difficulty of selling in the printing trade, must always be borne in mind. We are taking the individual orders of the old craftsman and executing them under modern factory conditions, and, like oil and water, the two are rather difficult to mix together into a sound selling policy, and the task presents a very different problem from that of the chair or soap manufacturer of to-day.

Another difficulty in the printing trade is that there are many qualities, but no brand of quality, and it is not easy for the average customer to tell what he is getting by way of the extra quality put into printing. I have been building a house and putting in some oak. Oak is more expensive than deal. Why? Because oak takes longer to grow. Now quality printing takes longer to "grow," and so costs more than poorer. But whereas I, with only an ordinary man's knowledge of woods, can tell at once the difference between oak and deal, the ordinary man finds it much more difficult to tell the difference between good and only fair printing, even although the good may have taken 25 per cent. longer to "grow" than the only fair.

I mention these points in starting because they are obvious difficulties in connection with advertising printing. It is not possible to assume that methods of advertising which are good for other trades will be equally good for printing; they may be, but they want examining first in the light of the peculiar selling difficulties of the printing trade. To turn to advertising in itself, advertising is not just an extra item of business expenditure, not just a department of business activity, but it is so interwoven, so interlocked with the health of the business itself that it must be considered in the closest relation to all the various activities of the business. It should be remembered that although advertising is put down in the business accounts as an expense, its results are more akin to those of an investment. Because of this the most important point to remember in advertising is that it should be entered into on a definite plan. Poor and crude advertising worked on a definite plan has a far, far better chance to succeed than the most brilliant worked by fits and starts.

Advertisement planning falls under seven main heads, involving a close and detailed investigation covering the whole activities of the business. These seven heads are: 1, What to sell; 2, To whom to sell; 3, What the customer really wants to buy; 4, The amount to spend; 5, The methods to use; 6, What to say; 7, How to back up the advertising. Because the investigation is so intensive it is helpful to put down on paper the conclusions reached under the different headings.

What to Sell.

The answer, at first sight, is printing; but even this simple answer raises problems, for few printers could advertise every form of printing they do. We shall have to specialise in our advertising. This will be beneficial, for I am profoundly convinced that one of the troubles of the printing trade is a lack of specialisation. "Printers of Everything" is the advertising slogan, and too many of us try to live up to it. If I ventured to prophecy, it would be that the future will show in England, what is already happening in America, that the general printer will tend more and more to be confined to the small places where a general printer is needed, just as in the small villages the shop has to sell everything; while in the larger places, where several printers exist, they will tend to specialise more and more.

Block by courtesy of "Business Organisation and Management."

Mr. W. H. Sessions.

Look at the advantage! On the one hand we have four printers in a district each with poster plant a quarter employed; four printers cutting poster prices in a vain endeavour to increase the use of the plant; four printers each with a quad crown machine three-quarters of its time on demy work or less; four printers with a battery of platens often idle; four printers with a bindery full of natty little machinery, used one day a week on an average; four printers damning bad trade and cursing each other's competition. On the other hand, why not this? One poster printer, plant busy; one catalogue printer, busy; one bindery, going hard; one printer up to demy folio going strong; four printers busy, four printers helping each other with their own special facilities, four printers whose main competition now lies only between their wives in the matter of hats.

Specialisation need not depend upon the size of the plant. I have sometimes said that if I had to start printing over again, even if I had only £100 in my pocket, I would still specialise. In these days £100 would not go far, and you might say, How could you specialise with the second-hand platen and the very small amount of type and equipment which could be purchased for £100? Quite seriously, in such an event I would be the best card printer in the district, and I should stick at printing business cards and push business cards—and nothing else—until I had satisfied myself that I had practically cleaned up the district in business cards; then if funds would allow, I should start advertising business cards outside the district. In regard to specialisation, a consideration of the advertising of competitors is useful, not to follow or to fight them, but rather to avoid them by striking out in a different direction which they are neglecting. This suggestion of specialisation in advertising has one important aspect for the printer. General advertising will produce general enquiries, which may or may not suit the plant, and an enquirer who has orders to place, some of which will be exactly suitable for the plant, may be choked off because the first quotation asked for was not suitable, and so the printer could show him no benefit, possibly the reverse. It is therefore wise in advertising to so word it that it will produce enquiries which will be suitable for the plant.

Utilising Idle Resources.

Whilst on the subject of the plant, from what I know of my own business and from what Mr. Forman told us at the Federation annual meeting this year, one of the difficulties of the printing trade is that, taken in regard to other trades, more plant is needed in proportion to turnover, and there is a relatively high percentage of plant idle at any one time in the printing office. Our costing system throws a spot light on the actual use of machinery, and will teach us much about what we ought to advertise. This difficulty is partly due to our lack of specialisation and our attempts to "print everything," so advertising will not bring a complete solution of this problem, but the position can be improved by advertising deliberately planned to bring into use half-idle plant. After all, unless there is a special opportunity to be seized, what is the use of advertising in a way which will mean further purchase of machinery? If you have machinery half idle, the one will mean laying out money, whilst the other will mean utilising the money lying dead in the factory.

Then there is the problem, a serious one in the printing trade, of seasonal slackness. The printing trade is too much in a position of hanging on in certain periods of the year, and having to cope with a rush of overtime at others. A printer's advertising should be planned to bring work during the slack time, and not in those periods of the year when orders are too plentiful to get them through properly. Here, again, this is a counsel of perfection, for the problem is by no means easy of filling up those gaps of slack periods, but I would recommend every printer to chart out his busy and slack periods and consider them in relation to his advertising. Here again, as in the case of the half-used plant, such advertising is profitable because there is no need of any increase of capital or plant to meet the extra trade.

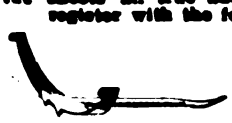
Then there is the point of view of bad trade all over the country. Should you advertise in a slump or not? Is the only remedy cutting prices until there is no profit in the trade?

Speaking from actual experience, I do suggest that the wisest course is to advertise, and put our very best into advertising, when things are quiet. Trade is wanted most of all then, whilst the new connections thus formed, together with the increasing volume of regular trade, will keep the advertiser busy enough without much advertising when trade improves. Whereas cut prices often lead to unprofitable repeat orders in busier times. Look at the cost of overhead charges running on in times of bad trade. Surely it is better to spend money in advertising than in dead overhead charges—better for the present, much better for the future of the business, and very much better indeed for the workers.

What should be the Advertising Policy for Bad Times.

Such advertising perhaps should not be quite the same as in more prosperous times. The printer has to live more on his wits in bad times. This is a term more usually employed of the sharper and the cheat, but it is advisable to put forward all the ingenuity and brain power possible in honest

Lecture delivered before the Association of Master Printers of W. and N.W. London on Monday of last week.



This lecture was based in part upon an article by Mr. Sessions which appeared in "Business Organisation and Management" (Sir Isaac Pitman & Sons, Ltd.).

business when there is a period of bad trade. Look to the possibilities of new openings for printing, for this may bring advertising clear of competition—a point of especial importance at a time when competition for the diminished volume of printing reduces business to the ruthless, selfish law of the jungle. It is indeed well, where possible, to get outside competition, to get beyond the advertising which is merely going for the other man's customer. Competition has to be met, and it is well for the general efficiency of business that there is competition. At the same time, there is much to be said for the firm who in times of bad trade strives in advertising printing to make two blades of grass grow where one grew before, rather than struggle for the blade of grass already there.

It is not everybody who has the good fortune to stumble across, or think out, some new or some distinctly improved use of printing, but even here there may be possibilities hidden away amongst the orders coming into one's own printing office, if the use of all we print was sufficiently enquired into. It is the experience of every business that there are some people or trades who use more printing than others. If all the customers used as much printing in proportion as these, the printer's trade would be greatly increased, and this without taking away customers from competitors. From an ethical standpoint, this is the finest sort of advertising, and it is also the finest sort of advertising from the profit standpoint too. Therefore, go carefully into the possible uses of printing in planning advertising.

These suggestions show that the problem of "what to sell" requires the careful and skilled attention of every printer; and the advertising will be all the more fruitful and effective if the various aims and purposes it is to serve have been carefully thought out.

To Whom to Sell.

It is impossible to suggest much with regard to customers, as almost every business man and society is a user of printing, but I would suggest to those of my audience who think anything of my remarks about specialisation, that they should devote their advertising to those groups of customers who are the most natural users of the printing upon which they have decided to specialise. Every printer ought to go some night to his printing works, and with his pipe and a note pad take it room by room, turning on all the lights and sitting where he can see everything, spend an hour in each room, thinking hard as he smokes his pipe of the possible use of the plant he sees in front of him, thinking hard about the plant which is only little used, thinking what people already use that plant, and why other customers don't, if they ought to and how he can get them to. After he has thought hard in each room, and made his notes, let him look through his orders for a year or two back, then, but not till then, to consider his advertising problem, and I think it will be clearer to him because of his night's musings.

There is another point worthy of attention by the printer. Augustine Birrell, discussing direct and indirect taxation, summed it up in his pithy way thus: "To secure his money the Chancellor of the Exchequer must tax the wealthy because they have so much and must tax the poor because they are so many." One's printing can often be improved to appeal to the fewer wealthy firms or be cheapened to appeal to the mass, and it may be helpful to remember this "Birrellism" when planning the details of a printing publicity campaign. Advertising does give the means of selecting our customers, and full advantage should be taken of this fact.

What the Customer Really Wants to Buy.

This seems easy, but it is really a difficult problem, and one which is often overlooked in business, in spite of its being of such importance. One of the best days' work I ever did in my life was when I realised that my customers did not want printing. From the time I realised that my printing was not wanted, I began to sell more. That may appear strange, so let me explain. A trader gives me an order for, say, account forms. What does he really want? A means of getting in his money. If a tin of treacle would get the money in better, never an account form would be buy. He gives me an order for some advertising booklets. What does he really want? Not the booklets, but an increase in sales. I may think I am selling account forms and booklets, in reality I am selling a means of getting in money and a means of increasing sales, and should therefore look at my work from that angle and not as mere production of printing.

This point in advertising is nowhere better illustrated than in gas and electricity advertising. No one wants gas, as such, a vile-smelling, poisonous thing. No one wants electricity as such, a mysterious thing that gives us shocks. What is wanted is the light, the warmth, the cooking of food, the driving of machinery. Hence it comes about that, although the supply companies are selling gas and electricity, they never talk much about the thing they sell, but they talk in their advertising about what is really bought. "Radiant heat," "Turning night into day," are their slogans.

We must get the customer's point of view, for this is not only a great help in planning advertising, but it is a great help in the general business as well. If what the customer is really wanting to buy is kept in mind, all the time, a finer perception is gained of his wants; his requirements are better met, and more attention is paid to his real needs. So the little acts of smartness and service, which add appreciably to the goodwill and trade of any business, will be more highly developed and custom will be more permanent, for such careful study of actual needs is appreciated. It smartens up the whole outlook of the master printer, of his staff, and of his firm's policy.

The Amount to Spend.

Because it has a definite aim, advertising must therefore be worked on a definite plan and not be haphazard expenditure. Now it is not possible to plan without knowing how much is to be spent, and financial details will need considering here. A firm which has just extended its business will have to spend more than one who only has a few gaps to fill up, and no printer starting out in business, extending, or even buying more machinery, should neglect to put aside some of his capital for advertising expenditure. One with little spare capital or machinery lying idle will not want to spend so much as where there is such a reserve. Most important, too, is the question what saving will be effected by increased sales. For example, if 25 per cent. increased sales will mean but little increase in overhead charges, more can be spent on advertising, because the cost will be paid by the saving in these overhead charges. Then, too, the point of possible savings through improved and mass production should also be considered. You may smile at my suggesting mass production in regard to printing, with its individual orders, but specialisation and advertising may open up possibilities even here for the printer.

It is rather difficult to say how much should be spent by a printer on advertising, because it is obvious that it cannot be considered quite by the amount of turnover. A printer doing a large amount of corporation, railway, newspaper, magazine or other contract work, which is only secured by tendering at a low figure, can hardly consider such turnover in relation to his advertising expenditure, but I would suggest that wherever a printer sees satisfactory openings for greater use of his printing he should spend at least 5 per cent. of his turnover in advertising, and no printer, however situated, should spend less than 2 per cent. By that I mean including the cost of any printing he does himself for his own advertising in this percentage. In times of special depression in trade a printer may even increase this 5 per cent. and still find it profitable, because good advertising is cheaper than dead overhead expenses. It may be helpful to say here that I am speaking from personal experience. Only this year I spent 6½ per cent., and my auditor drew my special attention to the large amount being spent on advertising. I agreed that it was pretty stiff, but I asked him what he thought of the results for the year, he said that they were highly satisfactory under present conditions. I suggested connecting the two together. He considered this, then remarked that if I thought that the satisfactory results were produced by the advertising he had nothing more to say.

It is wise not to plan out the whole of the amount decided upon for advertising, but to leave some for "stunts" to meet a special opportunity. The district, for example, may have its spending power suddenly increased by special work, such as the recent battleship orders to the Tyne and Mersey, a Budget change may take place, or some other event bring a special opportunity for a successful increase in advertising in certain directions.

The Methods to Use.

This part of the problem should be considered in the light of the conclusions already reached. "Keeping at it" tells better in advertising than making a big splash, with a long interval before the next, for the effect of the previous advertising must not be allowed to wear off. In planning times of advertising it should be remembered that where the desire to buy has to be created, advertising must be well on the way before the time to buy arrives. This is a point which the printer has specially to remember. To take the example of furs, if a printer had an idea of something for this trade he must advertise it to the fur retailer in the summer, whereas if the idea was something for the fur manufacturer he would have to get busy about it in the spring.

Now as to the merits of any method; in the main it is well for a printer to "take his own ginger," and if a printer has a newspaper he can devote some of his advertising to columns in that newspaper, but I would suggest that this be not just the usual stock fill up, but that he should look at his own advertising as though he were doing it at the rates charged to his customers and that at least one advertisement every week should be a fresh one in his best style.

Most printers have no newspaper attached, but many do posters. It does seem to me that more may be done in the way of poster advertising by printers. Have you ever considered that the hoardings are filled with the productions of the printer, and yet how rarely you see a printer's own poster? To the best of my recollections I have seen six, almost all in quite small towns. Looking at your hoardings in London now, I only see one printer's poster, and I cannot remember any poster by Hassell or any of our leading artists which has been got out on behalf of a poster printer. How can we convince our customers of the merits of poster advertising if we neglect it ourselves?

(To be Concluded.)

13 IS THIRTEEN AN UNLUCKY NUMBER ? WE SAY *NO* 13

? CURIOSITY ?

is a human failing. It is also a commercial asset. Curiosity is, in fact, one of the secrets of modern commercial success. It keeps you in touch with every modern development of the trade in which you are engaged.

It is a commonplace to say that the printing trade covers a range of activities greater than most.

Obviously, therefore, you haven't the time personally to gather the information to keep thoroughly in touch. This is done for you by the *British and Colonial Printer and Stationer.*

You probably have many friends in the trade, however, who are not keeping in touch.

CO-OPERATION

You can help your friends and us by introducing to them the *British and Colonial Printer and Stationer.*

Let us have their names and addresses : we will do the rest.

THE

British & Colonial Printer & Stationer

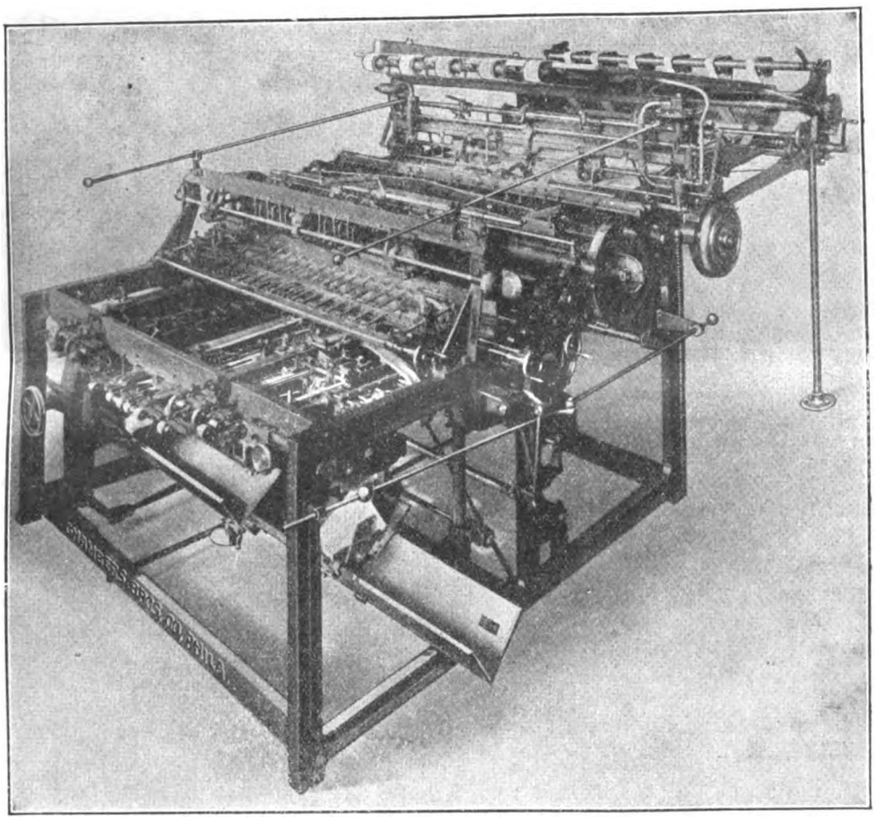
has been established for nearly 50 years. The more important features are :

Reports of Trade Associations, Societies, etc.,
Latest Commercial Intelligence
Technical Articles
Trade Notes
etc., etc.

A monthly issue contains a section devoted to the **Bookbinder** with notes and news and market prices.

The monthly **Lithographic** issue contains special litho matter including litho notes and news.

The **Quarterly Export** issue deals with colonial and foreign markets and provides a general review of the home trade.



COST

The yearly subscription to the *British and Colonial Printer and Stationer* is **Thirteen Shillings** including postage. Is it not worth it?

Send us your friends' names and addresses **To-Day**.

LOVE'S PAPER RECOVERY MACHINE.

Patented (No. 144485) by Joseph Love.

THIS Machine has been invented for the purpose of speedily recovering the small quantities of paper left on centres or spools which are thrown out from Printing Machines, etc. (commonly known as "Reel Ends"), so that it may be cut into suitable sizes by the Guillotine.

CHIEF ADVANTAGES:

1.—No spindles, bars, or cones are required, the reels being kept in position by a patent spring device thus saving time and labour in loading and unloading.
2.—It occupies a space of only six feet on the run, and is quite noiseless.
3.—The power required is such a small amount that it can be driven from any existing shafting.
4.—Centres of any kind or width can be worked on the machine
5.—It can be run at the high speed of 500 feet per minute, and will recover approximately 3 tons of paper per day.
6.—It can be constructed to suit all requirements in the off-cut trade, and is equally valuable to Printers or in Paper Mills.

Printing Trade Organisation.

Mr. R. A. Austen-Leigh Addresses Very Successful L.M.P.A. Rally.

The United District Rally of the Master Printers of the South-East, South-West and Thames Valley of the London Master Printers' Association, held at Johnston's Restaurant, Wimbledon, on Tuesday of last week, was a highly successful gathering, and there was a general expression of opinion that it should be the first of a series of such gatherings. Mr. E. G. Cole, president of the South-West L.M.P.A., presided, and amongst others present were: Messrs. R. A. Austen-Leigh, C. Arthur Bates, G. Poulton (president, S.-E. L.M.P.A.), R. B. Simnett (vice-president of the S.-W. L.M.P.A.), J. Brigenshaw, E. Trim, A. Spring, T. J. S. Guilford (secretary, Thames Valley), J. A. Drewett, H. R. Grubb, W. Whyte (secretary, London Master Printers' Association), F. H. Cole (secretary, S.-W. L.M.P.A.), and J. Johnson (L.M.P.A. organiser).

In his opening remarks the chairman welcomed those present, and read letters of apology for non-attendance from Messrs. John D. Wise, F. W. Cheyney, Alderman Simpson, and Mr. A. V. Colleypriest (president of the Thames Valley L.M.P.A.). He also intimated that Mr. W. J. Boyle (joint secretary of the Central District) was seriously ill, and it was unanimously agreed that a letter of sympathy should be sent to Mr. Boyle.

Mr. J. A. Drewett, on behalf of Mr. Colleypriest, extended a welcome to the members present that day. There were not as many members of the Thames Valley District present as he would like to see, but they had to remember that the Thames Valley was a small and scattered district. The speaker remarked on the value of such gatherings.

Mr. G. Poulton (president of the South-East L.M.P.A.) welcomed the members on behalf of his district and also stressed the value of such gatherings.

Organisational History.

The chairman then called upon Mr. Austen-Leigh to address the meeting upon "The Organisation of the Federation of Master Printers and the London Master Printers' Association."

Mr. Austen-Leigh expressed very great pleasure at being present and wished them every success in the organisation of such gatherings. No one would be tempted to deny the importance of his subject, but before they examined the problems of to-day they should look back to the history of organisation in their trade. In the earliest times, most of the organisation was in the hands of the State, which was very much afraid of the dissemination of any literature of which it did not approve. Having to work through some body, it selected the Stationers' Company to see that nothing objectionable was published.

A Restrictive Ordinance.

Nearly 300 years ago—actually in 1637—the famous Star Chamber decree was passed limiting the number of London master printers to 20, and only allowing two in the country, viz, one at Oxford and the other at Cambridge. The effect of this upon the character of English printing was most lamentable. Faced by little or no competition, printers took no trouble with their work, anything was good enough—with the result that during the 17th century the standard of our printing was of the poorest kind. These regulations were continued with very short lapses until 1693. It was doubtful, however, whether the regulations were very completely put into force, or that there were ever quite so few as 20 master printers. But it might be accepted that in 1693, outside London there was only one printer at York, and one at each of the Universities.

Upon the withdrawal of the restriction printing took a great leap forward. Presses were, in the course of a few years, started in such important towns as Bristol, Norwich, Exeter, Worcester, Canterbury, Newcastle, etc. Early in the 18th century local newspapers began to appear. More important still, from the printing trade point of view, the despotic rule of the Stationers' Company came to an end.

Collective Action.

Joint action between either masters or men did not begin, so far as he was aware, until 1785. In 1785 the journeymen compositors of London submitted a proposition to the masters with a view to advancing the price of labour. It was interesting to note that the compositors were not allowed to be present when the proposals were discussed, and also that one of the requests was for an increase to newspaper hands, who were even then being paid upon quite a different basis from the book trades. They were getting 27s. a week; piece hands in book houses, 4d. per thousand; 'stab wage in book houses, from 21s. to 27s. The master printers granted five proposals out of the total of eight. In 1794 the pressmen's rates were regulated by master printers.

Limitation of Apprentices.

In 1798 five pressmen were indicted for conspiracy to prevent masters from taking as many apprentices as they were legally entitled to; it was contended that the men had framed a rule to limit the apprentices, had sent notices to divers journeymen to leave their work if the masters did not comply with the rule, and that they had generally conspired to injure the masters' trade. Apparently there was nothing in those days to stop a master taking as many apprentices as he liked. Trouble broke out at a particular office. The masters invited five pressmen who acted as leaders to meet them, but refused their demand for a limit of three apprentices to seven presses, and would only give a rather vague assurance that they would not overstock the trade with apprentices, provided that the men absolutely abandoned the idea of opposing the masters in doing what they thought proper. Although the masters and men failed to come to an agreement, it is stated that they separated amicably.

Severe Measures Taken.

Unfortunately fresh differences arose, and there was a likelihood of an organised strike. The masters promptly replied by issuing warrants against 18 pressmen. Five of these were eventually indicted on a charge of conspiracy. When their counsel raised the point of the reasonableness of the request for a limitation of apprentices, the Court at once ruled it out of order, and said that the question which arose was, was it a conspiracy? The Recorder summed up strongly against the defendants, who were all found guilty. Sentence was, however, deferred, in order to give the men a chance of apologising and expressing contrition. Had they done this the matter would have been at an end. This, however, they valiantly refused to do, and accordingly were sentenced to two years' imprisonment in Newgate. This was an illustration of how much masters had matters in their own hands a hundred or more years ago.

Genesis of Masters' Association.

The masters of London and Westminster in those days had some sort of organisation which gradually came to an end when matters settled down in the first quarter of the last century. A new association came into being in 1836, when we read that the provisional committee had the advantage of the experience and knowledge of two members of the old committee of the master printers, and that they had endeavoured, allowing for the altered circumstances of the times, to frame their rules after the mode of the old society. As reconstituted, the Association lasted until 1870. It might be interesting to narrate that in 1841 the financial position was so satisfactory that it was deemed unnecessary to raise

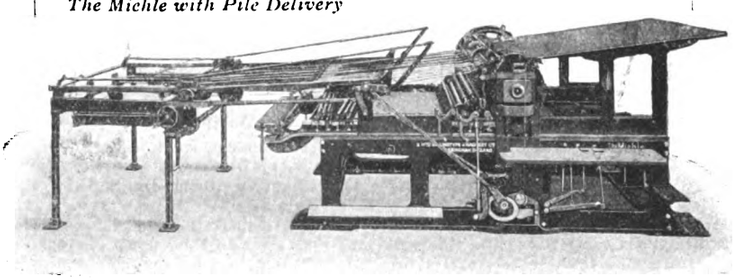
FINE PRINTING

Go into any printing works noted for good quality printing and you will see Miehle presses.

In some of these printing works you will see ***only*** Miehle presses. Why?

All these printers cannot have made a mistake when equipping their works with Miehles.

Nor would the all-Miehle houses and others who have added to their Miehle installations have repeated their orders if the original orders had proved to be blunders.



The Miehle has received, and continues to receive, the best backing by discerning printers. They will tell you why.

We are the manufacturers of this famous two-revolution press. It is built in six sizes, from double demy to ex. eight crown. May we send you full details?

LINOTYPE & MACHINERY LTD.
9 Kingsway, London

Members of the Association of British Manufacturers of Machinery for the Printing and Allied Trades

The Miehle with Pile Delivery

any subscription for that year. In 1840 an annual dinner was established. Three years later, however, the dinner was confessed a failure.

In 1847 there were meetings of the compositors to clear up the disputes concerned with the scale of 1810. From July 9th to November 4th 17 sittings in all were held, the bill for refreshments for the men being £60 19s. In 1855 the annual subscription was fixed at £1 1s. and during the years 1857 to 1870 meetings were held at Freemasons' Tavern. In 1870 it was stated that the relations with the L.S.C. were unsatisfactory, but it was nevertheless resolved to wind up the Association on October 12th of that year.

The Federation's Beginnings.

In 1890 the Master Printers' Association was restarted. During the '90's associations sprang up in various parts of the country, and the question soon arose as to whether there could not be some sort of united action between them all. In the year 1901, largely owing to the efforts of the late Mr. Walter Hazell and Mr. R. J. Lake, the Federation was formed. At first the Federation had practically no officers of its own, and most of the matters common to the whole country were left to London to settle. The Federation, however, gradually grew in importance and eventually was reconstituted under General Bemrose's scheme, by which the country was divided into twelve alliances.

Mr. Austen-Leigh went on to refer to the operation of the block vote and to wage questions of much interest to master printers. He concluded by referring to the recent strike of pressmen in New York, and pointed out the lesson to be learned from that dispute.

Mr. Spring said it was a great pleasure to listen to Mr. Austen-Leigh, who always gave them something to take away. In regard to the wage questions touched on by Mr. Austen-Leigh, it was his opinion that the machine compositors were causing all the trouble, and he did not agree that the mechanical men should be paid higher wages than a hand compositor.

Mr. Young further complimented Mr. Austen-Leigh, and referred to his extraordinary abilities in undertaking negotiations. They had been fortunate in having a man like Colonel Truscott to succeed him and to take the mantle of Mr. Austen-Leigh upon his shoulders. Referring to the recent strike of New York pressmen, the speaker said that the dispute was absolutely a local one, and that the trade union parent association had refused to negotiate on behalf of the strikers. It was, in short, the dock strike all over again.

Mr. Whyte said that before leaving the office he had had an argument with a Scotsman, who contended that he had overpaid his subscriptions to the L.M.P.A. He, as a Scotsman, denied the possibility of that happening. If a Scotsman unwittingly overpaid his subscription, it was evidence of the enthusiasm created by the good work done by the Association.

Mr. C. A. Bates.

Mr. C. A. Bates then addressed the meeting upon "Some Impressions of My American Visit," and described his experiences in New York, Atlantic City, St. Louis and Chicago. He stressed the fact that the advertising man in America was a person of some considerable importance, but they over here should get away from the practice of merely selling paper and ink and should graft some of the advertising business on to their own.

Mr. Simnett, proposing a vote of thanks to the speakers, spoke of the pleasure that they had all derived from both addresses, and emphasised the necessity of printers acting as advisers to their customers.

Mr. Brigenshaw seconded, and cordially agreed with Mr. Simnett.

Mr. Trim supported, and Mr. Austen-Leigh and Mr. Bates briefly responded.

Paper Mill Wages.

Revision of Agreement No. 3.

The negotiations between the Employers' Federation of Papermakers and the representatives of the unions in Manchester were amicably conducted, and the revision of the No. 3 Agreement was concluded.

A spirit of compromise prevailed. Accordingly there is no change in hours, which remain at 132 (44 hours per week). As to the number of extra hours which might be worked by agreement these were fixed at four.

The question of special conditions as to hours on slow running machines was considered, and this matter was left to the District Boards as provided for in the existing Agreement.

No alteration was made in piece-work rates, but in regard to overtime rates, where employees elect, with the consent of the management, to do work other than paper-making on Sunday, which under normal circumstances of working would be done on Saturday, it was agreed that time and a half only should be paid.

Juvenile rates of wages were slightly lowered for the ages 16 to 19, while the rates for ages 20 to 21 were increased by ½d. per hour.

Mr. C. R. Seddon presided over the deliberations, with Mr. G. Harroway (president of the National Union of Printing, Bookbinding and Paper Workers) leading for the unions.

THE Lloyd Memorial (Caxton) Seaside HOME.

The Late Mr. Douglas J. Gant.

At the committee meeting on Saturday last an impressive ceremony took place in honouring the memory of Douglas J. Gant, who for over 30 years was an active worker and the first secretary of the Deal Home.

The chairman (Mr. W. Trobe McMullon), in welcoming Mr. J. Gant (son of the above-named) said that Douglas J. Gant was a widely known and highly respected man in the printing trades, whose sterling and upright character was much appreciated on every hand. He felt, however, that the honour of officiating on the present occasion belonged to the late chairman of the Home who had also been a life-long friend of Mr. Gant. He therefore would ask Mr. T. A. Newnham to address those present.

Mr. T. A. Newnham, on rising, was visibly affected by having been called upon to speak so suddenly of a friend he held in so much esteem. Mr. Newnham said that the large gathering were assembled to do honour to the memory of one of the finest men who had ever worked at the trade. To himself the memory of Douglas J. Gant would be cherished with affection and respect. He joined the committee with Douglas J. Gant over 30 years ago, and during the whole of that long period he proved him to be courtly and gentlemanly alike as a friend and as secretary of their Fund. His pioneer work resulted in the splendid institution they possessed to-day, and therefore his friends on the committee of the Home decided that they would endeavour to express the high appreciation of his services by presenting to the family a framed tribute of indebtedness to their late comrade. Words failed to express his thoughts adequately, and he asked Mr. J. Gant to be kind enough to explain to his mother and the family that fact. The tribute was intended to express in some slight degree the feelings of sympathy they felt for the family also the respect they all had for their late comrade and friend, as also to voice the sentiments of the wider circle of friends who would never cease to honour the name of Douglas J. Gant. They were also hanging an enlarged photo of their late friend in the dining hall at the Home.

Mr. J. Gant, in accepting the framed tribute, said he appreciated all that had been said of his father, and he was sure that his mother and the whole of the family would treasure and keep this memento as long as they lived. He appealed for the committee's votes and support for his mother, who, he said, would be a candidate next March for a pension from the Printers' Pension Corporation.

Lloyd Memorial Home.

Peace Memorial Wing.

On Saturday, December 1st, Lady Violet Astor, accompanied by the Major the Hon. J. J. Astor, M.P., and body of influential gentlemen and ladies, will visit Deal to lay the foundation stone to the Peace Memorial Wing dedicated to the officers and men from the printing and allied trades who fell in the Great War. The Bishop of Dover has kindly consented to officiate, and it is anticipated that the Mayor of Deal and members of the Town Council will be present. A handsome souvenir programme is being prepared for the occasion.

Day tickets priced at 10s. 3d. can be obtained from the secretary, Mr. H. F. Parker, 80, Blackfriars road, from whom full particulars can be obtained.

The committee also announce that their annual matinee will be held at the Kingsway Hall on December 8th, when, as usual, the talent will be exceptionally fine.

A USEFUL Engineering Directory is published by *Engineering*, Ltd, 35-36, Bedford-street, Strand, London. It is compiled and classified from the advertisements appearing in the weekly journal, and includes glossaries for the use of foreign buyers.

Printing, Bookbinding & Kindred TRADES OVERSEERS' ASSOCIATION.

Members' Annual Re-union Smoker.

There was a large gathering of the members of the above Association on Tuesday of last week at the Talbot Restaurant, London-wall, E.C., the occasion being the members' annual re-union smoking concert. This event stands alone among the varied functions held by the Association during the year. Apart from the fact that its main purpose is to mark the commencement of the winter's programme, it also presents a splendid opportunity for the members to be drawn closer together, enabling them to obtain a better knowledge of one another. The gathering was held under the chairmanship of Mr. H. Milton (president), supported by Mr. J. Fleming (vice-president), and in every way proved to be a complete success. Mr. A. Jones, who had charge of the musical arrangements, succeeded in securing a capital programme, his efforts in this direction being greatly appreciated.

Election of New Members.

Before giving full attention to the principal attractions of the evening some brief association business was transacted. Among the items dealt with was the election of the following new members: Mr. J. T. Brooks—overseer (warehouse department), Amalgamated Press, Lavington-street; Mr. E. G. Millington—overseer (binding department), Messrs. Porteous, Ltd.

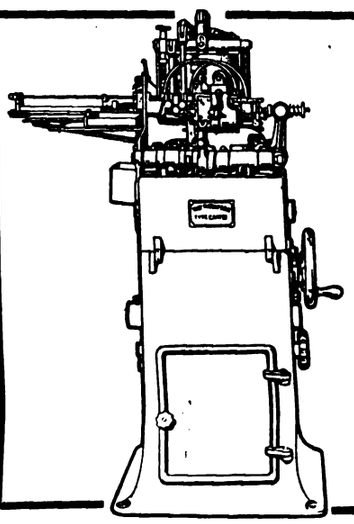
The feeling of the meeting having been heartily expressed in favour of the election of the two candidates, the chairman formally but warmly welcomed the two gentlemen into the ranks of the Association.

Both Mr. Brooks and Mr. Millington returned thanks for the honour conferred upon them.

Mr. Brooks, in the course of his reply, said his proposer, Mr. J. Dixon, had asked him to apologise for his absence from the meeting, as he had been kept away through the death of a near and dear relative.

The Concert.

From the commencement of the concert up to its close the musical talent provided was well sustained throughout. Of the lady artistes the songs of Miss Rose Lacey ("Barcarolle" and "Homeland"), Miss Gladys Fox ("They All Put the Blame on Me" and "Mabel's Pigtail"), Miss Daisy Stupples ("Why Am I Always the Bridesmaid?") were excellently rendered, and brought forth very marked approval. The solos of Mr. Adrian Kennedy ("Floral Dance" and "For You Alone"), Mr. A. Jones ("Songs of Araby" and "Fairings"), and Mr. W. Archer, jun. ("English Rose"), were most warmly received, while the vocal duets by Messrs. W. H. Edbrooke and A. Griffiths ("The Battle Eve" and "Excelsior") met with an equally good response. Mr. J. A. Esler again delighted his audience with some clever card tricks. Mr. Jack Wells ("Bendy's Sermon" and "Ghungadin") presented some first-rate monologues, quickly establishing a reputation as a reciter of no mean order. The humorous side of the programme was well represented by Messrs. F. E. T. Fox, Walter Todd, W. Goody, and Victor Edbrooke, jun. Mr. Fred Holland (accompanist) capably met all the demands made upon his skill.



At the conclusion of the concert Mr. J. Fleming referred with gratitude to the work Mr. Jones and the artistes had displayed in providing such a capital evening's entertainment. Mr. Jones had done what he (Mr. Fleming) thought was the duty of every member of the Association, namely, the putting forth of efforts that would conduce to their progress and usefulness.

Mr. Jones, in reply, on behalf of the artistes and himself, expressed thanks for the kind words spoken and the appreciation that had been shown to their efforts.

The National Anthem brought to a close a most enjoyable evening.

MESSRS. OLIVE AND PARTINGTON, LTD., have changed their Leeds office from Pearl Chambers to 19, Greek-street, East Parade, Leeds. Here they will resume stocking their various mills' leading qualities, a practice interrupted by the war.

THE

THOMPSON TYPE, LEAD & RULE CASTER

Reliability of a typecaster consists of the high quality of its product at a cost low enough to make non-distribution economical.

Thompson quality is a standard of accuracy not surpassed even by typefounders.

Simple, complete and compact, using Linotype, Intertype and its own matrices interchangeably, the Thompson produces more type than any other typecaster on the market and equals the out-put of two of some other makes.

Type in all languages from 5 to 48 point, leads, slugs and rule 2 to 12 point, accurate in every detail, are produced on the Thompson Type, Lead and Rule Caster.

Trade Notes.

The Home Counties Master Printers' Alliance is to discuss the vital subject of "Variations in Estimating" at a conference to be held at the Abbey Institute, Romeland Hill, St. Albans on Tuesday, October 23rd. The president of the Alliance, Mr. S. F. Oxley, will be in the chair, and will be supported by Mr. James MacLehose, LL.D (past president of the Federation of Master Printers), and Mr. Wm. H. Sessions, of the Ebor Press, York.

The Midland Alliance of the Federation of Master Printers is arranging a week end gathering at the Longmynd Hotel, Church Stretton, Shropshire, from Saturday, October 27th, to Monday, the 29th. The locality is a delightful one, and it is hoped to have some distinguished Federation visitors, whilst the sub-committee is working out a programme elastic enough to please the most varied tastes, including golf, charabanc drives, walks, concerts, dancing and whist.

North London M.P.A.—What was described by one of the speakers as the best meeting ever held by this association took place on Tuesday evening The meeting, which was held in the Church Parlour of the Finsbury-park Congregational Church, Seven Sister's-road, was presided over by Mr. L. F. Hunt (president). Interesting addresses on different matters touching the welfare of master printers were given by Mr. Percy D. Michael (secretary, Home Counties Alliance), Mr. Alfred Langley (vice-president, L.M.P.A.), Mr. John D. Wise (South-West L.M.P.A.), and Mr. A. Williamson (secretary, Federation Costing Committee). Others present were Mr. W. Whyte, (secretary, L.M.P.A.), and Mr. L. J. Cumner. Mr. George Eaton Hart wired regretting his absence from the meeting. A fuller report will appear in next week's issue.

J.I.C. Development. — In furtherance of plans for the development and decentralisation of the Joint Industrial Council by the formation of District Committees throughout the country, an important forward step has been taken in Lancashire and Cheshire. In the wide area covered by these two counties eleven different districts have been marked out, a separate District Committee being constituted for each.

War Orphans Fund.—Time is slipping by, and it should not be overlooked, by employers, trade unionists and the trade generally, that the first pay day in November is the date on which flags will be sold in the printing and newspaper shops of the United Kingdom in aid of the Printers' Pension Corporation's War Orphans Fund, which is £14,000 overdrawn. The scheme, to which we have previously drawn attention, is being organised by the Joint Industrial Council of the Printing and Allied Trades, which has sent out an appeal, countersigned by the officials of the Federation of Master Printers, the London Newspaper Proprietors' Association, the Newspaper Society, and the Printing and Kindred Trades Federation of Trades Unions. No charge, we understand, is being made for the flags supplied, but printing offices will be left to raise what they can on them, the proceeds to be sent to Messrs. A. E. Goodwin and A. E. Holmes, joint secretaries of the Joint Industrial Council, 24 Holborn, London, E.C.1, from whom the flags are obtainable.

Electrotypers and Stereotypers Overseers' Meeting.—Owing to Mr. Hall's absence on the Continent he will not, as originally arranged, be able to address the members of the Electrotypers and Stereotypers Managers and Overseers' Association at its meeting on Tuesday, the 16th inst. Mr. A. H. Mundey (Fry's Metal Foundry) has kindly stepped into the breach, and will no doubt introduce to the members a subject worthy of their consideration. A large attendance is hoped for.

"Colour Printing in the Nineteenth Century" was the title of an address given to the Exeter Rotary Club on the 2nd inst., by Mr. H. G. Pedrick, of Weston super-Mare. The speaker said no greater Rotarian ever lived than George Baxter, who gave a life of service to his countrymen. After devoting a great many years to perfecting a colour printing process which was far superior to anything achieved previously, Baxter was eventually reduced to tramping the roads with his prints for sale on his back and ended his career in the bankruptcy court. Recently two of his prints realised £700 in London. Baxter gave the world the first pictures ever published in oil colours and the finest printers in the country had never reached the standard attained by him.

A fine programme has been arranged for the Annual Swimming Gala, in aid of Printing Trade Charities, to be held at Shoreditch Baths on Saturday next.

South London Auxiliary.—The committee of the South London Auxiliary to the Printers' Pension, Almshouse and Orphan Asylum Corporation deserve congratulation for the great success that has attended their efforts during the past season. In the report and balance sheet covering the period 1922-1923 it is shown that the record sum of £651 5s. has been allocated to various trade charities, this amount being distributed as follows: Printers' Pension Corporation, £625; Lloyd Memorial Seaside Home, £10 10s.; Caxton Convalescent Home, £10 10s.; Medical Aid Society, £5 5s. The total amount paid into the Printers' Pension Corporation by the Auxiliary now amounts to £8,750. The opening concert of the season is arranged to be held on Saturday next at the "Horns" Assembly Rooms, Kennington Park, S.E., and is to be an Amalgamated Press Fellow P.'s Night.

Major the Hon. J. J. Astor, M.P., will take the chair at the first meeting of the *Spectator* life members, to whom invitations have been issued for Friday, October 12th, at the Hotel Cecil at 3 o'clock.

The annual dinner of the Newsvendors' Institution is arranged for November 14th, under the presidency of Sir Chas. Wakefield.

A proposal by a Marylebone firm to utilise the pavements in the principal streets for advertising has been rejected by the borough council.

The funeral took place on Monday afternoon of Mr. George Ikin, of 26, Nelson-street, Bury. Mr. Ikin went to Bury about thirty years ago as a hand compositor, and later, with his son, George, started a printing business in Manchester. The works were removed to Bury in 1911. He was one of the first printers to join the Bury branch of the Typographical Society, and retained his membership until commencing business on his own account.

The interesting and educative series of weekly lectures arranged by the Industrial League and Council for the improvement of relations between employers and employed have been recommenced this week at Caxton Hall. "The Making of Wealth" will be dealt with by Sir Ernest J. P. Benn, Bart., on the 24th instant.

The well-known publishing houses, Stanley Paul and Co. and Greening and Co. have been amalgamated and will be known in future as Stanley Paul and Co.

The Ministry of Transport's letter to county councils on the display along arterial roads of unsightly posters is receiving much attention in the Press.

Posters designed by children to advertise a series of children's books, published by Messrs. Humphrey Milford, are shortly to be exhibited at the stations of the Central London "Tube."

The Independent Labour Party has just issued at 2d. a pamphlet, "The Capitalist Press: Who Owns It and Why."

New Zealand has just restored the penny post.

The *Paris Soir*, a new evening newspaper appeared for the first time at the week-end.

The military commander-in-chief in Saxony has suppressed for an indefinite period the entire Communist Press of Saxony.

The publication and distribution of Communist newspapers and literature of all kinds are now prohibited throughout Bavaria under the severest penalties.

A Vienna District Judge has ruled that the existing laws to check profiteering do not apply to newsvendors who demand fancy prices for French or English newspapers, and he acquitted the proprietor of a news stand brought before him by an indignant purchaser, who complained that 7½d. was an excessive price to ask for a copy of *The Times*.

From Messrs. John Haddon and Co., of Salisbury-square, London, we have received a well-produced pamphlet descriptive of the Caxtonette Platen. This very useful crown folio machine is admirably illustrated, both as a whole and in its details, and very full particulars are given of its many points of interest.

Trade Union Matters.

L.S.C. Unemployment and Overtime.—Unemployed members of the London Society of Compositors, according to the *L.T.J.*, numbered 802 in the week ending September 22nd, as compared with 784 in the previous week, 748 in the week ending September 8th, and 775 for that of September 1st. Compared with a year ago the numbers shown as signing the out-of-work books on September 22nd, however, indicate a satisfactory decrease of 368. The total number of hours of overtime worked in the general trade during August amounted to 41,726, while the news department was responsible for 7,604 hours. The number of men working overtime in the first category is given as 4,171, and the latter 1,017.

Journalist and War Pension.—The National Union of Journalists recently took up the case of a member who, as an ex-soldier, applied for a Government pension, following a breakdown in health consequent on war service. On his application being refused, the National Union of Journalists' solicitor took charge of an appeal against the decision. The appeal proved successful, and the member has been granted a pension of £2 per week.

The T.A. and Expelled Members.—A piquant situation has arisen in a printing office at Bradford, where a man in charge of a rotary machine was some time ago expelled from the Typographical Association because of arrears of payments to the Association funds. The matter had been brought before the Bradford Branch Committee, who applied to the Executive Council for permission for the remaining T.A. members in the office to hand in notices with the object of forcing the expelled member to rejoin the Association. It was stated that the firm had been approached, but had declined to interfere in the matter. The Executive Council appointed one of their members to visit the branch and make local inquiries.

T.A. Benefits and Auxiliary Work.—The Executive Council of the Typographical Association have had under consideration an inquiry from the Warwick branch as to whether a member could draw out-of-work benefit while travelling round local villages selling various articles. The Council have now announced that a member must fulfil all obligations of the out of-work rules before becoming eligible for benefits, and that members following another occupation could not sign the unemployment book.

Ewart and Collis, Ltd.—A circular has been issued to the shareholders of Ewart and Collis by the secretary, stating that the provisional contract for sale of the Sunbury Works, etc., referred to at the last meeting of shareholders, has been executed by Mr. Alfred Collis, the purchaser, and the company. With a view to completion being effected at the earliest possible date the purchaser is in the course of completing the financial arrangements of his proposed new company which are necessary before the issue of the debentures to the nominees of Ewart and Collis, Ltd.

Printers' Managers & Overseers' (Parent) Association.

Mr. W. H. Burchell on "Profitable Management."

The visit of Mr. W. H. Burchell, founder and first honorary secretary of the Association, drew a very good attendance of members to the meeting of the Printers' Managers and Overseers' Association held at the "Old Bell," Holborn, on Tuesday of last week. Those present followed closely Mr. Burchell's plain speaking on many practical problems of management, and observed with interest his frank display of the many dockets, forms, etc., used in his own establishment. The president, Mr. S. M. Bateman, was in the chair.

A few matters of routine business were first dealt with.

A new member was elected in the person of Mr. O. Richards (Bryant Carton Co., Ltd., Merton, S.W.19; manager—printing department).

November Whist Drive.

The president then introduced the following recommendation by the Council:—"That a whist drive be held at Slaters' Restaurant, Oxford-street, W., on Tuesday, November 27th next, to celebrate the Thirtieth Anniversary of the Association."

The president, vice-president and general secretary all spoke on this matter, intimating that there was a general feeling that the 30th anniversary should be celebrated in some way, that every endeavour had been made to secure a suitable hall for a Saturday night, but that, in view of advance bookings for dinners, etc., it had been found impossible to get the accommodation they wanted. It had accordingly been decided to make a recommendation in the terms before the meeting. Arrangements would be made to ensure an enjoyable evening for all attending.

Without further discussion the recommendation was adopted unanimously.

Profitable Printing Office Management

The chairman then introduced "Member No. 1," to whose energy and perseverance, he said, the successful founding of the Association was due.

Mr. Burchell was received very cordially, and proceeded to deal with a large number of points interesting to printers generally, and particularly so to managers and overseers.

In introducing his remarks he reminded members that he had previously addressed them on the same subject on November 1st, 1921—nearly two years ago. The delay in giving them a continuation of that address had been due to several important matters which had occupied his attention. One was the converting of Postmasters General to the faith that high postal charges are a crime against trade and commerce and tend to increase unemployment, their effects being particularly disastrous to the printing industry. He had also been drawing attention to the regulations regarding the use of unsealed envelopes in the post, and the possibility of sending printed matter in printed wrappers.

Forms that Assist Efficiency.

Mr. Burchell then proceeded to deal with the subject of printed forms, dockets, etc., for use in the printing trade. The forms he referred to were mainly those he had devised himself and included many pieces of printed matter which assist a manager in the efficient conduct of a printing works. Mr. Burchell, however, had brought for the convenience of members a number of sets of specimen forms used in the Federation Costing System, also the books relating to that System, and he urged the necessity that every manager and overseer should acquaint himself with these.

Proceeding to explain the various forms he used in his own office, he displayed first a set of rules and regulations. It would be thought, he said, that the P.M. and O.A.'s first duty was to help every manager and overseer to become a strict disciplinarian. In this connection he put in a plea for a a standardised set of rules and regulations. Another form shown was one relating to the past history of an employee, and provided a questionnaire which could be sent to a past employer in order to check the statements of an applicant for employment. Emphasis was laid on the need for a time recorder to make possible the accurate registration of the time when each employee entered and left the premises. Examples of time-recording cards, etc., were shown.

Mr. Burchell urged the advisability of the display of rules in each department of the business, and he read rules referring to several departments, which he had produced for use in his own works. A number of forms were displayed dealing with the estimating for and the recording of orders, and the tracing of their passage through the various departments. A point strongly emphasised in connection with forms of estimating was that there should be printed on the back of these certain conditions and recognised customs of the printing trade, subject to which the estimate was made. Mr. Burchell said he had proved in the courts the value of such a precaution. In this connection he drew attention to the disadvantages attaching to litigation under present conditions, and cited a recent case in which £60 costs had been incurred in suing for an amount of £85. He suggested that it would be much preferable if some sort of round-table conference could be instituted whereat points at issue could be submitted to arbitration by practical men.

Charging-Out Periodicals.

A very interesting form exhibited was one for the use of periodical printers, on which could be entered fully detailed particulars relating to every issue of a periodical, including the cost of each individual item of composing, machining, etc., every block used, and all standing matter in hand.

Attention was drawn to the new standard apprenticeship indenture drawn up by the Federation of Master Printers, and Mr. Burchell read an extract therefrom. He also referred to the new apprenticeship agreement in France, and urged the need that there should be agreed and definite conditions relating to all apprentices.

Special emphasis was laid upon the value of a work-in-progress record, a sheet which could be hung up in every department and enable the manager to learn the stage at which each job had arrived and its time of entering and leaving any department.

Country Competition.

Mr. Burchell once more emphasised the extent to which London printers found themselves up against country competition, and he drew attention to the comparative wages table he had produced, indicating the graded wages in the principal towns of the country. It was hoped, he said, that the Federation of Master Printers would find a solution for the problem at their meeting in December next.

The last point touched upon was the subject of profit sharing, towards which a favourable attitude was taken The opinion was expressed that such schemes encouraged good work, and that firms devising satisfactory schemes should find them a good proposition.

At the conclusion the chairman complimented Mr. Burchell on his address, and threw the meeting open for questions and discussion, whereupon a large number of members took advantage of the opportunity to speak.

Mr. E. W. Whittle, the general secretary, commenting on several of the points raised, gave strong approval to the idea of a trade arbitration court, one effect of which, he said, would be to avoid interference by the "Long Vacation," so that if two parties fell out in July it would no longer be necessary to wait until November before the case got into the list, and then probably until the following April before the hearing. Arbitration had already been used in a trade dispute: a leading trade union had recently suggested that the P.M. and O.A. should arbitrate in a certain matter, and the Association's vice-president had acted as adjudicator with satisfaction to both sides. Mr. Whittle mentioned the fact that since Mr. Burchell was enrolled as Member No. 11,299 further members had joined the Parent Association, the latest member's number being 1,300.

Mr. G. H. T. Freeman urged that more should be done to reduce the great variations commonly met with in estimating. He suggested that a definite charge should be made for every estimate.

Mr. M. O'dell put in a plea for the better training of apprentices. There would not, he said, be so large a number of unemployed men down Fleet-street to-day if every master printer, manager and overseer had done their level best to give lads a thorough training whilst they were serving their time.

Mr. W. H. Wicken suggested that the 45 per cent. of a journeyman's wage specified in the standard apprenticeship indenture as the finishing wage of an apprentice was not sufficient.

A number of members expressed astonishment at the multiplicity of forms exhibited by the speaker, and were doubtful as to their economical use.

Mr. Burchell, in briefly replying to points raised, suggested that the dockets and other forms he had exhibited looked formidable in number when collected together, but they seemed few when distributed over the works. In order to avoid getting a lot of superfluous information it was necessary that those collating the details should be, as in his own establishment, practical men. He laid further stress upon the growth of country competition, and warned printers' managers not to wake up in five years' time asking where all the London work had gone to. He concluded by urging P.M. and O.A. members to keep in touch with the new processes coming along, which were going to revolutionise methods of production. He thought it would be helpful if the Association had more get-together conferences, at which every member should be encouraged to contribute his own views and experiences.

A very hearty vote of thanks to Mr. Burchell was moved by Mr. Berry, and seconded by Mr. Wilson. Mr. W. H. Gill, as a colleague of Mr. Burchell's in the early days of the Association, supported the motion, complimenting Mr. Burchell upon the thorough way in which he had laid the Association's foundations, and saying how glad they were to see him back amongst them.

The vote of thanks being carried with acclamation, a brief response from Mr. Burchell brought the meeting to an end.

North Wales Master Printers.

An organising campaign is being held in the North Wales Alliance of the Federation of Master Printers, in the course of which all the printers in the area will be visited. A meeting will be held in each Association, and will be attended by two members of the Alliance not in the Association concerned.

Last week Mr. L. J. Cumner, organising official of the Federation, and Mr. W. Edwards, secretary of the Alliance, were in the Flintshire and Vale of Clwyd Association area, and, following upon a canvass of all the printers, the annual meeting of the Association took place at Rhyl on Thursday.

Mr. J. L. Morris (Mold) presided. Mr. Pugh (*Rhyl Journal*) was elected chairman, and Mr. W. E. B. Jones was re-elected hon. secretary. Messrs. J. L. Morris and D. Williams (Holywell) were appointed representatives on the Alliance executive.

The Federation official and the Alliance secretary reported on their tour of the Association, and certain local difficulties were discussed. Matters coming before the Federation Council were commented upon, and it was agreed to hold the next meeting of the Association on November 5th after the Council has deliberated upon those matters. Arrangements will also then be made for monthly or bi-monthly meetings of the Association.

Mr. Cumner and Mr. Edwards are proceeding to Carnarvon at the end of this week, and a meeting of the Carnarvon Association has been called for October 15th. This will be addressed by Mr. A. E. Goodwin (secretary of the Federation), Mr. W. Powlson (president of the Alliance), and Mr. R. E. Jones (Conway).

Bangor and Anglesey will afterwards be visited, culminating in a meeting at Bangor on October 20th.

PART TIME employment in paper mills has led Plymouth Local Unemployment Committee to seek a modification in existing arrangements.

The Big Press Combine.

Though official confirmation is not forthcoming at the time of writing, it is understood that Sir Edward Hulton has sold his newspaper interests to Lord Rothermere and Lord Beaverbrook.
